ERRATA FOR VOLUME LXXXIII OF THE OFFICIAL GAZETTE.

ANNOUNCEMENTS—VOLUME LXXXIII.

DISCLAIMERS—VOLUME LXXXIII.

TEXT OF THE OFFICIAL GAZETTE, APRIL 5 TO JUNE 28, 1898, INCLUSIVE.

INDEX TO THE DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

DIGEST OF DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

INDEX OF PATENTS AND PATENTEES FOR THE QUARTER YEAR, APRIL TO JUNE, 1898.

ERRATA.

601,746, page 47, in heading, strike out the words "assignor of one-fourth to M. W. Duddy, same place."

602,046, page 150, in heading, residence of inventor, for "Dover, Md." read *Dover, Del.*

602,779, page 419, strike out all after number—title, drawing, and claim—and insert CANCELED.

602,802, page 428, second claim, line 3, for the word and reference-letter "passages *s*" read *passages s and s';* same page and claim, line 5, for "passages *s* and *s'*" read *passage s.*

602,808, page 512, first claim, line 3, after the word "amidonaphthol" strike out the word "and."

602,813, page 513, first claim, line 6, for the word "phenol" read *phényl.*

604,312, page 1038, in heading, name of assignee, for "William B. Lautz" read *William B. Lantz.*

604,317, page 1040, first claim, line 3, second claim, line 2, third claim, line 2, and fourth claim, line 2, for the word "bray" read *brea.*

604,374, page 1062, strike out all after number—title, drawing, and claims—and insert CANCELED.

604,376, page 1268, in heading, name of inventor, for "Edward H. Chappius" read *Edward H. Chappuis.*

605,052, page 1325, in heading, after residence of inventor, insert *assignor to the Stecher Lithographic Company, same place,* and for serial number "544,033" read *544,032.*

605,057, page 1326, in heading, name of assignee, for "Howard & Bullough Machine Company, Limited" read *Howard & Bullough American Machine Company, Limited.*

605,186, page 1394, in heading, residence of assignee, for "New Haven, Conn." read *same place.*

605,631, page 1573, in heading, assignment, name of assignees, for "The Firm of T. Gansel" read *The Firm of I. Gansel.*

605,724, page 1606, in heading, name of last-mentioned patentee, for "Guillaume Giron-Lanauze" read *Guillaume Giroi-Lanauze,* and the residence of the first-mentioned patentee for "Castelmoran" read *Castelmoron.*

605,784, page 1626, strike out the drawing. This figure was inadvertently inserted and the figure pertaining to the case omitted.

605,814, page 1637, twenty-eighth claim, line 7, strike out the word "or."

606,219, page 1820, first claim, line 2, for the word "paramidodimethylanilinthiosulfo" read *paraamidodimethylanilinthiosulfo.*

606,231, page 1831, fifth claim, line 5, after the word "opposite," insert the word *side.*

606,289, page 1853, in heading, name of inventor, for "Eduard Lays" read *Edward Lays.*

606,528, page 1938, twenty-eighth claim, line 4, and twenty-ninth claim, line 3, for the word "removable" read *removably.*

606,594, page 1962, in heading, strike out the words "Patented in Mexico September 8, 1896, No. 907.

Commissioner's decisions, page 746, first column, line 39, after the word "claims" strike out the period and insert a comma, and, same column, line 40, strike out the words "The two patents" and insert the words *and the claims;* same page, second column, line 16, for the word "Neither" read *Either.*

Circular.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 31, 1898.

Attention is called to Order 709, dated November 26, 1898, which is as follows:

It is hereby directed that in the printing of claims of applications for patents the punctuation of the claims as made by applicants be strictly followed, and that the punctuation of the specification made by applicants be not departed from except to cure a manifest absurdity.

This order is still in force.

Examiners are prohibited from making any change in the claims or specification of an application without the consent of applicants or their attorneys; but when amendment becomes necessary the Office will duly advise, by letter, the applicant or his representative before passing a case to issue.

C. H. DUELL,
Commissioner.

Indexes to Periodicals.

The following journals containing indexes to periodical literature may be found on file in the reading-room of the Scientific Library:

Astrophysical Journal, Chicago, a monthly title-index of publications on astrophysical and allied subjects.

Electrical World, New York, a weekly digest of electrical articles.

Engineering Magazine, New York, a monthly title-index of engineering articles in the English language only.

Electrical Engineer, New York, a weekly synoptical index of electrical literature, American and foreign.

Journal of the United States Artillery, a bimonthly title-index of current artillery literature.

Proceedings of the Physical Society of London, monthly abstracts of the principal articles on physics published in the American and Continental journals since January 1, 1898.

School of Mines Quarterly, New York, a quarterly synoptical index of articles on analytical chemistry and title-index of metallurgical literature.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., March 29, 1898.

SIR: The Secretary of the Interior has ordered that Thomas J. Stafford, of Creston, Iowa, be not recognized after this date as agent or attorney in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully,

EDWARD M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., March 30, 1898.

SIR: The Secretary of the Interior has ordered that J. D. Bacon, of Troy, Ind., be not recognized after this date as agent or attorney in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully,

EDWARD M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. Terms: To subscribers within the United States, Canada, and Mexico, $5 per annum; to foreign subscribers, $10; single copies, 10 cents; if mailed to foreign countries 10 cents additional for postage; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $6.75 per volume. *Payment in advance.* No subscription will be received for less than three months. All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Renewal of Forfeited Cases.

Rule 178. When the patent has been withheld by reason of non-payment of the final fee, any person, whether inventor or assignee, who has an interest in the invention for which such patent was ordered to issue may file a renewal of the application for the same invention; but such second application must be made within two years after the allowance of the original application. • • •

Rule 179. In such renewal the oath, petition, specification, drawing, and model of the original application may be used for the second application; but a new fee ($15.00) will be required. • • •

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business March 29, 1898.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended.	No. of applications awaiting action.
	In arrears—Between two and three months.

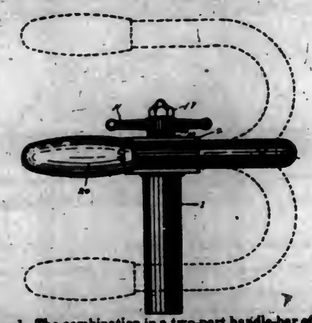
PATENTS

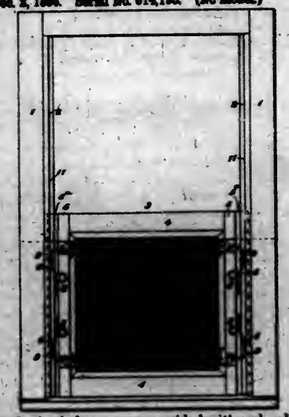


GRANTED APRIL 5, 1898.

601,623. WHEEL-CLEANER FOR VEHICLES. MARVIN ASH, Forest City, S. D. Filed June 3, 1897. Serial No. 639,318. (No model.)

Claim.—The combination with a vehicle running-gear 1 and its wheels 2, 2 of the V-shaped spring-metal bracket 4 fixed to the running-gear by the bolt 5 and adjustable clamps 6, 6 and leaving the free ends of its integral diverging arms 6, 6 extending across the path of the wheels, and the cast-metal shoes 8, 8 adjustably secured on the free ends of said arms, by means of the set-screws 12, 13 and having their faces contiguous to said wheels formed with a diagonal recess 9 and parallel ears 10, 10 terminating in beveled edges 12, 12 substantially as shown and described.

601,624. ADJUSTABLE HANDLE-BAR FOR BICYCLES. GEO. M. BEARD, Angola, Ind. Filed Oct. 24, 1896. Serial No. 609,944. (No model.)



Claim.—1. The combination in a two-part handle-bar of the post 1; the handle-bar head 2 secured in said post by a tubular screw-threaded stem, and having the circular openings 3 arranged in parallel relation for the purpose described, and having its central portion horizontally slotted to admit of clamping said handle-bar when mounted therein; the handle-bar sections 19 rotatably mounted in said openings 3 and provided upon their inner ends with the opposite and coincident screw-threaded annular faces 23 adapted to engage the adjusting-screw; the vertical adjusting-screw 5 rotatably mounted in said head as shown, between the said handle-bar sections and adapted for an actuating engagement with said faces 23, and provided with a reduced screw-threaded extension 8 having a longitudinal slot 9; and a hand-lever 11 mounted on said extension by a screw-threaded connection and provided with a spring-pressed catch-bolt loosely mounted therein as described and adapted for a holding engagement with said slot 9, all substantially as described.

2. The combination of the head 2 centrally slotted as shown, and provided with handle-bar openings 3 in parallel arrangement and having a vertical central opening for the adjusting-screw; the handle-bar sections provided upon their inner ends with the annular threaded faces 23 adapted for a simultaneous actuating engagement with the adjusting-screw when rotatably mounted in said openings; the handle-bar-adjusting screw 5 rotatably mounted in said vertical opening and adapted for an actuating engagement with the said handle-bar sections and provided with a screw-threaded stem 8 longitudinally slotted as shown; the plates 10 loosely mounted on said stem and having a plurality of balls 18 arranged as shown, for the purpose specified; and a hand-lever 11 rotatably mounted on said stem by a screw-threaded connection and having a spring-pressed catch 12 arranged therein to holdingly engage said slotted stem for the purpose of rotating the said adjusting-screw 5, and a screw-threaded cap 17 adapted to limit the upward movement of said hand-lever, all substantially as described.

3. The combination of a centrally slitted or slotted handle-bar head 2 having a central vertical perforation for the adjusting-screw, a circular opening 3 for the handle-bar, so arranged as to communicate with said vertical perforation, and having a pendent supporting-stem; a one-piece handle-bar rotatably mounted in said opening and provided midway its ends with an annular concave screw-threaded face 23; the adjusting-screw 5 rotatably mounted in said vertical perforation and adapted to form an actuating engagement with said handle-bar, and provided with a screw-threaded stem 8; the plates 10 mounted on said stem as described for the purpose specified; and a hand-lever 11 rotatably mounted on said stem by a screw-threaded connection, and having a spring-pressed catch 12 arranged therein to holdingly engage said stem for the purpose of rotating the said adjusting-screw 5, and a screw-threaded cap 17 adapted to limit the upward movement of said hand-lever, all substantially as described.

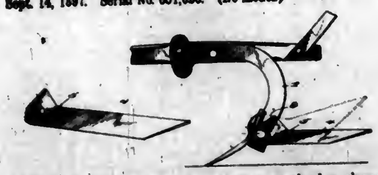
601,625. WINDOW-SCREEN. GEORGE A. RIDEOUT, Keene, N. H. Filed Dec. 2, 1896. Serial No. 614,195. (No model.)

Claim.—1. A window-screen provided with a plurality of retaining and guiding springs at one or both sides, each of which embodies a coil located in a recess and projects outwardly therefrom to form a bearing and thence inwardly through the frame, said outwardly-projecting portion being normally inclined with reference to the edge of the frame and separated laterally from said edge by a space adapted to receive a track-molding or flange.

2. A window-screen provided with a plurality of retaining and guiding springs at one or both sides, each of which embodies a coil of one or more turns located in a cylindrical recess in the frame and extends therefrom outwardly to form a bearing and thence inwardly through the frame, said outwardly-projecting portion being normally inclined with reference to the edge of the frame and separated laterally from said edge by a space adapted to receive a track-molding or flange.

3. A window-screen comprising a frame, one or both of the side portions of which has a plurality of guideways or recesses one side of each of which consists of a metal plate or strip having offset retaining edges embedded in the frame, and retaining and guiding springs each of which has one end inserted in the frame and extends outwardly at an acute angle to the edge of the frame to form a bearing and thence inwardly through the corresponding recess or guideway in the frame.

4. A window-screen frame one or both of the side pieces of which has a plurality of guideways or recesses, one side of each of which consists of a strip or plate having offset edges embedded in the frame, in combination with a plurality of springs each of which has one end rigidly connected to the frame and has a coil adjacent to said end which is located in a corresponding recess, said spring extending outwardly from said coil to form a bearing and thence inwardly through the corresponding recess or guideway.



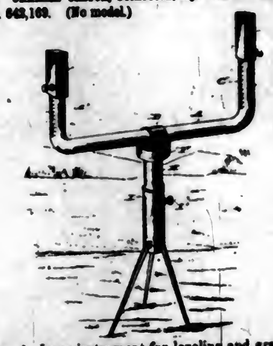
5. The combination with a window-casing having a molding at each side, provided with a laterally-projecting ledge, of a screen-frame the extreme width of which is materially less than the inside width of the casing, said frame having a plurality of retaining and guiding springs at each side, each of which embodies a coil located in a recess in the frame and projects outwardly against the ledge of the molding and thence inwardly through a guideway in the frame, said outwardly-projecting portion being inclined with reference to the edge of the frame.

601,626. BOWLING-ALLEY. EDWARD BROOKS, Milton, Mass. Filed Feb. 23, 1897. Serial No. 624,574. (No model.)

Claim.—In a bowling-alley an electric circuit broken at the spot where the pin stands; two binding-posts set upon the circumference of a suitably-sized circle struck from the center of the spot, their tops flush with the surface of the alley and ninety degrees apart and a pin having a metal ring inlaid upon the bottom thereof flush with its bottom surface and of suitable size to connect the two binding-posts, all arranged substantially as described.

601,627. SWEEP. ANDREW J. BROWN, Bold Spring, Ga. Filed Sept. 14, 1897. Serial No. 651,636. (No model.)

Claim.—In combination, a plow foot or standard, a plow point or shovel secured to the lower end of the standard and projecting beyond the side thereof, a sweep comprising a blade having its inner end bent about at right angles upon an oblique line and terminating in straight edges disposed at different relative angles to each other and adapted to underlap and touch the rear side of the said point or shovel, and a fastening-bolt securing the sweep to the standard and passing through an opening in the bent end of the blade, substantially as and for the purpose set forth.



601,628. CARPET-SWEEPER. EMILY B. BROWNE, Dedham, Mass. Filed Nov. 5, 1897. Serial No. 657,499. (No model.)

Claim.—1. In a carpet-sweeper, in combination with the driving-wheels, a rotary brush in two sections, one section inclosed in a frame between two pairs of driving-wheels and the other section projecting beyond the driving-wheels and inclosed in a casing for receiving the dirt, substantially as described, for the purposes specified.

2. In a carpet-sweeper, in combination with the driving-wheels, a rotary brush in two sections, one section inclosed in a frame between two pairs of driving-wheels and the other section projecting beyond the driving-wheels and inclosed in a casing, said casing being adjustably secured to the main frame of the sweeper, substantially as described for the purposes specified.

601,629. COMBINED SPIRIT-LEVEL AND GRADING INSTRUMENT. CHARLES CASTOR, Princeton, Ky. Filed June 24, 1897. Serial No. 642,169. (No model.)

Claim.—1. In an instrument for leveling and grading, the combination of the tripod-cylinder, the tube adjustably held therein, and a level mounted to turn on said tube, said level consisting of a glass tube having the upturned ends having graduated scales thereon, and an adjustable cap on each upturned end, substantially as shown and described.

2. In a level, the combination of the tripod-cylinder, a level mounted thereon so that it can be turned, said level consisting of a glass tube having the upturned ends with graduated scales, and an adjustable cap on each upturned end of the glass tube, and means for securing said caps at any desired adjustment, substantially as described.

601,630. PROTRACTOR. ARTHUR W. CRAIG, Fortress Monroe, Va. Filed May 24, 1897. Serial No. 637,837. (No model.)

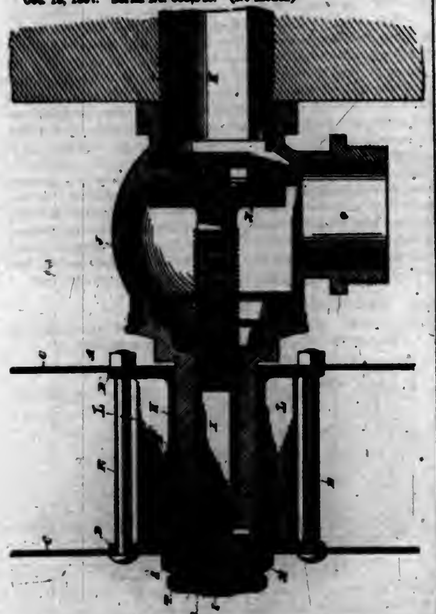
Claim.—1. A protractor having the curve whose equation is $y=(x-a)\tan.\frac{\pi x}{2a}$, substantially as shown and for the purpose described.

2. A protractor having two curved plotting edges, one a semicircle and the other a curve whose equation is $y=(x-a)\tan.\frac{\pi x}{2a}$, as and for the purpose described.

3. An instrument designed for use as a protractor and for the multisection of angles, having for its exterior plotting edge the curve whose equation is $y=(x-a)\tan.\frac{\pi x}{2a}$, and for its interior plotting edge a semicircle, both curves having a common center, and both being graduated substantially as shown and described.

4. An instrument designed for the construction of the equivalent squares of given circles and conversely for the construction of the equivalent circles of given squares, having a plotting edge which at D is a line perpendicular to the base of the instrument, coincides with a point whose equation is $y=(x-a)\tan.\frac{\pi x}{2a}$, as and for the purpose described.

5. An instrument designed for the construction of cycloidal curves having an exterior edge constructed from the curve whose equation is $y=(x-a)\tan.\frac{\pi x}{2a}$, reference-line A B and point D and its face graduated, all substantially as shown and described.



6. In a drawing instrument, a frame-plate having a curved exterior edge, and a semicircular interior edge, the centers of these curves coincident, and a base-plate A, B, the base-line A, B, and the maximum vertical of the exterior curve of the frame-plate having the ratio $\frac{A\,B}{O\,D}=\pi$, and the face of the frame-plate being ruled and graduated, all substantially as shown and described.

601,631. LIFTING DEVICE. WILLIAM T. B. CLEMM, Pocahontas, Va. Filed Feb. 2, 1897. Serial No. 621,617. (No model.)

Claim.—The herein-described lifting device comprising two similar bars one of which is provided with keepers through which the other is adapted to slide, cross-heads mounted upon the upper end of each of said bars, angularly-projecting plates secured to each of said cross-heads, each of said plates being rectangular in form and being semicircular at the free end, the free end of each plate being beveled on one side, each being beveled on the side opposite to the other, the said plates being substantially the same length whereby the said under plate projects beyond the said upper plate at the end thereof, and a brace connecting said under plate with one of the said keepers, and a hook mounted in the upper end of the said sliding bar to which the said upper plate is secured substantially as and for the purpose described.

601,632. HOSE-REEL. EDWARD CLIFF, Newark, N. J. Filed Oct. 18, 1897. Serial No. 655,546. (No model.)

Claim.—1. In combination with the water-supply apparatus having the valve, projecting valve-stem and exposed hose-attaching nozzle, the reel adapted to operate said stem, means connecting the reel with said stem but permitting said stem to move longitudinally, means restraining said reel, while revolving, against traveling with said stem, and the hose at one end connected with said exposed nozzle and thence while doubled at about its center wound upon said reel; substantially as set forth.

2. In combination with the water-supply apparatus having the valve, valve-stem and exposed hose-attaching nozzle, the sleeve around said stem, the reel mounted on said sleeve, means for preventing the reel while revolving from traveling longitudinally on said sleeve, means connecting said reel with said stem to transmit the motion of the reel to said stem to operate the valve, and the hose at one end connected with said exposed nozzle and thence while doubled at about its center wound upon said reel; substantially as set forth.

3. In combination with the water-supply apparatus having the valve, projecting valve-stem, and exposed hose-attaching nozzle, the sleeve connected with said water-supply apparatus and having an internal thread, the reel mounted upon said sleeve, means connecting a polygonal portion of said valve-stem with said reel but permitting said stem during the revolving of the reel to travel longitudinally, means preventing said reel from having a traveling motion while revolving on said sleeve, and the hose at one end connected with said exposed nozzle and thence wound upon said reel; substantially as set forth.

4. The water-supply apparatus having a hollow sleeve, a valve and a valve-stem projecting through said sleeve, combined with a reel mounted to turn axially upon said sleeve, the sleeve R, having a polygonal aperture fitting upon a polygonal portion of said valve-stem and provided at one end with a head and at its other end with a nut, whereby said sleeve may be clamped against a portion of said reel to connect the reel and valve-stem, and suitable hose wound upon said reel; substantially as set forth.

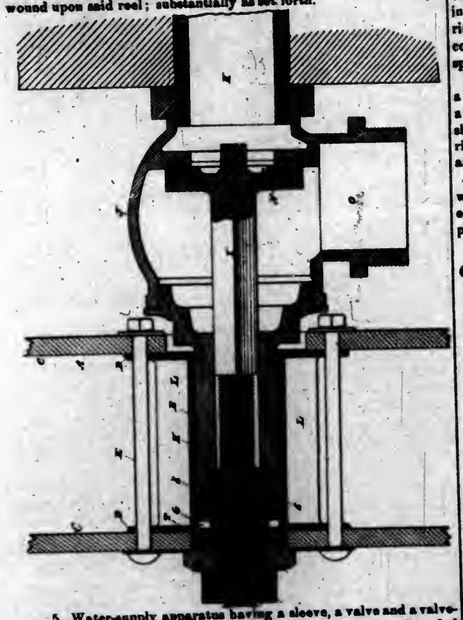
5. In combination with the water-supply apparatus having a sleeve, a valve and a valve-stem projecting into said sleeve and having a threaded portion to engage the thread of said sleeve and also a polygonal portion, the reel mounted to revolve upon said sleeve and otherwise stationary therewith, the sleeve R having a polygonal aperture receiving the polygonal portion of said valve-stem and having also the head G within the bore of said reel, the nut S on said sleeve R for clamping a portion of said reel against said head, and hose suitably wound upon said reel; substantially as set forth.

6. In combination with water-supply apparatus having the internally-threaded sleeve, the valve and the valve-stem projecting into said sleeve and being threaded in one portion and polygonal in cross-section in another portion, the reel mounted to revolve upon said sleeve and keyed thereon and extending outward beyond the outer end of said sleeve, the sleeve R having a polygonal aperture receiving said valve-stem and provided with the head G intermediate the outer end of said sleeve and the outer portion of the reel, and the nut upon said sleeve R to clamp said outer portion of the reel against the said head G; substantially as set forth.

7. In combination with water-supply apparatus having a valve, a sleeve and a valve-stem projecting through said sleeve, the reel receiving within its hub said sleeve and valve-stem, means directly on and carried by said valve-stem for detachably connecting said stem with said reel so that said stem may receive the motion of said reel, and means for preventing said reel from traveling longitudinally with said stem; substantially as set forth.

8. In combination with water-supply apparatus having a sleeve, a valve and a valve-stem projecting through said sleeve, the reel mounted upon said sleeve, a key securing said reel upon said sleeve but permitting of the revolving motion of said reel around said sleeve, the sleeve R upon and carried by a polygonal portion of said valve-stem, and means for connecting the said sleeve R to the reel; substantially as set forth.

601,633. HOSE-REEL. EDWARD CLIFF, Newark, N. J. Filed Oct. 18, 1897. Serial No. 655,547. (No model.)

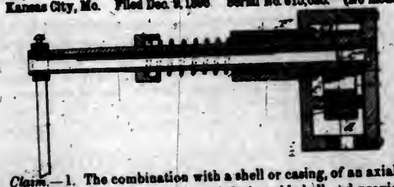


Claim.—1. In combination with the water-supply apparatus having the valve, projecting valve-stem and exposed hose-attaching nozzle, the reel adapted to operate said stem, means connecting the reel with said stem to operate the same and the hose at one end connected with said exposed nozzle and thence, while doubled at about its center, wound upon the said reel, the said reel and the said valve-stem being arranged at an angle of about forty-five degrees; substantially as and for the purposes set forth.

2. In combination with water-supply apparatus having a tubular sleeve, a valve and a valve-stem projecting into said sleeve, the reel mounted to revolve upon said sleeve, means connecting said reel with the valve-stem for the purpose of operating the valve from the reel, and hose suitably wound upon the reel, said valve-stem, said sleeve and said reel being arranged at an angle of about forty-five degrees; substantially as shown and described.

3. In combination with water-supply apparatus having a stationary sleeve, a valve and a valve-stem projecting through said sleeve, the reel mounted to turn axially upon said sleeve, the revoluble sleeve having a threaded bore to receive the threaded portion of the valve-stem, and means for connecting said revoluble sleeve to the reel; substantially as set forth.

4. In combination with water-supply apparatus having a sleeve, a valve and a valve-stem projecting through said sleeve, a reel mounted to turn axially upon said sleeve, the revoluble sleeve having a threaded bore to receive the valve-stem and provided with the flange, the nut for connecting said flange to the reel so that said reel



and said sleeve R may revolve together, means for preventing said revoluble sleeve from traveling longitudinally, and hose suitably wound upon said reel; substantially as set forth.

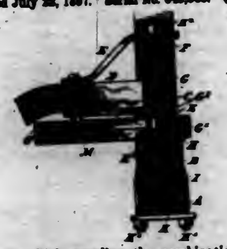
5. Water-supply apparatus having a sleeve, a valve and a valve-stem projecting through said sleeve, said valve-stem having a threaded portion and a polygonal portion and said sleeve having a polygonal bore to engage the polygonal portion of said valve-stem, combined with the reel mounted to turn axially upon said sleeve, the threaded sleeve mounted to revolve axially on and receiving the threaded portion of said valve-stem, means for detachably connecting said threaded sleeve to the reel in order that said reel and sleeve may revolve together, and hose suitably wound upon said reel; substantially as set forth.

6. In combination with water-supply apparatus having a sleeve, a valve and a valve-stem projecting into said sleeve, a hose-reel mounted to turn axially on said sleeve, means for connecting said reel to said stem for operating the latter and the valve, and means for preventing said stem from turning axially during its longitudinal movement; substantially as set forth.

601,684. COCK OR FAUCET. JOHN F. COTTER and JOSEPH TAGER, Kansas City, Mo. Filed Dec. 9, 1896. Serial No. 615,095. (No model.)

Claim.—1. The combination with a shell or casing, of an axially-turning, hollow, outlet-stem fitted tightly in said shell and provided at its inner part with lateral ports which open into the bore of longitudinal passage in said shell, a movable guide situated at one side of said stem, within the shell, and an endless band or ring-packing stretched around said guide and the stem and fitted tightly to the stem to expose or cover the lateral ports in said stem, as set forth.

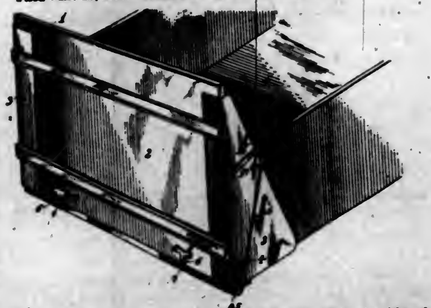
2. In combination, a hollow outlet-stem provided with lateral egress-ports, an antifriction-roller forming a guide which is situated at one side of said stem, and a movable band or packing fitted around said roller and the stem, as set forth.



3. In combination a hollow outlet-stem having a lateral egress-port, a guide-roller and an endless packing reinforced by external metallic bands and stretched around said guide-roller and the outlet-stem to expose or close the ports in the latter, as and for the purposes described.

4. The combination with a shell having a gland, a guide-roller within the shell, and an endless ring or band fitted to the guide-roller, of a hollow outlet-stem extending through said gland and having its inner perforated end partially encompassed by said endless band or ring, a packing around the stem and within the gland, a spring to compress said packing, and means for varying the pressure of the spring, substantially as and for the purposes described.

5. In combination, a shell or casing provided with a stuffing-box, a hollow outlet-stem stepped in said shell and having an egress-port, a removable top or cap for said shell, a guide-roller journaled in the shell independently of the top or cap plate thereof, and a band or ring-packing fitted around the guide-roller and the outlet-stem, as and for the purposes described.



6. In combination, a shell or casing, a hollow outlet-stem stepped within said shell, a guide-roller situated at one side of said stem, an endless band or ring-packing, and means for moving said band or packing, as set forth.

601,685. VEHICLE-COUPLING. JERRY CROWLEY, Cabinlove, W. Va. Filed July 22, 1897. Serial No. 645,505. (No model.)

Claim.—In a vehicle-coupling, the combination with the axle, the lower bolster, the upper bolster and the spring, of the fifth-wheel, the two plates of which are supported between the upper and lower bolsters, the clip I, securing the lower bolster to the axle and provided with a bell-shaped recess and a central opening in its upper end and with depending flanges I' lying transversely upon the upper bolster, a flat plate resting upon the upper bolster and inclosed within the recess in the upper part of the clip, between the flanges I', a bolt passing through the upper bolster and the spring and provided with a head at its lower end, with rounded outer surface to rest upon the plate H', said head being countersunk to fit the recess H, the bolt being thickened under the head to form a shoulder G^3, a boot clip upon the bolt, with its lower end resting upon said shoulder, passing up around the upper bolster and spring and having its upper end fitted upon the upper end of the bolt, and a nut K' threaded upon the bolt above the upper end of the clip E, all substantially as described.

601,686. SHOVELING-BOARD. NEWTON A. CRIMAN, Decatur, Ill. Filed June 28, 1897. Serial No. 642,645. (No model.)

Claim.—1. The combination with an end-gate, of the shouldered links pivoted at one end to said gate and arranged thereon for the opposite shouldered end of the link to engage with the free edge of the gate, and a rod connected to the link beyond its shouldered end, whereby the link loosely connects the rod to the gate and permits a limited vertical adjustment of the rod relative to the gate to accommodate the latter to wagon-bodies of different heights, substantially as described.

2. The combination with a wagon-body and an end-gate of the loose links or clips pivoted to said end gate and provided with flanges which embrace the gate and with shoulders to limit the play or movement of said links, hangers on said body, and rods loosely connected to the free ends of the links and engaging with the hangers, for the purposes described, substantially as set forth.

3. A hinge for an end-gate or shoveling-board, comprising the separable members, one of which is provided with prongs situated at right angles to each other to be embedded in a wagon-body, as and for the purposes described.

4. The combination with a wagon-body and an end-gate of the separable hinge comprising a member, 7, fixed to said wagon-body and provided with a rearwardly-extending pintle and with the lateral extending head at the rear extremity of said pintle, and the plate-like member, 8, fastened to the end-gate and having its curved and forked members, 21, arranged to straddle the pintle to rest thereon; the forked parts of said hinge member, 8, being adapted when the gate is in a vertical position to turn under the head of the pintle and prevent vertical displacement of said end-gate, substantially as described.

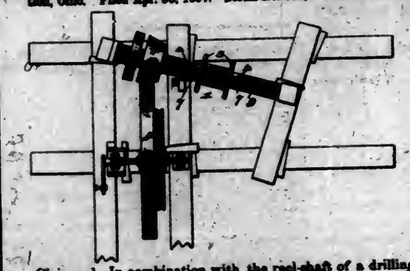
5. A hanger for an end-gate and shoveling-board comprising a horizontal bracket member constructed for application to the upper edge of the wagon-body, and an outwardly-projecting horizontal arm fastened to said bracket member to lie substantially at right angles thereto and adjustable longitudinally thereon, substantially as described, for the purposes set forth.

6. A hanger comprising a horizontal bracket member, an outwardly-projecting forked arm applied laterally to the bracket member to lie substantially at right angles thereto, and means for clamping said arm rigidly and adjustably to the bracket member, as and for the purposes described.

7. An end-gate hanger, comprising a horizontal bracket constructed for application to the upper edge of a wagon-body and provided with an exposed corrugated face, a horizontal fulcrum-arm extending outwardly from said bracket and having a corrugated inner end which is interlocked with said corrugated face of the bracket, and a bolt which unites the arm and bracket rigidly together and is adjustable with said arm in a horizontal direction on the bracket, substantially as and for the purposes described.

8. A hanger comprising a bracket member provided with angular arms on one side and having a corrugated face and a slot, an arm provided with fingers and with a corrugated face-plate arranged in such relation to one of the fingers as to form a shoulder, and a bolt with its head fitted in the slot of the bracket member and passing through the arm to hold the latter adjustably on said bracket member, as and for the purposes described.

9. An end-gate hanger, comprising an elongated horizontal bracket constructed for application to the upper edge of a wagon-body, a horizontal fulcrum-arm extending outwardly from the bracket substantially at right angles thereto and provided with forks arranged to confine between themselves a locking-rod, and means for clamping said bearing-arm adjustably to the bracket, substantially as and for the purposes described.



601,687. COMBINED TABLE AND GAME-COUNTER. DANIEL B. CUTLER, Searsburg, Vt. Filed Sept. 16, 1897. Serial No. 651,942. (No model.)

Claim.—1. The combination with a table-top provided with a circular recess and a plurality of concentric slots extending through the bottom thereof, of a dial around the edge of the recess, a transparent plate over said recess, an arbor mounted at the center of the recess, a plurality of hands on said arbor, and pins projecting from the under side of said hands and working in and extending through said slots, substantially as and for the purpose specified.

2. The combination with a table-top provided with a circular recess and a plurality of concentric slots extending through the bottom thereof, of a dial around the edge of the recess, a transparent plate over said recess, an arbor mounted at the center of the recess, a plurality of hands on said arbor, pins projecting downward from the under side of said hands and working in and extending through said slots, and a thumb-nut on the lower end of the arbor beneath the table-top, substantially as shown and described.

601,688. SAND-LINE SPOOL. RUSSELL A. DAYTON, Burton Station, Ohio. Filed Apr. 30, 1897. Serial No. 634,569. (No model.)

Claim.—1. In combination with the reel-shaft of a drilling-rig, of a portable sand-line spool comprising a spool-body having a large-sized longitudinal bore and provided at each end with a series of regularly-spaced offset exteriorly-arranged fastening means adapted to engage with the shaft, said spool being separate and independent of the shaft and adapted to be secured thereon at different points, substantially as set forth.

2. A portable sand-line spool for well-rigs comprising a cylindrical spool-body with a large longitudinal opening or bore and provided with circular end guard-flanges, and a circular series or plurality of offstanding legs exterior to said flanges, and set-screws mounted in said legs and adapted to impinge on the shaft receiving the spool, substantially as set forth.

601,689. CLAMP FOR HANDLING HYDRAULIC HOSE. PHILIP J. DOYLE, Memphis, Tenn. Filed June 11, 1897. Serial No. 640,297. (No model.)

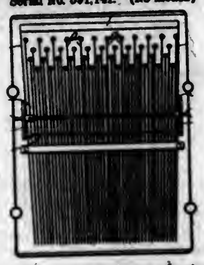
Claim.—1. A hinged clamp for handling hose, constructed as herein described, with a pair of jaws 1, 1, of semicircular form to fit the hose or pipe, hinged together at 2, 2, and provided with a spring-pawl 8 for securing the jaws in closed position, and with handles 5, 5, for carrying the hose located tangentially to the clamp.

2. The combination of the jaws 1, 1, hinged together at 2, formed at their extremities with sockets 3, 4, the handles 5, 5, secured in said sockets, the arm 7 projecting from the socket 3, the spring pawl 8 mounted in the said arm and the cross-bar 11 in the socket 4 with which said spring-pawl engages, as and for the purposes described.

3. The combination of the hinged jaws 1, 1, sockets 3, 4, thereon, handles 5, 5 in said sockets, latch device 7, 8, 9, and cross-bar 11 for securing the sockets in closed position, as and for the purposes described.

4. The combination of the hinged jaws 1, 1, sockets 3, 4, handles 5, 5, and suitable catch device 7, 8, 9, 11, and the hoisting-stirrup 14 secured to the socket 3 for raising the hose by tackle applied to the clamp, substantially as described.

601,640. METHOD OF TREATING ORES CONTAINING GOLD, SILVER, OR COPPER. ALEXANDRE BYARD, Paris, France. Filed May 3, 1897. Serial No. 635,719. (No specimens.)



Claim.—1. The method herein described of treating ores or other matters containing gold, silver or copper, by forming a weak solution of hydrochloric acid with a small quantity of a compound of an alkali metal or alkali-earth metal, such as permanganate of potash, in such proportions that chlorin is not generated, thereby producing a stable mixture which will dissolve the specified metals in the cold, and treating the ores or metalliferous matters with said mixture, substantially as set forth.

2. The treatment of ores or other matters containing gold, silver or copper, by means of a weak solution of hydrochloric acid in conjunction with a permanganate salt of an alkali metal or earth metal, the said materials being used in such proportion as to produce a liquid free from the odor of chlorin, substantially as described.

3. The treatment of ores or other matters containing gold, silver or copper, by means of a weak solution (about three per cent.) of

hydrochloric acid to which is added, while cold, about four hundred grams of permanganate of potash per one thousand kilos of dissolvent, as set forth.

601,641. COUNTING APPARATUS FOR TYPE-WRITERS OR LIKE MACHINES. WILLIAM FIRS, Wellingborough, England. Filed May 11, 1896. Serial No. 591,141. (No model.)

Claim.—A counting or registering mechanism for a type-writer consisting of two rotating wheels geared into one another and connected to a suitable counting or registering mechanism, an oscillating lever-arm oscillating between two teeth one on each wheel so that by the oscillation to one side the arm acts on the tooth of one wheel to move it and consequently both wheels through one-half a tooth-space and by the oscillation to the other side the arm then acts on a tooth of the other wheel and completes the motion through a complete space, a means for actuating the lever-arm in one direction from the letter keys, and a means for actuating the lever-arm in the reverse direction from the spacing-key.

601,642. STOVE-TRUCK. DAVID L. FOGLEMAN, Danville, Pa. Filed Dec. 13, 1897. Serial No. 661,643. (No model.)

Claim.—1. A device of the class described comprising a truck-frame mounted upon wheels, a centrally-arranged master-wheel journaled on the truck-frame, a vertically-movable supporting-frame provided with depending screws, pinions provided with threaded openings receiving the screws, said pinions meshing with the master-wheel and means for rotating the master-wheel whereby the supporting-frame is raised and lowered, substantially as described.

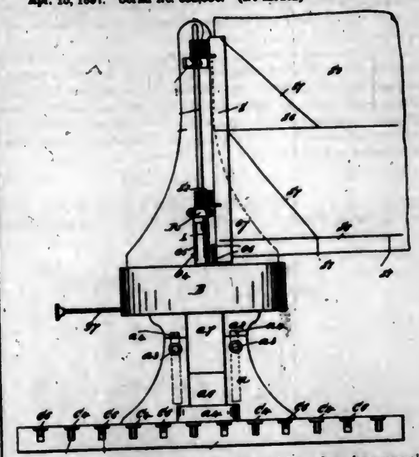
2. A device of the class described comprising a truck-frame mounted upon wheels, a vertically-movable supporting-frame, screws connected with the supporting-frame, pinions provided with threaded openings to receive the screws, a master-wheel arranged within the pinions and meshing with the same, and an operating-shaft provided with a pinion meshing with the master-wheel, substantially as described.

3. A device of the class described comprising a truck-frame mounted upon wheels, a vertically-adjustable supporting-frame, vertical screws supporting the same, pinions bearing against the truck-frame and provided with threaded openings receiving the screws, a master-wheel arranged within the pinions and provided at its periphery with teeth meshing with the same, said master-wheel having teeth on one of its faces, a longitudinal shaft journaled in suitable bearings and extending to the front of the truck, and a pinion mounted on the rear end of the shaft and meshing with the teeth on the face of the master-wheel, substantially as described.

4. A device of the class described comprising a truck-frame mounted upon wheels and composed of side bars provided at their inner faces with sockets, and cross-bars having upturned ends bearing against the inner faces of the side bars and secured in the said sockets, a vertically-adjustable supporting-frame, and means for raising and lowering the same, substantially as described.

601,643. CAR-COUPLING. GEORGE J. FORREY, Carlisle, Pa., assignor of one-half to S. L. Diven, same place. Filed Dec. 20, 1896. Serial No. 617,343. (No model.)

Claim.—1. In a car-coupling, the combination of a draw-head, a knuckle having an arm pivoted centrally of the draw-head, and a spring-actuated block engaging the arm of the knuckle to cushion the same and limiting the pivotal movement thereof, substantially as described.



2. In a car-coupling, the combination of a draw-head, a knuckle pivoted centrally of the draw-head and provided with a rearwardly-extending lug, and a spring-actuated block having a recess receiving the lug and forming opposite shoulders to limit the swing of the knuckle, substantially as described.

3. In a car-coupling, the combination of a draw-head provided at its top and bottom with centrally-arranged longitudinal slots, a knuckle provided with an arm having a perforation, a knuckle-pin arranged in said slots and passing through the perforation of the knuckle, a spring-actuated block engaging the arm of the knuckle to cushion the latter and limiting the swing thereof, and a transverse spring engaging the knuckle, substantially as described.

4. In a car-coupling, the combination of a draw-head, a knuckle pivoted centrally of the draw-head and provided at its outer side with a recess, a rib arranged in the recess, a projection mounted on the draw-head opposite the recess, a transverse spiral spring having its outer end mounted on the projection, and a plug arranged in the inner end of the spiral spring and having a grooved head to engage the said rib, substantially as described.

5. In a car-coupling, the combination of a draw-head, a knuckle having its arm pivoted centrally of the draw-head and capable of a limited movement longitudinally of the same, a longitudinal spring for cushioning the knuckle, a transverse spring engaging the latter, and means for connecting the knuckle with a car, substantially as described.

601,644. MUSIC-TURNER. REBA W. FUNK, Canton, Minn. Filed Apr. 15, 1897. Serial No. 632,330. (No model.)

Claim.—1. A music-leaf turner comprising a base box or casing, a supplemental box or casing mounted thereover, music-frames revolubly supported above said supplemental box or casing, a tubular and revoluble cylinder supported above said supplemental box or casing, and provided with a slot in one side thereof, and an extension which projects downwardly into said supplemental box or casing, a screw which passes upwardly through said extension and through said cylinder, and on which is mounted a block which is provided with an arm which projects through said slot, and which is adapted to operate in connection with lugs or projections formed on said music-frames, substantially as shown and described.

2. In a music-turner, a base box or casing provided with two spring-operated shafts, each of which is provided with keys, a supplemental box or casing mounted above said base box or casing, a shaft mounted above said supplemental box or casing, and provided with music-supports which are revolubly mounted thereon, a revoluble cylinder mounted below said shaft and provided with an extension which projects into the supplemental box or casing, a screw which passes upwardly through said extension and through said cylinder, a movable block mounted on said screw and provided with an arm which projects through a vertical slot formed in said cylinder, a spring-drum mounted in said supplemental box or casing and operative devices connected with said parts whereby the music-supports may be turned by operating the shafts in the base box or casing, substantially as shown and described.

3. In a music-turner, a base box or casing, provided with two spring-operated shafts, each of which is provided with keys, a supplemental box or casing mounted above said box or casing, a shaft mounted above said supplemental box or casing, and provided with music-supports which are revolubly mounted thereon, a revoluble cylinder mounted below said shaft and provided with an extension which projects into the supplemental box or casing, a screw which passes upwardly through said extension and through said cylinder, a movable block mounted on said screw and provided with an arm which projects through a vertical slot formed in said cylinder, a spring-drum mounted in said supplemental box or casing, and operative devices connected with said parts whereby the music-holders may be turned by operating the shafts in the base box or casing, said supplemental box or casing being vertically adjustable, substantially as shown and described.

4. A music-turner comprising a base box or casing, spring-operated shafts mounted therein, each of which is provided with keys, a supplemental box or casing mounted above said base box or casing, and connected therewith, operative shafts connected with the shafts in the base box or casing, and projecting upwardly into said supplemental box or casing, a shaft supported above said supplemental box or casing and provided with music-supports which are revolubly mounted thereon, a revoluble cylinder mounted below said shaft, and provided with a slot in one side thereof, and an extension which projects downwardly into the supplemental box or casing, a screw which passes upwardly through said extension and through said cylinder, a block mounted on said screw within said cylinder and provided with an arm which projects through said slot and which is adapted to operate in connection with said music-supports, a spring-drum mounted in said supplemental box or casing, and operative devices whereby the music-holders may be operated by means of said spring-operated shafts, substantially as shown and described.

5. A music-leaf turner, comprising an oblong box or casing, spring-operated shafts mounted in said box or casing and provided with keys, a supplemental box or casing supported above said box or casing, operating-shafts connected with the shafts in the base box or casing, and extending upwardly into the supplemental box or casing, a spring-drum mounted in said supplemental box or casing, music-frames revolubly supported above said supplemental box or casing, a cylinder revolubly supported above said supplemental box or casing, and provided with an extension which projects downwardly therein into, a screw which projects upwardly through said extension, and through said cylinder, and provided with a block which is mounted thereon, on which is formed an arm which projects through a slot formed in said cylinder, said arm being adapted to operate in connection with lugs or projections formed on the music-frames, and operating devices whereby said operating-shafts may be manipulated so as to turn said music-frames in either direction, substantially as shown and described.

6. A music-leaf turner comprising a base box or casing, a supplemental box or casing mounted thereover, music-frames revolubly supported above said supplemental box or casing, a tubular and revoluble cylinder supported above said supplemental box or casing, and provided with a slot in one side thereof, and an extension which projects downwardly into said supplemental box or casing, a screw which passes upwardly through said extension, and through said cylinder, and on which is mounted a block which is provided with an arm which projects through said slot, and which is adapted to operate in connection with lugs or projections formed on said music-frames, a spring-drum mounted in said supplemental box or casing, and gearing connected with said drum, the extension of said cylinder, and adapted to be operated by spring-operated shafts mounted in the box or casing for turning said music-frames in either direction, substantially as shown and described.

601,645. RAIL-SUSTAINING BAR. WILLIAM GOLDIE, Wilkinsburg, Pa. Filed Apr. 17, 1897. Serial No. 632,586. (No model.)

Claim.—1. A narrow rigid rail-sustaining bar of length corresponding approximately to the width of the rail-base, and having a lateral upwardly-projecting shoulder at one end and lateral downwardly-projecting prongs at or near each end, substantially as set forth.

2. A narrow rigid rail-sustaining bar having lateral downwardly-projecting prongs at or near the ends, the upper portions of the prongs being the full width of the bar, substantially as set forth.

3. A narrow rigid rail-sustaining bar having an upwardly-projecting lateral shoulder at one end, and a downwardly-projecting prong directly under the shoulder, substantially as set forth.

4. In combination with a rail and tie, a rail-sustaining bar of length corresponding approximately to the width of the rail-base and having an upwardly-projecting shoulder at one end to sustain lateral strain, and downwardly-projecting prongs at each end, the upper portions of which are the full width of the bar, said bar being interposed transversely of the rail and being adapted to be pressed bodily into the tie, substantially as set forth.

601,646. RAIL-SUSTAINING BAR OR PLATE. WILLIAM GOLDIE, Wilkinsburg, Pa. Filed May 17, 1897. Serial No. 636,902. (No model.)

Claim.—1. A rail-sustaining bar or plate having prongs or flanges thereon extending beyond the end thereof and spread into flaring diagonal position so as to give lateral resistance between the same and the tie, substantially as set forth.

2. A rail-sustaining bar or plate having at the outer end thereof an upwardly-projecting shoulder, and beyond such outer end prongs or flanges extending diagonally to the body of the plate so as to give lateral resistance between the same and the tie, substantially as set forth.

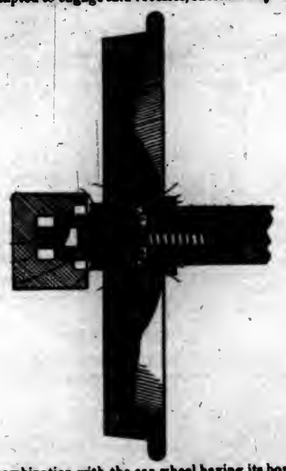
3. A rail-sustaining bar or plate having flanges extending longitudinally thereof and having the ends of the flanges extending diagonally to the main portions thereof, so as to give lateral resistance between the same and the tie, substantially as set forth.

4. A rail-sustaining bar or plate having flanges extending longitudinally thereof and having the ends of said flanges spread into flaring position diagonal to the main portions thereof so as to give lateral resistance between the same and the tie, substantially as set forth.

5. A rail-sustaining bar or plate having a shoulder at the outer end thereof and having flanges projecting forward into flaring or diagonal position, and ribs along the inner faces of the upper portions of said flanges, substantially as set forth.

6. A rail-sustaining bar or plate having a shoulder at the outer end thereof, and a strengthening-rib extending longitudinally along the bottom face thereof and upwardly on the outer face of said shoulder, substantially as set forth.

601,647. RAIL-SUSTAINING BAR OR PLATE. WILLIAM GOLDIE, Wilkinsburg, Pa. Filed Nov. 20, 1897. Serial No. 660,124. (No model.)



Claim.—A rail-sustaining plate or bar formed of a body portion having a flange extending below the same, the upper part of each flange being straight while the base thereof is formed of a series of diagonally-extending cutting edges joining each other and pressing-faces alternately tapering on the inside and outside of the plate and extending down to each diagonal cutting edge, substantially as set forth.

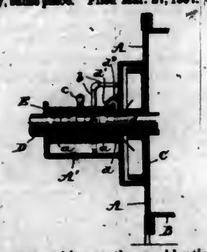
601,648. CAR WHEEL AND AXLE. JACOB A. GRAHAM and JOHN W. KILE, Deerfield, Va. Filed Mar. 30, 1896. Serial No. 585,295. (No model.)

Claim.—1. The combination with a car-wheel, its axle and axle-box, of means for holding the wheel fast upon the axle and means actuated by the axle-box for automatically allowing the same to turn loosely thereupon when rounding a curve, substantially as described.

2. The combination with the car-wheel having its bore provided

with diametrically-disposed recesses, of an axle having spring-actuated pawls adapted to engage said recesses, substantially as described.

3. The combination with the car-wheel having its bore provided with diametrically-disposed recesses, of an axle having spring-actuated pawls adapted to engage said recesses, and a spring within the bore of the axle, substantially as described.



4. The combination with the car-wheel having its bore provided with diametrically-disposed recesses, of an axle having spring-actuated pawls adapted to engage said recesses, and a spring within the bore of the axle, and an endwise-movable bolt adapted to actuate said pawls, substantially as described.

5. The combination with the car-wheel having its bore provided with diametrically-disposed recesses, of an axle having a longitudinal bore, a spring located therein, a spring-plate resting thereon and dogs pivotally mounted on said plate and projecting through recesses in the axle and engaging recesses in the bore of the wheel, substantially as described.

6. The combination with the car-wheel having its bore provided with diametrically-disposed recesses, of an axle having a longitudinal bore, a spring located therein, a spring-plate resting thereon and dogs pivotally mounted on said plate and projecting through recesses in the axle and engaging recesses in the bore of the wheel, and an endwise movable bolt adapted to be automatically forced into the bore of the axle as the car approaches a curve, substantially as described.

601,649. OILER FOR SHAFTS OF PRESSURE-BLOWERS.

THOMAS W. GREEN, Philadelphia, Pa., assignor to the Wilbraham Baker Blower Company, same place. Filed Mar. 27, 1897. Serial No. 629,470. (No model.)

Claim.—1. In a rotary blower, the combination of the journal-box E, provided with one or more of the oilways *a*, extending into the oil-reservoir A', and having therein the annular groove *d*, and vent-passage *d'*, with the pipe *b*, having suitable oil-inlet and extending from the oil-reservoir to the inside of the blower, substantially as shown.

2. In a rotary blower the combination of the journal-box E, provided with the oilways *a*, and oil-reservoir A', having suitable oil-inlet and annular groove *d*, registering with the vent-passage *d'*, having the lip or cover d^2, with a pipe *b*, extending from the oil-reservoir to the inside of the blower and provided with a valve b^2, located between the reservoir and the casing surrounding the blower, substantially as shown.

3. In a rotary blower the journal-box E, having therein the oil way or ways *a*, and the vent-passage *d'*, and the reservoir A', provided with a suitable inlet for the oil and connected with the inside of the blower, in combination with the shaft D, having therein an annular groove registering with the vent-passage in the journal-box, substantially as shown.

4. In a rotary blower, the combination of the impeller-shaft D, surrounded by an annular groove, with a journal-box provided with the vent-passage *d'*, having the overhanging lip or extension d^2, substantially as and for the purpose described.

5. In a rotary blower a vent for shafts, said vent consisting of an annular groove surrounding the shaft and a passage leading from said groove to the outside of the journal-box, said vent being located in said journal-box between the blower-head and the oil-carrying journal-bearings of the journal-box, as set forth and for the purpose specified.

6. In a pressure-blower, the combination of the journal-box E, the journal therein and a suitable bearing for said journal, an oil-reservoir formed on the under side of the journal-box, and the oil-passages *a*, *a*, extending from the reservoir up through the journal-box to the journal for the purpose of supplying oil to said journal, with the impeller or blower and pipes *b*, *b*, connecting the interior of the said blower with the oil-reservoir for the purpose of creating a pressure in said oil-reservoir to force the oil therefrom up through the passages *a*, *a*, onto the said journal, as set forth.

601,650. COLLAPSIBLE CRATE.

GEORGE H. GROVE, Hummelstown, Pa. Filed Oct. 8, 1897. Serial No. 654,831. (No model.)

Claim.—1. A collapsible crate consisting of a bottom, end pieces secured thereto, ends hinged to said pieces, a partition, sides hinged between the partition and end strips, and a top made in two subdivisions each composed of two sections hinged together and to the ends, substantially as shown and described.

2. A collapsible crate consisting of a bottom, end pieces attached thereto, a partition made in two sections, one stationary and the other movable, sides hinged between the end strips and partition, ends hinged to the end strips, a top consisting of the sections I, J, J' and J' hinged together and to the ends, a sliding pin adapted to pass through the inner rails of the top, and a staple projecting upward from the movable section of the partition and adapted to receive the pin in its passage, substantially as and for the purpose set forth.

3. In combination, a bottom, end strips secured thereto, a partition secured to the middle of the bottom, said partition consisting of a stationary section and a swinging section, sides hinged between the end strips and partition, ends hinged to the end strips, a top made in two subdivisions each of which is hinged to one of the ends, said subdivisions consisting of two sections hinged together, dowel-screws for holding the movable parts in proper relative position, dowel-screws for securing certain of the parts together either in their distended or folded positions, a staple projecting upward from the swinging section of the partition, a locking-pin adapted to pass through the inner rails of the top and the staple, and a clip to which said pin is secured, as specified.

601,651. PLUNGER BRAKE-HEAD.

EDWARD S. HALL, New York, N. Y. Filed Dec. 22, 1896. Serial No. 616,576. (No model.)

Claim.—1. A brake-head comprising a head-plate and a renewable shoe having embedded fastenings adapted for attaching it to the head-plate, said embedded fastenings of the shoe being nearer the wheel-tire than is the head-plate and presenting only rounded

surfaces to the tire thereby preventing injury thereto by the fastenings should the shoe be overworn or be torn away from the head-plate.

2. A brake-head comprising a head-plate and a renewable shoe having partially-embedded fastenings adapted at their projecting portions for attaching the shoe to the head-plate, the embedded portions of the fastenings being nearer the wheel-tire than is the head-plate and presenting only rounded surfaces to the tire thereby preventing injury to the tire by the fastenings should the shoe be overworn or be torn away from the head-plate.

3. A brake-head comprising a head-plate and a renewable shoe having embedded fastenings each provided with two end portions adapted for attaching the shoe to the head-plate, said embedded portions of the shoe being nearer the wheel-tire than is the head-plate and presenting only rounded surfaces to the tire thereby preventing injury thereto by the fastenings should the shoe be overworn or be torn away from the head plate.

4. A brake-head comprising a head-plate and a renewable shoe having partially-embedded fastenings adapted at their projecting end portions for attaching the shoe to the head-plate, said projecting portions of the fastenings being connected in pairs by the embedded portions and said embedded portions being nearer the wheel-tire than is the head-plate and presenting only rounded surfaces to the tire thereby preventing injury thereto by the fastenings should the shoe be overworn or be torn away from the head-plate.

5. A brake-head comprising a head-plate having two pairs of keyhole-slots and renewable friction shoe or shoes provided with partially-embedded fastenings, each fastening having a head at each of its projecting ends, the embedded portions of the fastenings being nearer the wheel-tire than is the head-plate and presenting only rounded surfaces to the tire thereby preventing injury thereto should the friction-shoes be overworn or be torn away; the projecting headed portions of each fastening being adapted to engage one pair of keyhole-slots in the head-plate and look outside the plate.

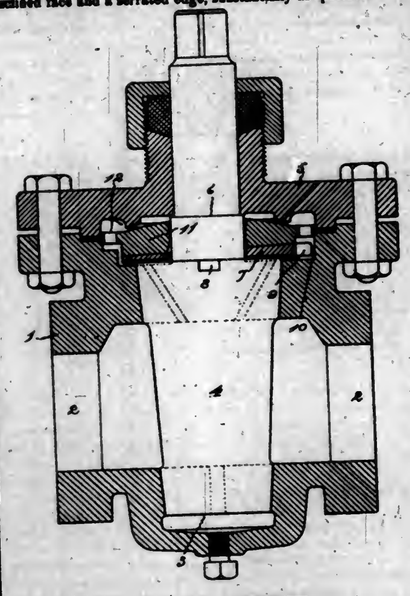
6. A brake-head comprising a head-plate having lugs or parts taking endwise thrust of a brake-shoe, and a renewable shoe having embedded fastenings adapted for attaching it to the head-plate, said embedded fastenings being nearer the wheel-tire than is the head-plate and presenting only rounded surfaces to the tire thereby preventing injury thereto by the fastenings should the shoe be overworn or be torn away; said embedded brake-shoe fastenings also being nearer the tire than are the end-thrust-receiving lugs of the head-plate thereby guarding the tire against puncture by the lugs.

7. A brake-head comprising a head-plate and a renewable brake-shoe having embedded fastenings adapted for attaching it to the head-plate, said embedded fastenings being nearer the wheel-tire than is the head-plate and presenting only rounded surfaces to the tire thereby preventing injury thereto by the fastenings should the shoe be overworn or be torn away; said head-plate having end-thrust-receiving lugs which are farther from the tire than are the brake-shoe fastenings and are prevented from injuring the tire by said fastenings; said head-plate also having side resistance-pieces taking lateral thrust of the brake-shoe.

601,652. ROTARY-PLUG COCK.

WILLIAM F. HARRISON, West Chester, Pa. Filed May 26, 1897. Serial No. 638,189. (No model.)

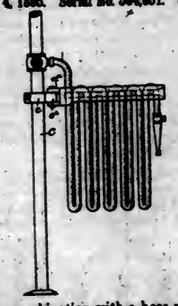
Claim.—1. A plug-cock having a body with a plug-chamber and ports, a plug located in the plug-chamber, a cap secured to the body over the plug-chamber, a stop-washer at the end of the plug and an adjustable wedge-disk located between the end of the plug and the inside of the cap, substantially as specified.



2. A plug-cock having a body with a plug-chamber and ports, a plug located in the plug-chamber, a cap secured to the body over the plug-chamber, and an adjustable wedge-disk located between the end of the plug and the inside of the cap, substantially as specified.

3. A plug-cock having a body with a plug-chamber and ports, a plug located in the plug-chamber, a cap secured to the body over the plug-chamber, a washer at the end of the plug, said washer having a part that is adapted to engage the walls of the body to determine the amount of rotary movement of the plug, and a wedge-disk between the washer and the inside of the cap, substantially as specified.

4. A plug-cock having a body with a plug-chamber and ports, a plug located in the plug-chamber, a cap secured to the body over the plug-chamber, a washer with an inclined face at the end of the plug, said washer having a part that is adapted to engage the walls of the body to determine the amount of rotary movement of the plug, and a wedge-disk between the washer and the inside of the cap, substantially as specified.



5. A plug-cock having a body with a plug-chamber and ports, a cap secured to the body over the plug-chamber, a stop-washer with lugs loosely projecting into sockets in the end of the plug and with an inclining face, and a wedge-disk with lugs loosely projecting into recesses in the walls of the body, located between the washer and the inside of the cap, substantially as specified.

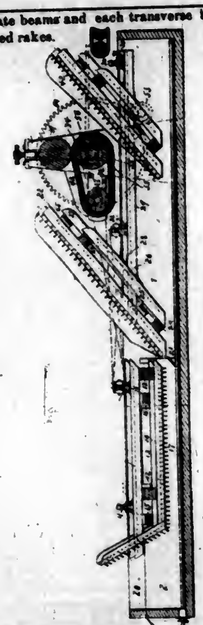
6. A plug-cock having a body with a plug-chamber and ports, a plug located in the plug-chamber, a cap secured to the body over the plug-chamber, and a wedge-disk with one globular face and one inclined face and a serrated edge, substantially as specified.

601,653. HOSE-RACK.

HENRY J. M. HOWARD, Washington, D. C. Filed Oct. 4, 1895. Serial No. 564,651. (No model.)

Claim.—1. The combination with a hose-rack, of hose-carrying pins arranged in horizontal alinement and adapted to slide in the direction of the length of the rack and to be entirely disconnected therefrom in the act of removing the hose, substantially as described.

2. A hose-rack comprising a support provided with longitudinal guides or ways, and hose-carrying pins arranged in horizontal alinement and adapted to move on or in the guides or ways and to be entirely disconnected therefrom in the act of removing the hose, substantially as described.



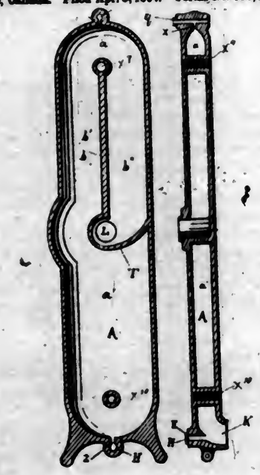
3. A hose-rack comprising a support provided with longitudinal guides or ways, hose-carrying pins arranged in horizontal alinement and adapted to move on or in the guides or ways and to be entirely disconnected therefrom in the act of removing the hose, and means for preventing the accidental escape of the pins from the rack, when the hose is hung thereon, substantially as described.

601,654. APPARATUS FOR TREATING TOBACCO.

ALPHEUS V. HYDER, Richmond, Va., assignor of two-thirds to S. P. Mays and W. J. Whitehurst, same place. Filed Jan. 16, 1897. Serial No. 619,440. (No model.)

Claim.—1. The combination with a vat, and rotary crank-shafts, of longitudinal bars connected with these cranks and operated thereby, inclined beams secured to the longitudinal bars, transverse bars

secured to alternate beams and each transverse bar provided with alternately-disposed rakes.



2. The combination with a vat, and means for conveying tobacco through the liquid in the vat, of a series of feeding-aprons onto which the tobacco is discharged, the said aprons being of different lengths, substantially as set forth.

3. The combination with a vat and means for conveying tobacco through the liquid in the vat, of a series of aprons for feeding the tobacco to the conveyer of a drying and ordering machine, and an evener for evening the tobacco after it has been deposited on the conveyer, substantially as set forth.

4. The combination with a vat and means for conveying tobacco through the liquid therein, rolls for expressing the excess of liquid from the tobacco, of feeding-aprons, means for taking the tobacco as it comes from the rolls and discharging it onto the feeding-aprons and an evener for evening up the tobacco discharged from the feeding-aprons, substantially as set forth.

601,655. RADIATOR. JOHN T JACKSON and FERGUS J. TRAVERS, Toronto, Canada. Filed Apr. 5, 1897. Serial No. 630,814. (No model.)

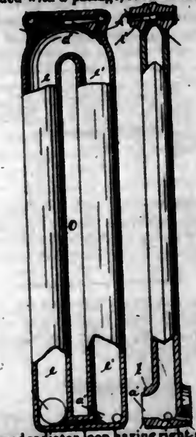
Claim.—1. The combination of a plurality of vertical radiator-sections each having transverse conduits at top and bottom for the escape of air and water of condensation, respectively, a steam-inlet opening and steam-outlet opening at its middle portion, and means for clamping the sections together, the several conduits and openings of the sections intercommunicating.

2. The combination of a plurality of vertical radiator-sections each having transverse conduits at top and bottom for the escape of air and water of condensation, respectively, a steam-inlet opening and a steam-outlet opening at its middle portion, and means for clamping the sections together, a deflecting-plate in each section separating the central inlet and outlet thereof, the several conduits and openings of the sections intercommunicating.

3. A vertical radiator, comprising a plurality of loops or sections each provided with top and bottom projections which fit together to form steam-tight joints, said projections having passages to allow the sections to communicate with each other, and with central fastening devices which serve to firmly secure the loops together at the center and to draw their top and bottom connections into close union.

4. An end loop of a radiator consisting of two chambers a, a', the lower chamber a' forming a single water-leg and provided with an inlet-opening, the upper chamber a divided by a vertical partition into two vertical water-legs b', b'', the vertical water-leg b' in communication with the lower chamber a', and the water-leg b'' in communication at the top of the loop with the water-leg b', the radiator-loop being provided with an outlet-port at the lower end of the water-leg b'', and a curvilinear horizontal partition connected to the lower end of the vertical partition separating the lower end of the water-leg b'' and outlet-port from the lower chamber a' and water-leg b', substantially as set forth.

5. An end loop of a radiator consisting of two chambers a a', the lower chamber a' forming a single water-leg and provided with an inlet-opening, the upper chamber a divided by a vertical partition into two vertical water-legs b', b'', the vertical water-leg b' in communication with the lower chamber a', and the water-leg b'' in communication at the top of the loop with the water-leg b', the radiator-loop being provided with an outlet-port at the lower end of the water-leg b'', and a curvilinear horizontal partition connected to the lower end of the vertical partition separating the lower end of the water-leg b'' and outlet-port from the lower chamber a' and water-leg b' and an exterior integral passage at the lower end of the said loop communicating therewith by a vertical opening, substantially as set forth.



6. An end loop of a radiator consisting of two chambers a, a', the lower chamber a' forming a single water-leg, the upper chamber a divided by a vertical partition into two vertical water-legs b', b'', the vertical water-leg b' in communication with the lower chamber a', and the water-leg b'' in communication at the top of the loop with the water-leg b', the radiator-loop being provided with an outlet-port located at the center of the loop and at the lower end of the water-leg b'', a curvilinear horizontal partition connected to the lower end of the vertical partition separating the lower end of the water-leg b'', and outlet-port from the lower chamber a' and water-leg b', a port at the lower end of the said loop: in combination with an intermediate loop, comprised of vertical water-legs in communication with each other, and separated by vertical partitions, an inlet and outlet for the water-legs separated by a curvilinear horizontal partition, drainage-openings at the bottom of the said loops in connection with each other and with the flow and return pipes, and air-vents at the top of the loops in communication with each other, substantially as set forth.

601,656. STEAM OR HOT-WATER RADIATOR. JOHN T. JACKSON and FERGUS J. TRAVERS, Toronto, Canada. Filed Apr. 12, 1897. Serial No. 631,706. (No model.)

Claim.—1. A radiator having loops coil-shaped the water-legs thereof being in circulation at the top only, said loops having a transverse passage at the top of the loop and two passages vertical to the said water-legs and connected with the transverse passage at the top of the loop, one of said vertical passages being located at one side of the loops and the other at the other side thereof, substantially as set forth.

2. A radiator having loops coil-shaped the water-legs thereof being in circulation at the top only, having a transverse passage, and two vertical passages, and two longitudinal passages at the two upper angles of the radiator-loops at opposite sides thereof, and at right angles to the vertical and transverse passages and the water-legs, whereby when the several loops of the radiator are brought together the two longitudinal passages form two continuous parallel passages from one end of the radiator to the other in circulation with the water-legs of the several loops thereof by means of the transverse and vertical passages therein, substantially as set forth.

3. The combination with the legs of the radiator-loop provided with transverse passages at their lower ends, of a brace connecting the legs and provided with a passage, substantially as set forth.

4. A coil-shaped radiator-loop having right-angle bends or elbows at the lower or feed and return ends of the water-legs with openings or passages joining with the right-angle bends at the opposite side of the said elbows from the outlet and inlet ports, said openings or passages when two loops are brought together registering to form one continuous passage between the loops for drainage purposes substantially as set forth.

5. A radiator-loop provided with vertical air-passages arranged at opposite sides of the upper end of the loop; a longitudinal passage communicating with and connecting said vertical passages, transverse air-passages arranged at right angles to the longitudinal passage and communicating with the latter; and transverse and horizontal drainage-passages at the lower end of the loop and communicating with the water-legs of said loop, substantially as shown and described.

6. A radiator comprising a plurality of loops each of which is provided at opposite sides of its upper end with two independent passages communicating with the water-legs of the loop; and at opposite sides of its lower end with two independent drainage-passages also in communication with the water-legs, substantially as shown and described.

601,657. HAT-FASTENER. OSCAR J. JOHNS and MILTON R. KERR, Winfield, Kans. Filed Feb. 8, 1897. Serial No. 622,563. (No model.)

Claim.—1. A hat-fastening comprising a casing provided with an opening and having the portion surrounding the opening pressed inward, forming a cavity and an inner projection, a slide provided with an opening corresponding with the opening of the casing and pressed outward between its edges, forming a space to clear the aforesaid inner projection, a pin movable transversely through the openings of the slide and casing and having its point enlarged to lie within the aforesaid cavity and prevent the outward displacement of the pin, and means for normally holding the openings of the casing and slide out of register, substantially as and for the purpose set forth.

2. A hat-fastening comprising a casing, a slide located in the casing, a pin operating through corresponding openings in the slide and casing, and a spring interposed between the casing and slide for normally holding the openings in the slide and casing out of register, substantially as and for the purpose set forth.

3. In a hat-fastening, a casing, a slide located in the casing, a spring consisting of a length of wire bent upon itself in a zigzag direction and interposed between the casing and slide, and a pin operating through corresponding openings in the slide and casing, substantially as set forth.

4. In a hat-fastening, a casing, a slide operating therein, a pin working through openings in the casing and slide, and a spring interposed between the casing and slide and consisting of a length of wire folded upon itself in opposite directions and having coils at the folds, substantially as shown for the purpose described.

5. In a hat-fastening, a casing having an opening near one end, and having a cavity surrounding the opening in the outer face of the casing, a slide operating in the casing and having an elongated opening and a centrally-depressed portion to provide clearance for the inwardly-depressed part of the casing forming the aforesaid cavity, a pin operating through the openings of the slide and casing and having its penetrating end enlarged, and a spring interposed between the casing and slide, as and for the purpose set forth.

6. In a hat-fastening, a plate having its opposite edge portions curved or bent to form guides, and having portions cut and bent outwardly, forming ears which are apertured, and having an end portion bent, a slide operating in the said guides, a spring interposed between the bent or closed end of the casing and the slide, and a pin operating through openings of the slide and casing, substantially in the manner and for the purpose specified.

601,658. BARREL-CLEANER. CHARLES KAESTNER, Chicago, Ill., assignor to Charles Kaestner & Co., same place. Original application filed June 1, 1897, Serial No. 638,979. Divided and this application filed Dec. 6, 1897. Serial No. 660,967. (No model.)

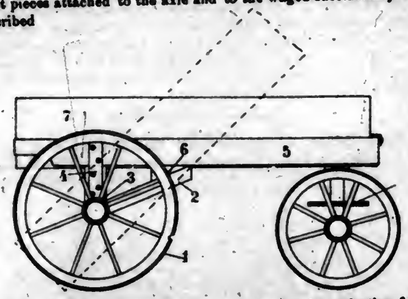
Claim.—1. A keg or barrel cleaner comprising a soaking-trough in and along which the kegs or barrels are soaked and moved, an overhead endless carrier elevated to clear the water within the trough and provided with projecting arms which engage and move the kegs or barrels along the trough and suitable supporting means for the overhead mechanism, substantially as described.

2. A keg or barrel cleaner comprising a soaking-trough in and along which the kegs or barrels are soaked and moved, an endless carrier provided with projecting arms which are hinged to the endless carrier and arranged for engaging the kegs or barrels and moving the same along the trough, and suitable supporting means for the overhead mechanism and link-braces hinge-connected with the endless carrier and said arms, substantially as described.

3. A keg or barrel cleaner comprising a soaking-trough in and along which the kegs or barrels are soaked and moved, an endless overhead carrier provided with projecting arms which successively engage and move the kegs or barrels from the receiving end to the delivery end of the trough and also carry such kegs or barrels up an incline at said delivery end of the trough and suitable supporting means for the overhead mechanism, substantially as described.

4. A keg or barrel cleaner comprising a soaking-trough in and along which the kegs or barrels are soaked and moved, overhead mechanism for moving the kegs or barrels along the trough consisting in a couple of elevated endless chains arranged upon sprockets provided with projecting hinged arms, and link-braces connected with the chains or link belts and said arms, the latter being arranged for engaging the kegs or barrels, and suitable supporting means for the overhead mechanism, substantially as described.

5. A keg or barrel cleaner comprising a soaking-trough in and along which the kegs or barrels are soaked and moved, overhead mechanism for moving the kegs or barrels along the trough comprising endless chains or link belts F arranged upon sprockets, arms e hinged to the chain or link belts; rods e^4 connecting the arms in pairs, and suitable supporting means for the overhead mechanism, and a track supporting the upper leaves of the chain or link belts against sagging, substantially as described.



6. A keg or barrel cleaner comprising a soaking-trough in and along which the kegs or barrels are soaked and moved; a track for supporting the kegs or barrels within the trough; and guides I having swinging supports and provided with arms which are adjustably connected with fixtures, substantially as described.

7. A keg or barrel cleaner comprising a trough in and along which the kegs or barrels are soaked and moved; standards K rising from the trough; an elevated endless carrier arranged upon sprockets which are supported by the said standards, and provided with projecting arms for engaging and moving the kegs or barrels, and a track arranged to uphold the upper leaf of the endless carrier, substantially as described.

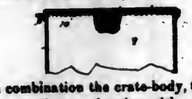
601,659. DUMPING-WAGON. GEORGE KAUTZ, Albany, N. Y. Filed Nov. 8, 1897. Serial No. 657,788. (No model.)

Claim.—1. A dumping-wagon having a rear crank-axle projecting forward of the rear wheels and under the wagon, the forward end of the crank-axle being attached to the wagon; the arms of the axle sloping downward and rearward and out of contact with the wagon and having stay-pieces between the axle and the wagon substantially as described.

2. A dumping-wagon having a rear crank-axle projecting forward of the rear wheels and under the wagon, the forward end of the crank-axle being movably attached to the wagon; the arms of axle sloping downward and out of contact with the wagon and upright pieces attached to the axle and to the wagon substantially as described

3. A dumping-wagon having a rear crank-axle projecting forward of the rear wheels and under the wagon the crank-axle having a cross bar or head extending across the wagon-bottom and means for pivoting the wagon-box to the crank-axle cross head or bar, the arms of the axle sloping downward and rearward and out of contact with the wagon and stay-pieces attached to the axle and to the wagon substantially as described.

601,660. EXPANSIBLE PULLEY. THEODOR KIRCHHOFF, Milwaukee, Wis. Filed Aug. 11, 1897. Serial No. 647,863. (No model.)



Claim.—1. An expansible pulley comprising a disk fast upon a hub or sleeve and provided with a series of equidistant radial grooves, a similar disk mounted loosely on the hub and provided with a registering series of grooves, and a series of sectors of the rim, each carrying an angular inward extension consisting of a web lying between the two disks, a cross web or ribs lying in opposite radial grooves, one side thereof being provided with a lug projecting through the groove of the movable disk, and a disk loosely mounted on the shaft and having a spiral groove in its inner face to engage said lugs, all arranged and combined substantially as set forth.

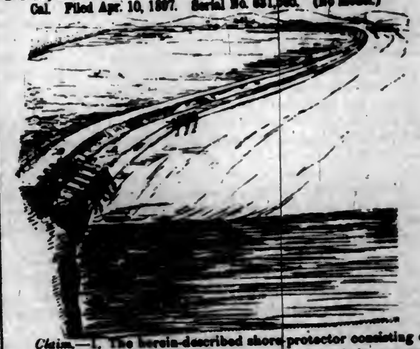
2. An expansible pulley, comprising a disk fast upon the hub, provided with a series of radial grooves in its inner face, a disk mounted loosely on the hub and having a corresponding series of grooves extending through it, a series of rim-sectors provided with ribs to enter said grooves and a lug to project through each groove of the movable disk, and an adjusting-disk lying against the movable disk and having a spiral groove in its inner face to receive said lugs, all arranged and combined substantially as set forth.

3. An expansible pulley, comprising a disk fast upon the hub, provided with a series of radial grooves in its inner face, a disk loosely mounted on the hub and having a corresponding series of grooves extending through it, a series of spacing-blocks on its inner face between said grooves, a series of rim-sectors provided with ribs to enter said grooves and a lug to project through each groove of the movable disk, and an adjusting-disk lying against the movable disk and having a spiral groove in its inner face to receive said lugs all arranged and combined substantially as described.

4. An expansible pulley, comprising a disk fast upon the hub, provided with a series of radial grooves in its inner face, a disk loosely mounted on the hub and having a corresponding series of grooves extending through it, a series of spacing-blocks on its inner face between said grooves, a series of rim-sectors provided with ribs to lie between the disks and fit snugly around said spacing-blocks, and ribs at right angles thereto to enter said grooves and a lug to project through each groove of the movable disk, and an adjusting-disk lying against the movable disk and having a spiral groove in its inner face to receive said lugs, all arranged and combined substantially as described.

601,661. METAL DOG-CASE. HENRY H. KNIGHT, Janelew, W. Va. Filed June 10, 1897. Serial No. 640,307. (No model.)

Claim.—In combination the crate-body, the top overlapping the same and having openings registering with openings in the body, a partition having a groove in its edge and the rod passing through the openings and the groove, substantially as described.



601,662. SOAP-HOLDER FOR TUBS. ENOCH H. LOSSELL, Mecosta, Mich., assignor of two-thirds to H. R. Walker and Robert C. Smith, Ionia, Mich. Filed Apr. 30, 1896. Renewed Sept. 22, 1897. Serial No. 652,640. (No model.)

Claim.—1. A soap-holder attachment comprising a U-shaped frame the sides of which are provided with inclined grooves and having a cut-out portion near the upper and thereof, inwardly-extending lugs formed integral with said sides and provided with curved ends, supports also formed integral with said sides and opposite to the cut-out portion, a removable shelf sliding in the inclined grooves and provided with flanges adapted to retain the soap on the shelf, one of said flanges being adapted to engage with the curved ends of the inwardly-projecting lugs to retain the shelf upon said supports, said shelf also having a locking-notch, and a spring secured to the lower side of the frame and adapted to engage with the locking-notch, substantially as set forth.

2. A soap-holder attachment comprising a U-shaped frame, the sides of which are provided with inclined grooves and having a cut-out portion near the upper end thereof, inwardly-extending lugs formed integral with said sides and provided with curved ends, supports also formed integral with said sides and opposite to the cut-out portion, a removable shelf having its ends beveled and sliding in the inclined grooves, said shelf also having flanges projecting from one of its faces and adapted to retain the soap thereon, one of said flanges being provided at its ends with extensions adapted to engage with the curved ends of the inwardly-extending lugs to retain the shelf upon said supports, said shelf being further provided with a drain-spout and also having a locking-notch, and a spring secured to the U-shaped frame and adapted to engage with said locking-notch to retain the shelf in said frame, substantially as set forth.

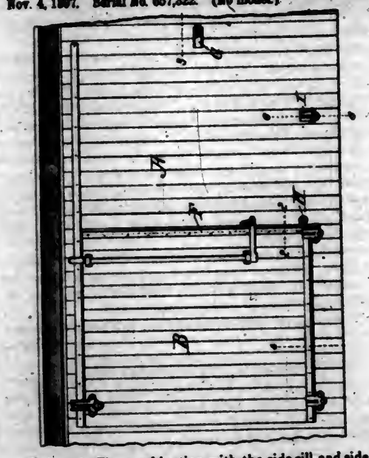
601,663. SHORE-PROTECTOR. THOMAS B. LOVBAL, Sacramento, Cal. Filed Apr. 10, 1897. Serial No. 631,565. (No model.)

Claim.—1. The herein-described shore-protector consisting of a frame having the brushes located thereon, said frame being composed of a series of standards or timbers connected together by wire bands or the like, the lower ends of said timbers being provided with the pointed ends, in combination with a skid or way having the rollers mounted thereon, for the purpose described.

2. A mattress for the purpose described comprising the framework having the bands or wire rods surrounding the same and adapted to secure the several parts in position, the brushes located within said framework, said framework being provided with the lower pointed ends, and an upwardly-extended bar from the rear portion thereof adapted to be secured to the upper surface of the embankment or shore, substantially as shown and described.

3. The mattress for protecting levees or banks, consisting of parallel poles having pointed lower ends adapted to sink into the river-bottom at the bottom of the bank or levee, the layer of bunches of brush upon said poles, the parallel shorter poles laid upon said layer of brush, and the bands connecting the parallel poles and bending them tightly upon the brush, substantially as described.

4. A shore-protector comprising a way or skid having the rollers mounted thereon as shown, in combination with a mattress, the same consisting of two sections suitably secured together, one of said sections being provided with the downwardly extended pointed end and a connection secured to the portion carrying said end, the same being adapted to be attached to a stake on the surface of the ground and then to the upper extended end of the portion of the mattress carrying the pointed end, substantially as and for the purpose set forth.



601,664. PRESSURE-ACTUATED GOVERNOR FOR PUMPS. JAMES H. MACDONALD, Athol, Mass. Filed June 10, 1897. Serial No. 640,306. (No model.)

Claim.—1. Automatic valve-adjusting mechanism including a diaphragm-chamber, a diaphragm connected with a valve to be actuated and exposed at opposite sides to the pressure, respectively, of a fluid motive agent and a fluid acted upon by compressive force, the pressure of the second-named fluid being conveyed to the diaphragm-chamber by a casing disposed perpendicularly with relation to the plane of the diaphragm, a coiled spring attached at one end to an object fixed to and carried by the diaphragm, a feed-nut attached to the opposite end of said spring, and an axially-immovable feed-screw swiveled in the casing in an axial position, threaded in said feed-nut, and provided with exposed means whereby it may be turned to adjust the feed-nut to vary the tension of said spring, substantially as specified.

2. The combination with a controlling-valve provided with a plurality of ports for controlling a corresponding number of feed-ports, said valve having a stem, a diaphragm-chamber having a peripherally-secured diaphragm centrally attached to the valve-stem, means for adjusting the valve with relation to its stem and in a direction parallel therewith, said diaphragm being exposed at one side to the pressure of fluid motive agent which is adapted to be controlled in its passage through the feed-ports by said valve, a casing communicating with the diaphragm-chamber at the opposite side of the diaphragm and exposed to fluid subjected to a compressive force, a spring arranged in said casing and attached to an object carried by the diaphragm and adapted to exert a pressure in opposition to that of said motive agent, a feed-nut fixed to the opposite end of the spring, and a feed-screw swiveled in the casing and engaging the feed-nut, whereby when the feed-screw is rotated the feed-nut is moved axially to vary the tension of the spring, the feed-screw being provided with a collar or enlargement fitted in a seat in the casing and held in place by means of a removable plug substantially as specified.

601,665. CAR-DOOR. EDWARD S. MARSHALL, St. Louis, Mo., assignor to the Missouri Railway Equipment Company, same place. Filed Nov. 4, 1897. Serial No. 657,222. (No model.)

Claim.—1. The combination with the side sill and side wall of a car, of the decking or flooring which is cut short of the outer edge of the side sill, and an angle-iron for sealing the exposed cracks or joints; substantially as described.

2. The combination with the side wall A of a car, the door B, side sill C, decking D, and an angle-iron E; substantially as described.

3. The herein-described stop-casting adapted to be attached to the side wall of a car, the same consisting of a body portion G formed with a recess *g* in its front side and a gooseneck extension *g'*; substantially as described.

4. The combination with the side wall A of a car, the door B, having a sealing-strip F on its rear outer end, and a back-stop G formed with a recess *g* for receiving the projecting edge of strip F, and an extension *g'* for extending over the door to prevent the same from swinging out; substantially as described.

5. The combination with the side wall of a car, of a sliding door, and a rubbing knob or projection formed with a convexed face, which knob is secured to the side wall of the car adjacent to the lower rear edge of the door-opening, for throwing the door away from the side wall of the car; substantially as described.

6. The combination with the side wall of a car, of a sliding door suspended by suitable hangers, a knob or projection H secured to the side wall of the car adjacent to the lower rear edge of the door-opening, said knob being formed with a convexed outer face and cooperating with the battes on the lower inner edge of the door for throwing said door, in its opening and closing movement, away from the side wall of the car, so that said door will not bind, should the side wall of the car be bulged; substantially as described.

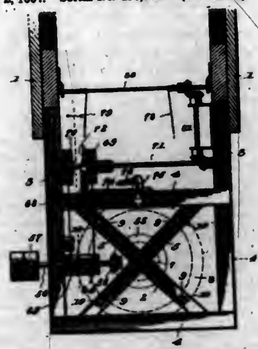
7. The combination with the side wall of a car, of a sliding door, a rubbing knob or projection for holding the door away from the side wall of the car, and a guide-bracket for securing said rubbing-knob to the side wall of the car; substantially as described.

8. The combination with the guide-bracket I formed with a groove *i* and a pocket *i'* in its inner face, of a rubbing-knob J, and a headed shank *j j'*, extending from said knob and cooperating with the groove and pocket in the guide-bracket; substantially as described.

601,666. SAFETY-PIN. WILLIS B. MICHAEL, Enterprise, W. Va. Filed July 20, 1897. Serial No. 646,206. (No model.)

Claim.—1. A safety-pin formed from a single piece of wire, and comprising a body portion, a pin proper, a keeper, a spring-actuated arm having a lateral projection normally lying across the pin to hold the latter in its keeper, said projection being movable vertically and laterally out of the path of travel of the pin, substantially as described.

2. A wire safety-pin, comprising a body portion and a pin proper, a keeper formed at the forward end of the body portion, a coil located above said keeper, rearwardly-extending arms leading from said coil, one of said arms being bent at its forward end to form a stop having



a downwardly and outwardly inclined portion and a horizontally-disposed portion extending across above the pin to hold it in its keeper, said stop being movable vertically with the arms and laterally by the engagement of the pin with the inclined portion of the stop, substantially as described.

3. A wire safety-pin, comprising a body portion and a pin proper, a keeper formed at the forward end of the body portion, a coil located above said keeper, rearwardly-extending arms leading from said coil and lying on opposite sides of the body portion, one of said arms being bent at its forward end to form a stop having a downwardly and outwardly inclined portion, and a horizontally disposed portion extending across above the pin to hold it in its keeper, and then being bent to form a spring-loop to straddle the other arm and the body portion, said stop being movable vertically with the arms against the spring action of the coil and laterally against the spring action of the loop by the engagement of the pin with the inclined portion of the stop, substantially as described.

4. A wire safety-pin, comprising a body portion and a pin proper, a keeper formed at the forward end of said body portion, a coil located above said keeper, rearwardly-extending arms leading from said coil, and a stop at the forward end of one of said arms.

5. A wire safety-pin, comprising a body portion and a pin proper, a keeper formed at the forward end of said body portion, a coil located above said keeper, rearwardly-extending arms leading from said coil, located one on each side of the strand constituting the main portion of the body part, and having a flange constituting a finger-engaging portion, one of the said arms being bent at an angle at its forward end, forming a stop, the spring-pressure exerted by said coil serving to hold said arms in their normal position.

601,667. STRAW-STACKER. ROBERT MOY, Modena, Wis. Filed Sept. 2, 1897. Serial No. 650,365. (No model.)

Claim.—1. In a straw-stacker, the combination with a swinging frame, and a power-shaft, of an actuating-shaft, an intermediate shaft between the power and actuating shafts, clutch mechanism and connections between said power and intermediate shafts to drive the latter shaft in reverse directions alternately from the power-shaft, a yieldable trip operatively connected with said clutch, detents on the swinging frame to contact alternately with said yieldable trip, and connections between the actuating-shaft, the intermediate shaft and the swinging frame, substantially as described.

2. In a straw-stacker, the combination with a base-frame, a swinging frame pivoted on a fixed king-bolt or arbor and carrying a conveyer driving-shaft, and a double master-gear mounted loosely on said arbor and operatively connected with the conveyer driving-shaft, of a power-shaft geared to said master-gear and provided with two pulleys, an intermediate shaft having loose pulleys operatively connected by belts with said pulleys of the power-shaft, a clutch between the loose pulleys of the intermediate shaft, a spring-controlled trip mounted in the path of the swinging frame, means connecting said clutch and trip, and an actuating-shaft operatively connected with the intermediate shaft and said swinging frame, substantially as described.

3. The combination with a swinging stacker-carrying frame, and a supporting-frame, of an actuating shaft, cables coiled reversely on the actuating-shaft and attached to the swinging frame, a power-shaft, an intermediate shaft geared to the actuating-shaft, the pulleys mounted on the intermediate shaft, belts fitted to said power-shaft and the pulleys to drive the latter in opposite directions, a clutch mechanism to make the pulleys fast with the intermediate shaft alternately, and a trip mechanism actuated by the swinging frame to control the clutch mechanism, substantially as described.

4. The combination with a swinging stacker-carrying frame, a power-shaft, and an actuating-shaft connected with said frame, of an intermediate shaft, the pulleys mounted on said intermediate shaft, the straight and crossed belts between the power-shaft and said pulleys, the clutch between said pulleys, the spring-trip connected with said clutch, and the spaced detents carried by the swinging frame and arranged to alternately strike the trip, substantially as described.

5. The combination with a swinging stacker-carrying frame, and a power-shaft, of an actuating-shaft, cables attached to the swinging frame and coiled in reverse directions on the actuating-shaft, an intermediate shaft geared to the actuating-shaft, pulleys mounted loosely on the intermediate shaft and geared to the power-shaft to be driven thereby in opposite directions, a slidable clutch between said pulleys, a shipper-rod, a trip connected to the shipper-rod, and detents carried by the swinging frame and arranged to alternately strike the trip, as and for the purposes described.

6. The combination with a main supporting-frame, a swinging stacker-carrying frame pivotally attached to the supporting-frame, and a stacker-conveyer driven by a shaft, 13, on said stacker-frame, of a power-shaft, a counter-shaft geared to the shaft, 13, a master-gear loose on the pivotal connection of the swinging frame and geared with the power-shaft and the shaft 13, an actuating-shaft having flexible connections with the swinging frame, an intermediate shaft geared to the actuating-shaft, a shifting mechanism including a clutch and operatively connecting the intermediate shaft with the power-shaft, and a trip-controlled tripper actuated by the swinging frame and connected with the clutch, for the purposes described substantially as set forth.

7. The combination with a swinging frame, and a sectional foldable stacker mounted thereon, of a stacker-adjusting shaft having cables which are branched and attached to the sections of the stacker-frame, a guide-bail through which the stacker-cables are passed, an adjusting-shaft having a flexible cable connected with the guide-bail, and an adjusting-shaft carried by one section of the stacker-frame and having cables connected with the other section of said stacker-frame, as and for the purposes described.

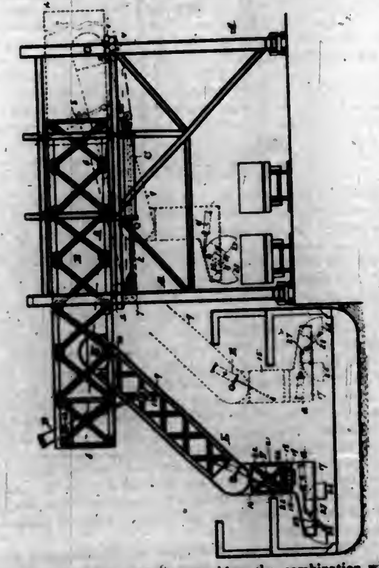
601,668. PROCESS OF POLISHING MARBLE. JOHN M. MUELLER, Jr., Cincinnati, Ohio. Filed Aug. 10, 1895. Serial No. 558,930. (No specimens.)

Claim.—1. The improvement in the art of polishing marble which consists in subjecting the stone simultaneously to the action of oil and a rapidly-moving tool, substantially as and for the purpose set forth.

2. The improvement in the art of polishing marble which consists in subjecting the stone to the simultaneous action of oil, a fine abradant and a rapidly-moving tool, substantially as and for the purpose set forth.

3. The improvement in the art of polishing stone and marble consisting, as a final step, in subjecting the material under treatment to the action of a fine abradant in the presence of oxalic acid and an oil or fat, applied by a tool moving so rapidly as to prevent absorption by the material under treatment of the oil or fat employed, substantially as described.

601,669. GARMENT-HOOK. WILLIAM P. MCILVAR, Cambridge, Ohio. Filed Apr. 30, 1897. Serial No. 634,591. (No model.)



Claim.—1. A supporting-hook and lock therefor, comprising a projection to which is attached or formed integral an arm that is curved downwardly and upwardly terminating in a head on a line with a vertical opening in the projection, a presser-bar located within the opening and having notches, and a lock carried by the projection so that the bolt thereof will engage the notches of the presser bar, substantially as shown and for the purpose set forth.

2. In a supporting-hook and locking device therefor, the combination with a projection carrying an arm which is curved downwardly and inwardly terminating in a head, the projection having a vertical opening, a presser-bar movable within the vertical opening of the projection and having a foot which engages the head of the hook, a spring for normally raising the presser-bar, and a lock carried by the projection so that the bolt thereof will engage the notches in the presser-bar, substantially as shown and for the purpose set forth.

3. In a supporting-hook and lock therefor, the combination with a wall-plate having means for attaching the same in place, a projection extending from the wall-plate and carrying an arm which is curved downwardly and inwardly terminating in a head, a presser-bar located within a vertical opening in the projection and having a foot adapted to engage the head of the hook, said presser-bar having notches therein, a helical spring encircling the presser-bar and interposed between the head thereon and the projection by which the presser-bar is supported, together with a lock supported by said projection and having a bolt which engages notches in the presser-bar, substantially as shown and for the purpose set forth.

601,670. LOADING OR UNLOADING APPARATUS. JOHN MCMYLER and GEORGE H. HULETT, Cleveland, Ohio. Filed Jan. 30, 1897. Serial No. 621,203. (No model.)

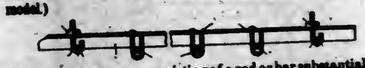
Claim.—1. In an unloading-machine, the combination with a frame, and a beam extending out laterally therefrom, of a leg depending from the beam and a scoop or bucket supported on the lower end of the leg and capable of being turned completely around relative to the beam which carries it.

2. In an unloading-machine, the combination with a frame, and a beam supported thereon and adapted to be shifted endwise, of a lifting-arm pivoted to this beam, a depending leg pivotally attached to the arm, a foot having a rotary connection with the leg, a scoop or bucket connected with the foot and means for operating and controlling each of these parts.

3. The combination with a leg adapted to be extended down into the hold of a vessel, of a scoop or bucket connected with the lower end of the leg, said scoop or bucket extended laterally to one side of the axial center of the leg and capable of being turned around horizontally through a complete circle.

4. The combination with a depending leg, and means for raising it from and lowering it into the hold of a vessel, of a scoop or bucket connected with the lower end of the leg and located at one side of the axial center of the leg.

5. The combination with a depending leg and means for shifting it laterally and moving it up and down, of a scoop or bucket connected with the lower end of the leg at one side of the axial center of the leg.



6. The combination with a depending leg, of a revolvable foot having rollers on its upper end which travel on a circular track on the lower end of the leg, and means for rotating this section, substantially as set forth.

7. The combination with a depending leg, of a revolvable foot depending from the lower end of the leg, one part having a circular track and the other rollers connected therewith which turn on the track, drums connected with the foot, cables extending around the drums in opposite directions, and means for moving these cables to turn the section.

8. In an unloading-machine, the combination with the frame, and an endwise-movable beam supported thereon, of a hydraulic ram the piston-rod of which extends out at both ends of the cylinder and a cable extending from each end of the piston to an end of the beam whereby to shift the latter endwise.

9. In an unloading-machine, the combination with a frame, a beam having sliding connections therewith, a tilting arm pivoted to the beam, a leg pivoted to the arm, a laterally-extending foot having a rotary connection with the leg and a scoop or bucket connected with the foot, of hydraulic rams for operating each of these several parts.

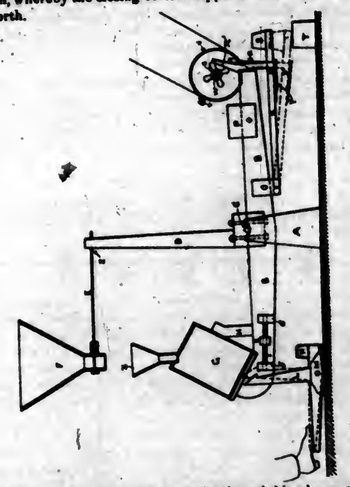
601,671. WIRE-FENCE STAY. MICHAEL NEIL and FRANK H. RUSSELL, Dayton, Ohio. Filed Aug. 2, 1897. Serial No. 646,768. (No model.)

Claim.—A fence-stay, consisting of a rod or bar substantially semi-tubular or V shape in cross-section, two screw-hooks, each adapted to be adjusted in the upper and lower ends of the bar, said hooks adapted to engage the top and bottom fence-wires and to kink them into the concavity of the bar, and a series of intermediate loops rigidly secured to the bar, each loop consisting of a headed wire passed through perforations in the stay and having their free ends bent into elongated loops extending into the concave surface of the bar, and beyond the edges thereof, with the free ends resting rigidly against the bar, said intermediate loops being thereby rigidly held within the concavity of the bar and adapted to receive and support the intermediate fence wires and to permit the same to move longitudinally and horizontally, substantially as and for the purposes described.

601,672. WRENCH. JOHN G. NEWELL, New Haven, Conn., assignor of one-half to Levi T. Snow, same place. Filed July 22, 1897. Serial No. 645,901. (No model.)

Claim.—The combination with the slotted yoke 4, provided with the web 17, the handle 1 provided with the leaf-spring 18 and the pin 2 on which it is fulcrumed in said slotted yoke, and the movable jaw 9, longitudinally adjustable in said yoke, and provided with a series of teeth 11, adapted to engage the corresponding teeth 7, on the handle 1, substantially as shown and described.

601,673. PROCESS OF MORDANTING. FRANCIS J. OAKES, New York, N. Y. Filed June 11, 1897. Serial No. 640,365. (No specimens.)



Claim.—The process of mordanting a fiber or fabric consisting in first subjecting it to a solution of tannic acid, and afterward subjecting it to a bichromate or chromic-acid bath, thus fitting it for dyeing with any desired color, substantially as specified.

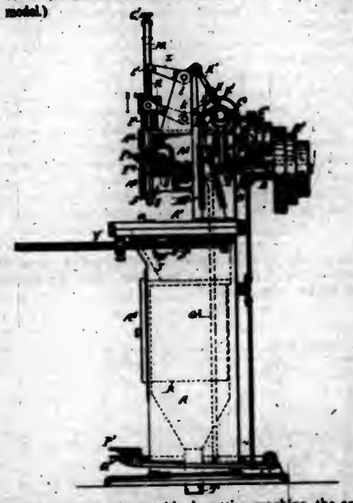
601,674. WEIGHING APPARATUS. FRANKLIN W. OLIN, Alton, Ill. Filed Mar. 6, 1896. Serial No. 581,940. (No model.)

Claim.—1. In a weighing apparatus, a suitable pivoted weighing-beam, adapted to retain a weighing can or receptacle at the end of one arm thereof, a weight carried by the opposite arm indicating the number of pounds to be weighed, means operating in connection with the end carrying the receptacle for normally retaining the beam stationary against the gravitating action of the weight and subsequently releasing said beam and allowing the weighted arm to immediately or suddenly tilt downward, a suitable source of supply for the material to be weighed, and intermediate connections between the source of supply and the beam for controlling the delivery of the material to be weighed from the source of supply, substantially as set forth.

2. In a weighing apparatus, a suitable pivoted weighing-beam, a can at the free end of one arm thereof, a weight indicative of the number of pounds carried by the opposite arm, means operating in

connection with the end carrying the receptacle for normally retaining the beam stationary against the gravitating action of the weighted arm and subsequently releasing the beam and allowing the weighted arm to immediately tilt downward, a suitable hopper, intermediate connections between the hopper and beam for opening the hopper with the sudden tilting of the beam in one direction, suitable means independent of the weighing apparatus for suddenly lightening the weighted arm of the beam and cause the beam to tilt in the opposite direction, whereby the closing of the hopper is effected, substantially as set forth.

3. In a weighing apparatus, a suitable weighing-beam adapted to retain a weighing-receptacle at the end of one arm thereof, and having a weighted arm carrying an adjustable or shifting weight adapted to be set for weighing a predetermined quantity of material and adapted to tilt the beam in one direction, an independent actuating device in connection with the weighted arm for reducing the weight of the arm to less than the weight of the arm carrying the receptacle whereby the beam will tilt in the opposite direction, means operating in connection with the arm carrying the receptacle for normally retaining the beam stationary against the gravitating action of the weight, and subsequently releasing said beam and allowing the weighted arm to tilt downward, and a suitable source of supply for the material to be weighed controlled by the beam, substantially as set forth.



4. In a weighing apparatus, a suitable pivoted beam, adapted to carry a can or other receptacle at the end of one arm thereof, a balance-adjusting device carried by said arm, a weight carried by the opposite arm indicative of the number of pounds to be weighed, a bar pivoted to the weighted arm, a trigger pivoted at the free end of the bar and adapted to engage the free end of the weighted arm, a spring-plate controlling said trigger, a weight carried at the free end of the bar pivoted to the weighted arm of the beam, a series of arms driven by an independent source of power and adapted to impinge against the trigger and release the same from the weighted arm of the beam, a releasing foot-lever for normally holding the beam in a horizontal position, a suitable hopper, a closing-plate for the mouth of the hopper, an arm carried by the beam and adapted to swing with the tilting of the latter, the free end of the arm controlling the movements of the closing-plate, the parts operating as and for the purpose set forth.

5. In a weighing apparatus, a suitable beam, a weighted arm for the same, a weighted bar pivoted to said arm, a spring-controlled trigger pivoted along said bar and adapted to engage with the free end of the weighted arm, an extension for said trigger having an inclined surface, a series of revolving arms driven from an independent source of power adapted to impinge against the inclined surface of the trigger extension, and suitable means for controlling the beam from the opposite arm thereof, substantially as set forth.

6. In a weighing apparatus, a suitable beam having a weighted arm, a weighted bar pivoted to said arm, a spring-controlled trigger pivoted along said bar and adapted to engage with the free end of the weighted arm, and an actuating device for tripping the trigger and releasing the bar from the weighted arm, substantially as set forth.

7. In a weighing apparatus, a suitable beam having a weighted arm, a weighted bar pivoted to said arm, a trigger pivoted along said bar and adapted to engage with the free end of the weighted arm, and an actuating device for tripping the trigger and releasing the bar from the weighted arm, substantially as set forth.

601,675. BUTTON-BLANK-CUTTING MACHINE. WILLIAM A. PENDRY, Detroit, Mich. Filed Apr. 5, 1897. Serial No. 630,787. (No model.)

Claim.—1. In a button-blank-cutting machine, the combination of a supporting-frame, a rotatable mandrel sleeved through a portion of said frame, a plunger within the mandrel and carried thereby, means to simultaneously reciprocate the mandrel and plunger, a saw carried by the plunger within said mandrel, a push-bar within the plunger, and means to reciprocate the push-bar, said mandrel projecting downward about the saw toward its lower end and provided at its lower end with a chuck to engage about the saw, the means to reciprocate the mandrel and plunger, and the means to reciprocate the push-bar acting in successive order, for the purpose set forth.

2. In a button-blank-cutting machine, the combination of a rotatable mandrel, a plunger within the mandrel and carried thereby, a saw carried by the plunger within said mandrel, a push-bar within the plunger, a rotatable shaft, a bell-crank actuated from said shaft to simultaneously reciprocate the mandrel and the plunger, and an additional bell-crank actuated by said shaft to reciprocate the push-bar, said mandrel projecting downward about the saw toward its lower end and provided at its lower end with a chuck to engage about the saw, the bell-crank to reciprocate the mandrel and plunger, and the bell-crank to reciprocate the push-bar acting in successive order, for the purpose set forth.

3. In a button-blank-cutting machine, the combination of a rotatable mandrel, a plunger within the mandrel, a push-bar within the plunger, a rotatable shaft, cams mounted upon said shaft, bell-cranks connected the one with the mandrel and the other with the push-bar, said bell-cranks actuated by the corresponding cams upon said shaft, and means to throw said cams out of operation with said bell cranks, substantially as described.

4. In a button blank-cutting machine, the combination of a supporting-frame, a plunger, a tubular saw carried by the plunger, a rotatable mandrel sleeved through a portion of said frame carrying said plunger therewithin and projecting downward about the saw at its lower end, a chuck carried by the mandrel located about the lower end of the saw to engage and hold the saw, a plug within the saw to prevent too great tension of the chuck upon the saw, a push-bar reciprocatory through said plug, and means to simultaneously reciprocate the mandrel and plunger, substantially as set forth.

5. In a button-blank-cutting machine, the combination of a supporting-frame, a mandrel sleeved through a portion of said frame, a plunger carried by the mandrel therewithin, a cutter carried by the plunger within the mandrel, a driving-shaft geared with the mandrel to simultaneously rotate the mandrel and plunger, a push-bar within the plunger, means to simultaneously reciprocate the mandrel and plunger, and means to reciprocate the push-bar, said mandrel projecting downward about the saw toward its lower end and provided at its lower end with a chuck to engage about the saw, said mandrel and plunger and said push-bar made reciprocatory in successive order, substantially as set forth.

6. In a button-blank-cutting machine, the combination of a mandrel, a plunger projecting into the upper end of the mandrel and carried by the mandrel therewithin, means to simultaneously rotate the mandrel and plunger, a tubular saw engaged with the lower end of the plunger and projecting through the lower end of the mandrel, a push-bar within the plunger and saw, and automatic mechanism to simultaneously feed and to retract the mandrel and plunger, and automatic mechanism to reciprocate the push-bar, said mandrel and plunger and said push-bar reciprocated in successive order, substantially as described.

7. In a button-blank-cutting machine, the combination of a mandrel, a plunger carried by the mandrel therewithin, a cutter carried by the plunger, means to rotate the mandrel and plunger, a push-bar within the spindle, a feed-shaft provided with a worm, a shaft C^4 provided with a worm-gear meshing with a worm on the feed-shaft, cams upon the shaft C^4, a bell-crank actuated by one of said cams to simultaneously reciprocate said mandrel and plunger, an additional bell-crank actuated by the other of said cams to reciprocate the push-bar, and means to throw the cams out of operation, substantially as set forth.

8. In a button-blank-cutting machine, the combination of a mandrel, a plunger carried by the mandrel therewithin, means to rotate the mandrel and plunger, a saw carried by the plunger, a push-bar within the mandrel, a feed-shaft, a shaft C^4 provided with cams and geared with the feed-shaft, a bell-crank actuated by one of said cams to simultaneously feed the mandrel and plunger, an additional bell-crank actuated by the other of said cams to reciprocate the push-bar, and means to throw said cams out of operation, substantially as described.

9. In a button-blank-cutting machine, the combination of a mandrel, a plunger carried by the mandrel therewithin, a cutter carried by said plunger, means to rotate the mandrel and plunger, a push-bar within the plunger, a feed-shaft provided with a worm, a shaft C^4 geared with said worm and provided with cams, a bell-crank actuated by one of said cams to simultaneously feed the mandrel and plunger, and a bell-crank actuated by the other of said cams to reciprocate the push-bar, said bell-cranks provided with wipers riding upon said cams, and means to throw said cams out of operation, substantially as described.

10. In a button-blank-cutting machine, the combination of a mandrel, a plunger carried by the mandrel therewithin, a saw carried by the plunger, a push-bar within the plunger, means to rotate the mandrel and plunger, driving devices to successively feed the cutter and the push-bar to the work, and means to longitudinally adjust and hold the plunger within the mandrel to adjust the saw to the work, said mandrel projecting downward about the saw toward its lower end and provided at its lower end with a chuck to engage about the saw, substantially as set forth.

11. In a button-blank-cutting machine, the combination of a rotatable mandrel, a plunger carried by the mandrel therewithin, a tubular saw carried by the plunger, a push-bar within the plunger, a yoke engaging the upper end of the push-bar, a driving device to simultaneously feed the mandrel and plunger, and a device to reciprocate the push-bar, said mandrel projecting downward about the saw toward its lower end and provided at its lower end with a chuck to engage about the saw, substantially as described.

12. In a button-blank cutting machine, the combination of a rotatable mandrel, a cutter, a push-bar, a rotatable shaft C^4 provided with cams mounted thereupon, bell-cranks actuated by said cams to feed the cutter and the push-bar to the work, and means to reciprocate said shaft to carry the cams out of operation with said bell-cranks and to retract the same, substantially as described.

13. In a button-blank-cutting machine, the combination of a mandrel, a cutter, a push-bar, a rotatable shaft provided with cams mounted thereupon, bell-cranks actuated by said cams to feed the cutter and the push-bar to the work, a bell-crank and foot-lever connected with said shaft to force the cams out of operation with the bell-cranks, substantially as described.

14 In a button-blank-cutting machine, the combination of a mandrel, a plunger carried by the mandrel therewithin, a cutter carried by the plunger, a push-bar within the plunger, a feed-shaft, a shaft C^4 geared with the feed-shaft, cams upon the shaft C^4, a clutch to throw the feed-shaft into and out of operation, a bell-crank actuated by one of said cams to simultaneously reciprocate the mandrel and plunger, an additional bell-crank actuated by the other of said cams to reciprocate the push-bar, said mandrel and plunger and said push-bar being reciprocated in successive order, substantially as set forth.

15. The combination with a button-blank-cutting machine, of a support, a removable open-work basket having an air-tight engagement within the support, and means to exhaust air through said basket to separate the foreign matter from the blanks, substantially as and for the purpose described.

16. In a button-blank-cutting machine, the combination of a support provided with a hollow die, an open-work basket beneath said die and within the support, an exhaust-pipe beneath the basket, and means to admit an additional supply of air above the basket, said basket having a tight engagement in the support whereby air will be drawn through the die and through the basket into the exhaust-pipe, substantially as and for the purpose described.

17. The combination with a button-blank-cutting machine provided with a hollow support and with a hollow die opening through said support, of an open-work receptacle located within said support beneath said die for receiving the blanks, an exhaust-pipe, and means to exhaust air through said die and receptacle into said exhaust-pipe, whereby the foreign matter will be separated from the blanks, as set forth.

18. In a button-blank-cutting machine, the combination of a rotatable mandrel, means to reciprocate the mandrel, a plunger within the mandrel, and a saw projecting within the mandrel and carried by the plunger, said plunger with its saw removable from the upper end of the mandrel, substantially as described.

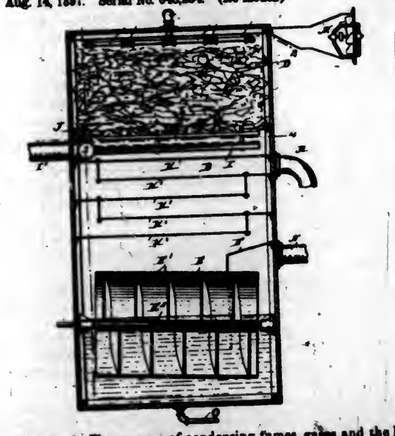
19. In a button-blank-cutting machine, the combination of a rotatable mandrel, means to reciprocate the mandrel, a plunger within the mandrel, a saw projecting within the mandrel attached to the lower end of the plunger, and means to longitudinally adjust and positively hold the plunger with the saw within the mandrel in a desired position of adjustment, substantially as described.

20. In a button-blank-cutting machine, the combination of a rotatable mandrel, means to reciprocate the mandrel, a plunger located within the mandrel, a saw projecting within the mandrel engaged with the plunger, a chuck to engage the saw toward its lower extremity, and additional means to adjust and hold the plunger and saw in desired position of adjustment within the mandrel, substantially as described.

21. In a button-blank-cutting machine, the combination of a rotatable mandrel, means to reciprocate the mandrel, an elongated plunger therewithin, an elongated tubular saw projecting within the mandrel engaged with the plunger, and means to adjust and hold the plunger within the mandrel in a desired position of adjustment, said plunger and saw removable from the upper end of the mandrel, substantially as set forth.

22. In a button-blank-cutting machine, the combination of a rotatable mandrel, a plunger therewithin, a tubular saw carried by the plunger, a chuck provided with jaws having a wedge-shaped engagement against the adjacent inner face of the mandrel, and bearing against the saw, and with a cap having a screw-threaded engagement upon the mandrel to give a desired tension of the chuck upon the saw, a plug within the saw to prevent too great a tension of the chuck upon the saw, a push-bar reciprocatory through said plug, and means to reciprocate the mandrel and the push-bar, substantially as set forth.

601,676. BRICK-CLEANING MACHINE. SAMUEL A. PRESCOTT, Wilkinsonville, Mass. Filed Feb. 2, 1897. Serial No. 621,648. (No model.)



Claim.—1. A machine for cleaning old bricks, consisting of frame A, bearings A' A' secured thereto, horizontal transverse shaft C fitted to turn in said bearings and means for turning said shaft, in combination with wheel B mounted on said shaft, the pins B' projecting laterally from the sides of said wheel, and casing D having openings D' at the sides to admit the bricks to be cleaned, and an opening at the bottom through which the mortar scraped from the bricks may be discharged, substantially as set forth.

2. The combination of frame A, bearings A' A' secured thereto, horizontal transverse shaft C fitted to turn in said bearings and means whereby said shaft may be turned, in combination with radial sections B^3, a central disk to which they are fastened, the holding side plates B^2 B^2 and peripheral plate B^1, the pins B' projecting laterally from the sides of the wheel, and casing D having openings D' at the sides to admit the bricks to be cleaned and an opening at the bottom through which the mortar scraped from the bricks may be discharged, substantially as set forth.

3. The combination of frame A, bearings A' A' secured thereto, horizontal transverse shaft C fitted to turn in said bearings and means whereby said shaft may be turned, in combination with wheel B com-

posed of radial sections B^3 a central disk to which they are fastened, the holding side plates B^1 B^2 and peripheral plate B^4, the pins B' projecting laterally from the sides of the wheel, casing D having openings D' at the sides to admit the bricks to be cleaned and an opening underneath through which the mortar removed from the bricks may be discharged, and means for adjusting said casing consisting of suitable bearings secured to the stationary part of the casing and frame A as described, suitable threaded spindles turning in said bearings and bearings on the movable side plates of the casing, substantially as set forth.

601,677. METHOD OF AND APPARATUS FOR CONDENSING FUMES OR GASES. HANNIBAL W. RAPPLEYE, Philadelphia, Pa. Filed Aug. 14, 1897. Serial No. 648,234. (No model.)

Claim.—1. The process of condensing fumes, gases and the like, which consists in holding water in temporary suspension and in diffusing it over a large area while so suspended, cooling the water while so suspended by passing a current of air through it, and directing the water so cooled and diffused upon the gases or fumes to be condensed.

2. The process of condensing fumes, gases and the like, which consists in holding water in temporary suspension and diffusing the same over a large area, cooling the water so suspended by a current of air, directing the water so cooled and diffused upon the gases or fumes to be condensed, and retarding the passage of the water through the same.

3. The process of condensing fumes, gases and the like within a condensing-chamber, which consists in holding water in temporary suspension and diffusing the same over a large area, cooling the water so suspended by a current of air, directing the water so cooled and diffused upon the gases or fumes to be condensed, retarding the passage of the water through the same, and then withdrawing such water from the condensing-chamber and again conveying it to the said medium.

4. In an apparatus for condensing fumes, gases and the like, the combination of a condensing-chamber having in its upper part a compartment containing a water suspending and diffusing medium, said compartment having a bottom adapted to permit the passage of the water therethrough, means to admit water into the upper part of said compartment, means for passing a current of air through said compartment to cool the water therein, and means to admit the fumes or gases to be condensed into said condensing-chamber beneath said compartment.

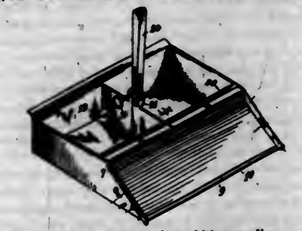
5. In an apparatus for condensing fumes, gases and the like, the combination of a condensing-chamber having in its upper part a compartment containing a water suspending and diffusing medium, said compartment having a bottom adapted to permit the passage of the water therethrough, means to admit water into the upper part of said compartment, means for passing a current of air through said compartment to cool the water therein, perforated walls in said condensing-chamber beneath said compartment, forming a passage for the fumes or gases to be condensed and adapted to permit the passage of the water through the perforations thereof, and means to admit the fumes or gases to be condensed into said passage.

6. In an apparatus for condensing fumes, gases and the like, the combination of a condensing-chamber having in its upper part a compartment containing a water suspending and diffusing medium, said compartment having a bottom adapted to permit the passage of the water therethrough, a water-inlet pipe, perforated water-distributing pipes arranged in the upper part of the condensing-chamber adapted to distribute water into the upper part of said compartment and communicating with the water-inlet pipe, an air-inlet pipe, perforated air-distributing pipes arranged in said condensing-chamber adapted to distribute air into the lower part of said compartment, an air-exhaust fan in connection with the upper part of said condensing-chamber adapted to withdraw the air from the air-distributing pipes upwardly through said compartment, and means to admit the fumes or gases to be condensed into said chamber beneath said compartment.

7. In an apparatus for condensing fumes, gases and the like, the combination of a condensing-chamber having in its upper part a compartment containing a water suspending and diffusing medium, said compartment having a bottom adapted to permit the passage of the water therethrough, a water-inlet pipe, perforated water-distributing pipes arranged in the upper part of the condensing-chamber adapted to distribute water into the upper part of said compartment and communicating with the water-inlet pipe, an air-inlet pipe, perforated air-distributing pipes arranged in said condensing-chamber adapted to distribute air into the lower part of said compartment, an air-exhaust fan in connection with the upper part of said condensing-chamber adapted to withdraw the air from the air-distributing pipes upwardly through the said compartment, perforated walls in said condensing-chamber beneath said compartment forming a passage for the fumes or gases to be condensed and adapted to permit the passage of the water through the perforations thereof, and a gas or fume inlet pipe communicating with the passage so formed.

8. In an apparatus for condensing fumes, gases and the like, the combination of a condensing-chamber having in its upper part a compartment containing a water suspending and diffusing medium, said compartment having a bottom adapted to permit the passage of the water therethrough, means to admit water into the upper part of said compartment, means for passing a current of air through said compartment to cool the water therein, means to admit the fumes or gases to be condensed into said condensing-chamber beneath said compartment, and a rotary spiral cylinder condenser in the lower part of the condensing-chamber.

9. In an apparatus for condensing fumes, gases and the like, the combination of a condensing-chamber having in its upper part a compartment containing a water suspending and diffusing medium, said compartment having a bottom adapted to permit the passage of the water therethrough, means to admit water into the upper part of said compartment, means for passing a current of air through said compartment to cool the water therein, perforated walls in said condensing-chamber beneath said compartment, forming a passage for the fumes or gases to be condensed and adapted to permit the passage of the water through the perforations thereof, means to admit the fumes or gases to be condensed into said passage, and a rotary spiral cylinder condenser in the lower part of the condensing-chamber.



10. In an apparatus for condensing fumes, gases and the like the combination of a condensing-chamber having in its upper part a compartment containing a water suspending and diffusing medium, said compartment having a bottom adapted to permit the passage of the water therethrough, a water-inlet pipe, perforated water-distributing pipes arranged in the upper part of the condensing-chamber adapted to distribute water into the upper part of said compartment and communicating with the water-inlet pipe, an air-inlet pipe, perforated air-distributing pipes arranged in said condensing-chamber adapted to distribute air into the lower part of said compartment, an air-exhaust fan in connection with the upper part of said condensing-chamber adapted to withdraw the air from the air-distributing pipes upwardly through said compartment, means to admit the fumes or gases to be condensed into said chamber beneath said compartment, and a rotary spiral cylinder condenser in the lower part of the condensing-chamber.

11. In an apparatus for condensing fumes, gases and the like, the combination of a condensing-chamber having in its upper part a compartment containing a water suspending and diffusing medium, said compartment having a bottom adapted to permit the passage of the water therethrough, a water inlet pipe, perforated water-distributing pipes arranged in the upper part of the condensing-chamber adapted to distribute water into the upper part of said compartment and communicating with the water-inlet pipe, an air-inlet pipe, perforated air-distributing pipes arranged in said condensing-chamber adapted to distribute air into the lower part of said compartment, an air-exhaust fan in connection with the upper part of said condensing-chamber adapted to withdraw the air from the air-distributing pipes upwardly through the said compartment, perforated walls in said condensing-chamber beneath said compartment forming a passage for the fumes or gases to be condensed and adapted to permit the passage of the water through the perforations thereof, a gas or fume inlet pipe communicating with the passage so formed, and a rotary spiral cylinder condenser in the lower part of the condensing-chamber.

12. In an apparatus for condensing fumes, gases and the like, the combination of a condenser-chamber having in its upper part a compartment containing a water suspending and diffusing medium, said compartment having a bottom adapted to permit the passage of the water therethrough, a water-inlet pipe, perforated water-distributing pipes arranged in the upper part of the condensing-chamber adapted to distribute water into the upper part of said compartment and communicating with the water-inlet pipe, an air-inlet pipe, perforated air-distributing pipes arranged in said condensing-chamber adapted to distribute air into the lower part of said compartment, an air-exhaust fan in connection with the upper part of said condensing-chamber adapted to withdraw the air from the air-distributing pipes upwardly through the said compartment, perforated walls in said condensing-chamber beneath said compartment forming a passage for the fumes or gases to be condensed and adapted to permit the passage of the water through the perforations thereof, a gas or fume inlet pipe communicating with the passage so formed, a rotary spiral cylinder condenser in the lower part of the condensing-chamber, a water-exit pipe leading from the lower part of said condensing-chamber in connection with the water-inlet pipe, and means interposed in said water-pipe connection from the lower to the upper part of the condensing-chamber to force the water therethrough.

13. In an apparatus for condensing fumes, gases and the like, the combination of the condensing-chamber of an open-work flooring in the upper part of the condensing-chamber sustaining a water suspending and diffusing medium, an air-inlet pipe, perforated air-distributing pipes beneath the open-work flooring communicating with the air-inlet pipe, a perforated horizontal partition beneath the air-distributing pipes, perforated staggered horizontal walls beneath the said partition forming a passage for the fumes or gases, a gas or fume inlet pipe communicating with the passage so formed, a rotary spiral cylinder condenser in the lower part of the condensing-chamber, a water-pipe connection between the lower part of the condensing-chamber and the upper part thereof, water-distributing pipes in the upper part of the condensing-chamber communicating with said pipe connection, an air-exhaust fan in connection with the upper part of the condensing-chamber adapted to establish a current of air in the condensing-chamber upwardly from the air-distributing pipes, and means interposed in the water-pipe connection to force the water therethrough from the lower to the upper part of the condensing-chamber, substantially as described.

601,678. SCRUBBING APPLIANCE. FREDERICK W. RICHTER, Chicago, Ill. Filed June 3, 1897. Serial No. 639,365. (No model.)

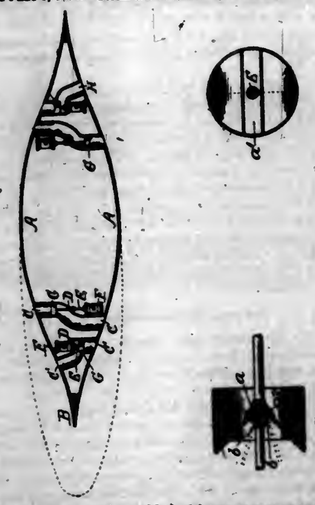
Claim.—1. The herein-described scrubbing appliance comprising a substantially rectangular tray, an inclined upwardly and rearwardly disposed side to said tray, and a correspondingly-inclined lip or guard projecting from the opposite side of the tray, the said inclined side being provided with end flanges or guards extending above its upper surface, substantially as described.

2. The herein-described scrubbing appliance comprising a substantially rectangular water tray or receptacle, a gradually inclining or slanting side to said receptacle, vertically-disposed flanges or guides at the extremities of said inclined side, and an adjustable handle secured within said tray, substantially as and for the purpose described.

3. The herein-described scrubbing appliance comprising a tray or receptacle having an inclined front, a transverse lip projecting rearward from the upper edge of the back of the tray or receptacle, a vertical partition disposed longitudinally of the tray or receptacle and provided at its ends with openings, and an adjustable handle mounted on the partition, substantially as described.

4. The herein-described scrubbing appliance comprising a tray or receptacle having an inclined front and provided at the ends thereof with vertical flanges extended beyond the inclined front to form guards, and a flexible strip secured to the bottom of the tray or receptacle at the front thereof, adapted to fit closely against a floor or other supporting-surface and terminating short of the projecting ends of the flanges, substantially as described.

5. In a device of the class described, the combination with a tray or receptacle provided at its front with a strip, of guards located at opposite sides of the tray or receptacle, yieldingly mounted on the same and projecting beyond the strip to form cushions, substantially as described.



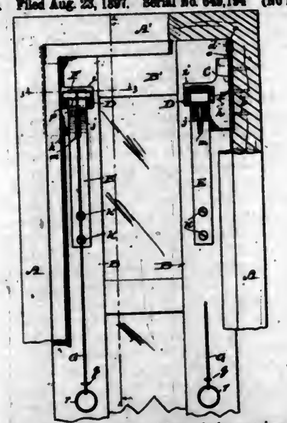
6. In a device of the class described, the combination with a tray or receptacle, of a pair of plates pivoted at opposite sides thereof and projecting forward therefrom to form guards, and springs mounted on the tray or receptacle and connected with the inner or rear portions of the plates, whereby the latter are yieldingly mounted and form cushions, substantially as described.

7. In a device of the class described, the combination of a tray or receptacle having an inclined front extended beyond the bottom to form a transverse recess, a flexible strip provided with a rigid binding-strip and extending beyond the inclined front, and guard-plates arranged at opposite sides of the tray or receptacle and extending beyond the flexible strip, substantially as described.

8. In a device of the class described, the combination of a tray or receptacle having an inclined front extending beyond the bottom and forming a transverse recess, bosses arranged in the recess and provided with threaded openings, a flexible strip provided at its inner edge with a binding-strip and arranged on the bottom of the tray and projecting beyond the front thereof, and screws passing through the flexible strip and the binding-strip and engaging the threaded openings of the lugs, substantially as described.

9. In a device of the class described, the combination of a tray or receptacle having an inclined front, provided at its upper or rear edge with a depending flange, and a transverse scraper-bar mounted on the tray or receptacle and located slightly in rear of the inclined front in position to be engaged by a squeegee or scraper after the same has been swept up the inclined front, said scraper being curved in cross-section and presenting a convex upper face and a concave lower face, substantially as described.

601,679. HYDRAULIC STEERING MECHANISM FOR VESSELS. JOHN RITCHIE and HARVEY W. RITCHIE, Cook County, Ill. Filed June 9, 1897. Serial No. 639,947. (No model.)



Claim.—1. A vessel provided with two or more passages extending transversely through the hull and having propeller-shafts located in said passages which are adapted to have a reciprocating endwise movement therein, and propellers, mounted on said shafts, substantially as described.

2. A vessel provided with transverse passages through the hull and opening outwardly from each side thereof, propeller-shafts entering said passages through the side walls and having a reciprocating endwise movement therein, and propellers, having an opening and closing action and mounted on the outer ends of said shafts; the inner ends connecting with the motive power, substantially as described.

3. A vessel having transverse passages through the hull which curve from a right line to provide an offset, propeller-shafts extending into said passages and having a reciprocating endwise movement therein and having propellers mounted on the outer working ends thereof; the inner ends of said shafts connecting with the motive

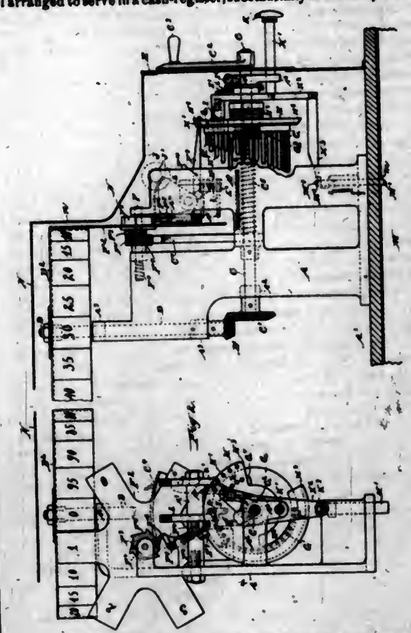
power, and each propeller being adapted to be operated independently of the other, substantially as described.

601,680. DETACHABLE SASH. WILLIAM ROMUNDER, Milwaukee, Wis. Filed Aug. 23, 1897. Serial No. 649,194. (No model.)

Claim.—1. The combination with a window casing, of movable socket-hinges attached thereto, said movable sockets having exterior latches projecting therefrom, a detachable sash adapted to fit within said hinge-sockets, and slotted catches secured to said sash for engagement with said latches, substantially as set forth.

2. The combination with a window-casing, of movable socket-hinges attached thereto, and provided with exterior projecting latches, a detachable sash adapted to fit within said hinge-sockets, slotted catches secured to said sash for engagement with said latches, and devices for releasing said catches from said engagement, substantially as set forth.

3. The combination with a window-casing, having projecting latches, of a detachable sash and slotted spring-catches secured at their lower ends to said sash for engagement with said latches, slotted cylinders loosely connected to the free top ends of said catches, and cords, wires or chains secured to said cylinders adjacent to their points of connection with said catches, substantially as set forth.



4. The combination with a window-casing, of stationary hinge-plates secured thereto, movable hinge-plates pivotally secured to said stationary plates and having right-angled flanges projecting therefrom forming open sockets, and latches projecting from the exterior of said sockets, a detachable sash adapted to fit within said sockets, and slotted spring-catches secured to said sash for engagement with said latches, substantially as set forth.

601,681. CASH-REGISTER. ROBERT A. W. ROSANDER and JOHN R. PEARSON, Brooklyn, N. Y., assignors of thirteen-twentieths to Frank C. Gaffney, same place. Filed June 16, 1897. Serial No. 640,955. (No model.)

Claim.—1. In a cash-register, two indicators, one bearing a series of numbers indicating dollars and the other a series indicating fractions thereof, adapted to be exposed at an opening in the casing in proper relation to each other, in combination with a single lever connected to both, adapted when swung in one direction to operate the dollars-indicator and in the other direction to operate the fractional indicator, a registering mechanism, and a single thrust-rod operating the registering mechanism to register both numbers, all substantially as herein specified.

2. In a cash-register, a drum bearing a series of numbers indicating the fractional parts of a dollar, a shaft connecting to the drum, a disk bearing a series indicating the dollars and operated from the same shaft, an opening in the casing through which the said figures indicating the amount of the purchase in dollars and fractions are exposed in proper relation to each other, a lever fixed to the shaft to turn the latter, and connections whereby the movement of the lever in one direction operates the dollars-indicator and in the other direction operates the fractional indicator, all combined and arranged to serve substantially as herein specified.

3. A shaft, a drum bearing a series of numbers indicating fractional parts of a dollar and turning with the shaft, and an operating-lever fixed to the shaft, in combination with a disk bearing a series of numbers indicating dollars, a pinion connected to said disk and a toothed segment carried by said shaft and meshing with said pinion, all arranged to serve in a cash-register, substantially as herein specified.

4. A shaft, a drum bearing a series of numbers indicating fractional parts of a dollar and turning with the shaft, and an operating-lever fixed to the shaft, in combination with a disk bearing a series of numbers indicating dollars, a loose pinion connected to said disk to turn the latter in one direction and move idly in the opposite direction, a holding means adapted to prevent the reverse movement of the disk, and a toothed segment mounted on said shaft and meshing into said pinion, all substantially as herein specified.

5. In a cash-register, a shaft operating an indicator, in combination with a disk carrying a series of pins of different lengths corresponding to the numbers on the indicator and adapted when thrust forward to present to the registering mechanism the pin corresponding to the number to be registered and to operate said registering mechanism to an extent governed by the length of the pin, all substantially as herein specified.

6. In a cash-register, a drum bearing a series of numbers indicating fractional parts of a dollar, a disk bearing a series indicating dollars, and a shaft operating both indicators, in combination with disks or plates arranged to slide on said shaft, each carrying a series of pins of differing lengths, those on one disk corresponding to the numbers on one indicator and the others to those on the other indicator, adapted when thrust forward to present to the registering mechanism the pins corresponding to the dollars and fractions thereof and operate the registering mechanism to an extent governed by the length of such pins, all substantially as herein specified.

7. In a cash-register, two indicators, one bearing a series of numbers indicating dollars and the other a series indicating fractions thereof, adapted to be exposed at an opening in the casing in proper relation to each other, in combination with a single lever connected to both, adapted when swung in one direction to operate the dollars-indicator and in the other direction to operate the fractional indicator, a registering mechanism, a drawer-opening mechanism, and a single thrust-rod operating the registering mechanism to register both numbers and also release said drawer, all substantially as herein specified.

8. The shaft C, the pointer C^3 and toothed segment C^4 fixed on said shaft, the gears C′ and D′, shaft D and drum D^2 mounted thereon, in combination with the shaft F, the spider-disk F^2 and the ratchets F^4 and F^6 fixed thereon, the loose pinion F′ meshing with said toothed segment and having a pawl F^5 engaging one of said ratchets, a dog F^6 engaging the other ratchet, and the torsional spring F^{11} tending to turn the said shaft F in opposition to the dog and its ratchet, all substantially as herein specified.

9. The drum D^2 and spider-disk F^2 and their operating means, in combination with the ratchet F^6 on said disk, the dog F^6 engaging said ratchet, and the spring-actuated slide F^7 and releasing-lever F^8, and means for operating the latter all substantially as herein specified.

10. The shaft C and its spider-disk and drum bearing respectively a series of numbers indicating dollars and a series indicating fractions thereof, in combination with the disk G and plate H arranged to slide on said shaft, each bearing a series of pins G′, H′ of differing lengths, a registering mechanism for each series consisting of a slotted yoke L^2, guides A^5 therefor, toothed segment L having thd arm L^3 and pin L^4 engaged in said yoke, and meshing with the wheel J, the said yoke adapted to be struck by one of the pins in the series and be driven to an extent determined by the length of the pin, and correspondingly move the said registering mechanism, all substantially as herein specified.

11. The shaft C and its pointer C^3, the sleeve G^2 mounted on the shaft and turning therewith and adapted to slide axially thereon, the disk G and its series of pins G′ fixed on the sleeve, the plate H and its series of pins H′ mounted on the said sleeve with liberty to turn thereon, a torsional spring H^3 connecting said plate and sleeve, a lug G^4 carried by said disk and engaging said plate to turn the latter when the shaft is turned in one direction, the sliding bolt I adapted to engage one of a series of cavities A on said plate, the arm K^5 mounted on the said sleeve and carrying said bolt, the rod K′ and its knob K whereby the disk and plate may be thrust inward on said shaft, and a registering mechanism adapted to be operated to varying extents depending on the lengths of the pins presented thereto, all combined and arranged to serve substantially as and for the purpose herein specified.

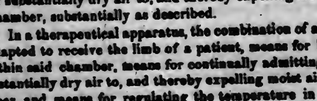
12. The drum D^2 and spider-disk F^2, and their operating means, in combination with the ratchet F^6 on said disk, the dog F^6 engaging said ratchet, slide F^7, releasing-lever F^8, and the plate H having the beveled edge H^2 adapted when thrust forward to engage and lift the free end of said lever and release said spider-disk, all substantially as herein specified.

13. The drum D^2 and spider-disk F^2, and their operating means, in combination with the ratchet F^6 on said disk, the dog F^6 engaging said ratchet, slide F^7, releasing-lever F^8, and the plate H having the beveled edge H^2, and the dog H^7 carried by said plate, adapted to lift the free end of the lever and release the spider-disk when the plate is turned in one direction, all substantially as herein specified.

14. The plate H mounted on the sleeve G^2 and having the series of pins H′ of differing lengths and a corresponding series of cavities A, in combination with the sliding bolt I adapted to engage said cavities, the lever I′ controlling the bolt and having the groove i, the dog I^2 adapted to be struck by said lever and thereby withdraw said bolt, the lug G^4 on said sleeve adapted to lift said dog when presented to the latter and allow it to lie inoperatively in said groove, all substantially as herein specified.

15. The sleeve G^2 turning with the shaft C and free to slide axially thereon, the disk G fixed on said sleeve, the plate H carried by the sleeve with liberty to turn thereon, the series of pins G′ and H′ carried by said disk and plate and adapted to operate a registering mechanism, the arm K^5 inclosing said sleeve and moving axially therewith, a beveled extension K^6 carried by the arm, a spring-catch M′ controlling the cash-drawer M, operated by said extension, and the rod K′ and single knob K for operating the registering mechanism and releasing the cash-drawer by a single thrust, all combined and arranged to serve substantially as herein specified.

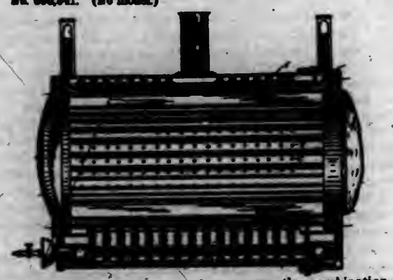
601,682. FENCE-STAY. WILLIAM H. ROYER, Painter Creek, Ohio. Filed Aug. 9, 1897. Serial No. 647,626. (No model.)



Claim.—1. As a new article of manufacture, a stay or fastener for fence-wires comprising a supporting-plate formed of a strip of metal folded upon itself, and having one of its ends bent to form a substantially horizontal flange, and a fastening-wire supported in the loop formed by folding the said strip and projecting at each end beyond the side edges of the supporting-plate, substantially as described.

2. The combination with a fence-wire, and a fence-post having a horizontally-disposed kerf or recess formed therein, of a stay comprising a supporting-plate having a flange at its lower end to fit in said kerf, a fastening-wire supported by said plate with its ends extending beyond the side edges of the plate, said extended ends being coiled around the fence-wire, and a device to secure the plate to the post, substantially as described.

3. The combination with a fence-wire, and a fence post having a horizontally-disposed kerf or recess formed therein, of a stay comprising a supporting-plate formed of a strip of metal folded upon itself and having one of its ends bent to form a substantially horizontal flange to fit in said kerf, and a fastening-wire supported in the loop formed by folding the said metal strip, said wire extending at each end beyond the side edges of the supporting-plate, and the extending ends being coiled around the fence-wire, and a nail driven through an opening in the supporting-plate and the fence post and being clenched, substantially as and for the purpose specified.



601,688. SWIVEL HOSE-COUPLING. DE WARE B. SMITH, Deerfield, N. Y. Filed Oct. 18, 1897. Serial No. 655,561. (No model.)

Claim.—1. The combination in a hose-swivel of the tubular body having one end screw-threaded, and the other flared, of a sleeve mounted on the body and having a rounded end conforming on the exterior with the flared end of the body, substantially as set forth.

2. The combination with the hose of a swivel consisting of a tubular body having a screw-thread at one end and flared at the other end, of a sleeve mounted on the body the end of the sleeve and flared end of the body being made to conform whereby the hose covers and closes the joint, substantially as set forth.

601,684. THERAPEUTICAL APPARATUS. AUSTIN V. M. SPRAGUE, Brooklyn, N. Y. Original application filed Feb. 18, 1897, Serial No. 623,905. Divided and this application filed Dec. 6, 1897. Serial No. 660,841. (No model.)

Claim.—1. In a therapeutical apparatus, the combination of a chamber adapted to receive or to be applied to a part of the human body, means for maintaining the temperature within said chamber above the boiling-point of water and means for admitting such a current of dry air to said chamber as will remove the vapors arising from the part of the body being treated as rapidly as they are generated, substantially as described.

2. In a therapeutical apparatus, the combination of an air-chamber adapted to receive the limb of a patient, means for continually heating, and maintaining the temperature of, the air within said chamber above the boiling-point of water, and means for admitting such volume of air to said chamber as to continually effect the displacement of the accumulating vapor, substantially as described.

3. In a therapeutical apparatus, the combination of an air-chamber adapted to receive the limb of a patient, means for heating the air within said chamber, and means for continually admitting a current of substantially dry air to, and thereby expelling moist air from, said chamber, substantially as described.

4. In a therapeutical apparatus, the combination of an air-chamber adapted to receive the limb of a patient, means for heating the air within said chamber, means for continually admitting a current of substantially dry air to, and thereby expelling moist air from, said chamber, and means for regulating the temperature in said chamber, substantially as described.

5. In a therapeutical apparatus, the combination of an air-chamber adapted to receive the limb of a patient, means for heating the air within said chamber, a series of tubes for continually admitting a current of substantially dry air to said chamber to expel moist air therefrom and another series of tubes for continually discharging

said moist air from said chamber, dampers for each of said series of tubes, and means for operating said dampers, substantially as described.

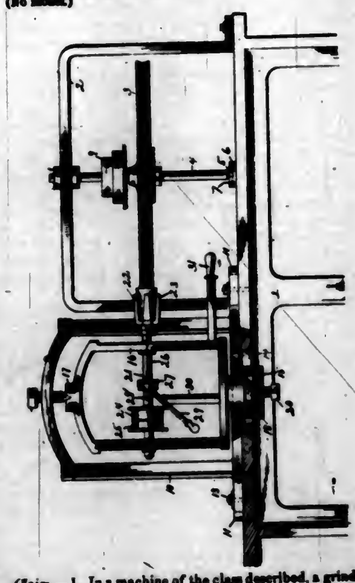
6. In a therapeutical apparatus, the combination of an air-chamber adapted to receive the limb of a patient, means for heating the air within said chamber, a series of tubes for continually admitting a current of substantially dry air to said chamber to expel moist air therefrom and another series of tubes for continually discharging said moist air from said chamber, dampers for each of said series of tubes, and a lever for simultaneously operating said dampers, substantially as described.

7. In a therapeutical apparatus, an air-chamber adapted to receive the limb of a patient and provided with ventilative openings, a flue surrounding said air-chamber, and a source of heat communicating therewith and situated below said air-chamber and in contiguity to said openings so as to induce a current of substantially dry air to said chamber, substantially as described.

8. In a therapeutical apparatus, an air-chamber provided with ventilative openings, a perforated casing arranged within said chamber and adapted to receive the limb of a patient, a flue surrounding said air-chamber, and a source of heat communicating therewith and situated below said chamber and in contiguity to said openings so as to induce a current of substantially dry air to said chamber, substantially as described.

9. A therapeutical apparatus consisting of the concentrically-arranged inner, intermediate and outer casings, the inner casing being perforated and adapted to receive the limb of a patient and the outer casing being open at the top and bottom, a heating apparatus beneath said bottom opening in the outer casing, a series of tubes communicating with the intermediate casing and projecting through the bottom opening in the outer casing and below the heating apparatus, another series of tubes communicating with the top of said intermediate casing and extending through the outer casing, one of said series of tubes being adapted to admit fresh air to, and the other of said series of tubes being adapted to discharge moist air from, the intermediate casing, slide-dampers for controlling the supply of air through the tubes, and an operating lever for simultaneously operating the damper of each of said series of tubes, substantially as described.

10. A therapeutical apparatus consisting of the concentrically-arranged inner, outer and intermediate cylinders, the inner cylinder being perforated, adapted to receive the limb of a patient and provided with internally-arranged protective pads, the intermediate cylinder having a series of tubes for admitting fresh air at the bottom thereof, and the outer cylinder having an opening at the top and bottom, means situated beneath said bottom opening in the outer cylinder for heating the air therein and in the intermediate cylinder, slide-dampers for the tubes arranged on the intermediate cylinder, an operating-lever for the dampers fulcrumed on the outer cylinder and adapted to simultaneously adjust said dampers, a gage for the lever, a door adapted to close the cylinders at one end and provided with an observation-port, and a flexible covering secured to the other end of the outer cylinder, substantially as described.



11. In a therapeutical apparatus, the combination of an air-chamber adapted to receive the limb of a patient, a plurality of parallel burners for heating the air within said chamber and situated below the same, and lower or inlet tubes and upper or outlet tubes communicating with said chamber, said lower tubes being arranged between and having their mouths situated slightly below said burners and said burners being adapted to induce ventilative streams of fresh air through the tubes and the chamber, substantially as described.

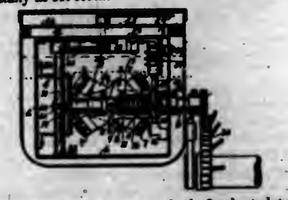
12. In a therapeutical apparatus, an air-chamber adapted to receive the limb of a patient and provided with means for continually ventilating said chamber, a flue surrounding said chamber, and a heating apparatus situated beneath and communicating with said flue and adapted to induce a heated, continuous and enveloping current of air into contact with said air-chamber, substantially as described.

13. In a therapeutical apparatus, an air-chamber adapted to receive the limb of a patient and provided with upper and lower ventilative openings, a flue surrounding said air-chamber, and a heating apparatus communicating with said flue and situated contiguous to the lower ventilative openings in the air chamber, and adapted to induce a heated, continuous and enveloping current of air into contact with said chamber and to project streams of fresh air through said ventilative openings in the chamber, substantially as described.

14. In a therapeutical apparatus, the combination with an operating-chamber adapted to receive the limb of a patient and provided with a supporting-frame, of a base therefor, a vertical externally-threaded pedestal telescoped into said base, an adjusting internally-threaded hand-wheel for the pedestal operating thereon and resting on the base, laterally-extending arms carried by said pedestal, an extension projecting forwardly and upwardly from the end of one of said arms, an axis for said chamber rigidly secured to the frame and having bearings in said arms, an upwardly-extending lever secured to the end of said axis adjacent to the extension, and an adjusting hand-screw for tilting said chamber operating in the upper end of the extension and having a ball-and-socket connection with the lever, substantially as described.

601,685. MACHINE FOR CUTTING AND SMOOTHING TUMBLERS. ADAMS STREETER, Morgantown, W. Va., assignor to the Seneca Glass Company, same place. Filed Nov. 3, 1897. Serial No. 657,945. (No model.)

Claim.—1. In a machine of the class described, a grinding-wheel, a supporting-frame arranged adjacent to said grinding-wheel and capable of adjustment, a holding-frame rotatably mounted within said supporting-frame, and a rotating tumbler-holder carried by said holding-frame, said holder rotating at right angles to the plane of rotation of said grinding-wheel, substantially as described.



2. In a machine of the class described, a grinding-wheel, a supporting-frame arranged adjacent to said grinding-wheel and capable of adjustment, a holding-frame rotatably mounted within said supporting-frame, a rotating tumbler-holder carried by said holding-frame, said holder rotating at right angles to the plane of rotation of said grinding-wheel, and means for removing the tumbler from the holder, substantially as described.

3. In a machine of the class described, a grinding-wheel, a supporting-frame arranged adjacent thereto and capable of adjustment, a bearing carried by the supporting-frame, a holding-frame arranged within the supporting-frame and provided at its upper and lower ends with bearing-lugs, the lower of said lugs being arranged within the bearing carried by the supporting-frame, adjusting-screws for retaining the holding-frame within the supporting-frame, a tumbler-holder carried by the holding-frame and arranged in the same plane as the grinding-wheel, and means for removing the tumbler from said holder, substantially as described.

4. In a machine of the class described, a grinding-wheel, a supporting-frame arranged adjacent thereto and capable of adjustment, a bearing formed in the supporting-frame, a holding-frame rotatably mounted within said supporting-frame and provided at its upper and lower ends with bearing-lugs, the lower of said lugs being disposed within the bearing of the supporting-frame, adjusting-screws for retaining the holding-frame within the supporting-frame, a tubular shaft carried by the holding-frame, a tumbler-holder mounted upon said shaft and arranged in the same plane as the grinding-wheel, an extracting-rod disposed within said tubular shaft for removing the tumbler from the holder, and means for actuating said rod, substantially as described.

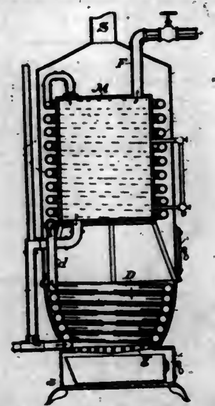
601,686. MECHANISM FOR INDICATING TRAVEL OF BICYCLES, &c. WILLIAM B. STUBBS, Chester, Pa. Filed Dec. 23, 1896. Serial No. 616,794. (No model.)

Claim.—1. In a speed-indicator for bicycles, and other wheeled vehicles, the combination of the rotatable shaft adapted to be driven by the wheel of the vehicle, the spring-controlled cross-bars pivoted to the said shaft, the sliding part supported by the latter, connections between said part and cross-bars, whereby when the latter are moved outwardly on their pivot by centrifugal motion induced by the rotation of said shaft, an outward longitudinal movement will be imparted to the sliding part, means for preventing the rotation of said part, together with the rock-shaft and its arm against which latter the outer end of the said sliding part is adapted to bear, said arm being adjustable toward and away from the axis of said shaft, the index connected with said rock-shaft, and a spring adapted to always maintain the said arm of the rock-shaft in contact with the sliding part, substantially as set forth.

2. The combination of the rotatable shaft adapted to be driven by the wheel of a bicycle or the like, the spring-controlled bars pivoted thereto, the sliding pin, suitable connections between said pin and bars, the spring-controlled rock-shaft, an arm secured thereto against which said pin is adapted to impinge, means for adjusting said arm toward and away from the axis of the rock-shaft, the index-carrying arbor, and suitable connections between said rock-shaft and arbor; the construction and arrangement being substantially as described, whereby the movement of said pin is transmitted to the said arbor substantially as and for the purpose set forth.

3. The combination of the rotatable shaft adapted to be driven by the wheel of a bicycle or the like, the spring-controlled cross-bars pivoted thereto, the sliding pin supported by said shaft, the sliding yoke engaging studs or projections of said cross-bars, and also adapted to impinge against said pin, the rock-shaft, an arm secured thereto and adjustable toward and away from the axis thereof, against which the pin impinges, the segment-gear carried by said rock-shaft, the index-carrying arbor, the gear thereon engaging said segment, and the spring for controlling the arbor and its adjuncts or connections, all constructed and adapted to operate substantially as and for the purpose set forth.

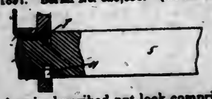
4. The combination of the rotatable shaft adapted to be driven by the wheel of a bicycle or the like, the cross-bars pivoted to said shaft, the pin adapted to slide in the end of the shaft, the spring-controlled reciprocating yoke, having its crown impinging against said pin, and connected to said cross-bars substantially in the manner and by the means shown and described, the spring controlled rock-shaft, the index-carrying arbor, suitable gearing connecting said arbor and rock-shaft, together with the disk against whose edge the said sliding pin is adapted to bear and the adjusting, disk-carrying screw secured to said rock-shaft, substantially as and for the purpose set forth.



5. In mechanism of the character described, the combination of the rotatable shaft adapted to be driven by the wheel of a bicycle or other vehicle, the cross-bars pivoted to the said shaft, a sliding part carried by the said shaft and operatively connected with said cross-bars, the spring acting upon the said sliding part, the spring-controlled rock-shaft, the index-carrying arbor, suitable gearing connecting said arbor and rock-shaft, together with an arm secured to said rock-shaft and against which said sliding part is arranged to impinge, said arm being adjustable toward and away from the axis of the said rock-shaft, substantially as set forth.

6. The combination of the rotatable shaft adapted to be rotated by the wheel of a bicycle or the like, the arbor having the index secured thereto, mechanism substantially as described, whereby said index is caused, through the rotation of said driven shaft, to oscillate in correspondence with the speed of travel of the bicycle, or the like, and consequent speed of rotation of said shaft; together with a rotatable shaft, as 36, suitably geared to the last-mentioned shaft, a gear, as 38, a worm, 37, or the like, upon shaft, 36, engaging said gear, said gear having a tooth or projection; together with the rotatable annulus provided with teeth or projections with which the projection of the gear, 38, is adapted to consecutively engage, substantially as and for the purpose set forth.

7. In mechanism of the character described, the combination of the rotatable shaft adapted to be driven by the wheel of a bicycle or other vehicle, the cross bars pivoted to said shaft, the sliding part carried by said shaft and operatively connected to said cross-bars, the spring arranged to act upon said sliding piece in opposition to the centrifugal action of the said cross-bars induced by the rotation of said shaft, the spring-controlled rock-shaft, an index-carrying arbor, suitable gearing connecting said arbor and rock-shaft, and an arm secured to said rock-shaft and against which the outer end of said sliding part is arranged to impinge, said arm being adjustable toward and away from the axis of the said rock-shaft, together with a distance-measuring device geared to the first-named shaft, substantially as set forth.



8. In mechanism of the character described, the combination with a sliding part, centrifugally-acting devices connected to said part to impart an endwise movement thereto in one direction, a spring arranged to act upon said sliding part in opposition to the action of the centrifugal devices, of an index-carrying arbor, a rock-shaft geared to said arbor, and an arm secured to said rock-shaft and forming a bearing for the said sliding part, said arm being adjustable toward and away from the axis of the said rock-shaft, substantially as set forth.

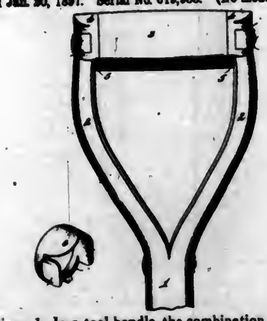
601,687. STEAM OR HOT-WATER HEATER. FRED SOOGLE, Brewer, Me. Filed Feb. 6, 1897. Serial No. 622,381. (No model.)

Claim.—The furnace, the boiler located above the fire-pot, a coil of pipe connected at its upper end to the boiler and extending spirally around it, and a second coil arranged inside of the fire-pot of the furnace, and forming a continuation of the coil which surrounds the boiler; a blow-off pipe, a pipe connected with both the blow-off pipe and the bottom of the boiler, a return-pipe, and a support for the boiler extending up from the top of the fire-pot, substantially as shown and described.

601,688. NUT-LOCK. SAMUEL W. TELFORD, Little Rock, Ark. Filed Mar. 1, 1897. Serial No. 625,653. (No model.)

Claim.—The herein-described nut-lock comprising the combination with a bolt having a screw-threaded extension and an annular groove at the base of said extension in which is formed a plurality of ratchet-teeth of a nut mounted on said screw-threaded extension, a pawl mounted in a chamber at the inner end of said nut and adapted to engage the ratchet-teeth formed in said groove and a lever mounted in a longitudinal bore or passage in said nut and provided at the outer end with an angular extension and at the inner end with a loop through which said pawl passes, substantially as and for the purpose described.

601,689. HOSE-COUPLING RESHAPER. GEORGE W. WALLIS, Saginaw, Mich. Filed Aug. 9, 1897. Serial No. 647,650. (No model.)



Claim.—1. A re-former for the nut-sections of hose-couplings, comprising a cylinder made of four or more duplicate sections held together by rubber bands fitting recesses in each end thereof, the sections held in alinement by a central ring fitting into a groove in each section, in line, a screw-threaded portion and a smooth portion on the outer surface of the sections adapted to engage the threaded portion of the coupling and the inner surface of the tailpiece respectively, a

central tapering core in the cylinder so constructed, and a mandrel having a conical portion adapted to pass into the tapering core of the cylinder and expand the same by forcing the sections apart and against the wall of the coupling and tailpiece, as and for the purpose set forth.

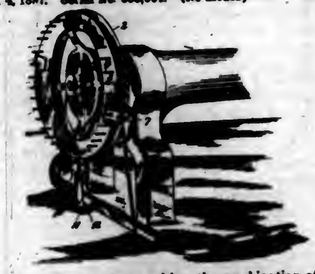
2. In a hose-coupling reshaper comprising a cylinder made up of sections, and means for expanding the same, the means for holding the sections thereof in transverse alinement comprising a horizontal groove in each section, in line and on the inside thereof, and a ring adapted to fit the groove in each section and thereby hold the sections in transverse alinement, as specified.

601,690. TOOL-HANDLE. JOHN P. WALTER, Edgerton, Ohio. Filed Jan. 20, 1897. Serial No. 619,955. (No model.)

Claim.—1. In a tool-handle, the combination with the hand-grip and the forked handle, of a ferrule fitted on the end of the hand-grip and having an integral pin to project into the side of the prong, integral wings adapted to be bent over onto the side of the prong, and an integral cap to fit over the end of the prong, substantially as described.

2. As a new article of manufacture, a ferrule comprising a ring portion, and a cap, side wings, and a pin or point, all projecting laterally in one direction from one face of the ring, substantially as described.

601,691. TREE-BOX. WILLIAM B. WATSON, Richmond, Ind., assignor of one-half to Seth F. Watson, same place. Filed Sept. 8, 1897. Serial No. 650,896. (No model.)

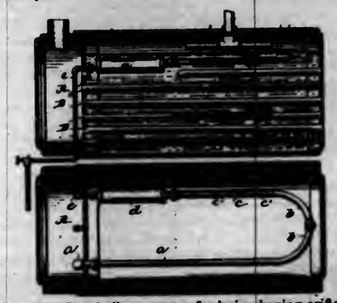


Claim.—1. A metallic tree-box comprising a number of rods arranged at intervals in circular form, and a ring at the upper end of said rods formed of angular sections pivoted together and adapted to be manipulated in the manner for the purpose substantially as described.

2. A metallic tree-box comprising a number of rods arranged in circular form by the employment of attached rings, a ring at the upper end of said rods formed of angular perforated sections pivoted together, and a band for the tree-trunk having tongues for engaging the perforations in the sections, substantially as described.

3. A metallic tree-box comprising a number of rods arranged in circular form by the employment of rings, a ring at the upper end of said rods formed of angular sections pivoted together, a band for the tree-trunk having tongues for engaging perforations in the upper ring, and means for anchoring the box to the ground consisting of points on the box, and pegs adapted for insertion in the ground and having bolt connection with the lowermost ring.

601,692. SEWING-MACHINE BRAKE. JOHN R. WEAVER, Commerce, Tex., assignor of one-half to Mike St. Clair, same place. Filed Oct. 4, 1897. Serial No. 653,961. (No model.)



Claim.—1. In a sewing-machine, the combination of a series of pins supported to move with the shaft and concentric therewith, a vertical standard secured to the table, and a gravity-dog pivoted intermediate its ends to the upper end of the standard, with its upper end lying in the path of travel of the pins and its lower end normally engaging the standard, substantially as described.

2. In a sewing-machine, the combination with the shaft and the hand-wheel mounted thereon, of a ring secured to the hand-wheel and concentric to the shaft, a series of pins projecting outwardly from said ring, a vertical standard secured to the table of the machine, and a gravity-dog pivoted intermediate its ends to the upper end of said standard, with its upper end lying in the path of travel of said pins and its lower end normally engaging the standard, substantially as described.

3. In a sewing-machine, the combination with the shaft and the hand-wheel mounted thereon, of a flat metal ring of substantially the same diameter as the hand-wheel, a series of pins projecting outwardly from said ring, U-shaped clips adapted to embrace the peripheries of the hand-wheel and the ring, said clips having perforations near each end one of said perforations fitting over one of the pins, and the other perforation serving as a seat for a set screw to engage the inner face of the hand-wheel, a standard secured to the machine-table, and a gravity-dog pivoted to said standard with its upper end lying in the path of travel of said pins, substantially as described.

601,693. WATER-FEED FOR BOILERS. ALFRED B. WILLOUGHBY, Philadelphia, Pa. Filed May 18, 1897. Serial No. 637,095. (No model.)

Claim.—1. In a boiler, a water-feed pipe having orifices in said pipe within the boiler at the desired point for delivery of the water, a pipe secured to and extending beyond said pipe, the water-feed pipe opening into said last-mentioned pipe at or near its upper end, said last-mentioned pipe extending below the adjacent section of the water-feed pipe, and a normally-closed discharge-pipe opening from said extension-pipe at or near its lower end.

2. In a boiler, a water-feed pipe having orifices in said pipe above the horizontal center of the pipe within the boiler at the desired point for delivery of the water, a pipe secured to and extending beyond said pipe, the water-feed pipe opening into said last-mentioned pipe at or near its upper end, said last-mentioned pipe extending below the adjacent section of the water-feed pipe, and a normally-closed discharge-pipe opening from said extension-pipe at or near its lower end.

3. In a boiler, a water-feed pipe having orifices in said pipe within the boiler at the desired point for delivery of the water, a pipe secured to and extending beyond said pipe, the water-feed pipe opening into said last-mentioned pipe at or near its upper end, said last-

mentioned pipe extending below the adjacent section of the water-feed pipe, and a normally-closed discharge-pipe extending from said extension-pipe at or near its lower end, and a valve upon the discharge-pipe adapted when operated to open said pipe.

4. In a boiler, a water-feed pipe having orifices in said pipe above the horizontal center of the pipe within the boiler at the desired point for delivery of the water, a pipe secured to and extending beyond said pipe, the water-feed pipe opening into said last-mentioned pipe at or near its upper end, said last-mentioned pipe extending below the adjacent section of the water-feed pipe, and a normally-closed discharge pipe opening from said extension-pipe at or near its lower end, and a valve upon the discharge-pipe adapted when operated to open said pipe.

5. In a boiler, a water-feed pipe having orifices in said pipe within the boiler at the desired point for delivery of the water, an extension-pipe of larger diameter than the water-feed pipe and extending below the adjacent section of the water-feed pipe into which said feed-pipe opens, the discharge from said extension-pipe being normally closed.

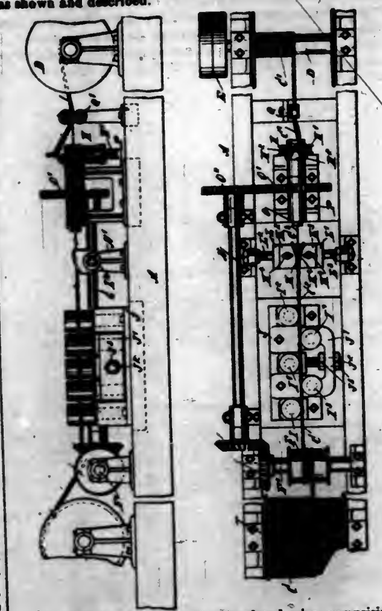
6. In a boiler, a water-feed pipe having orifices in said pipe above the horizontal center of the pipe within the boiler at the desired point for delivery of the water, an extension-pipe of larger diameter than the water-feed pipe into which said feed-pipe opens, said extension-pipe extending below the adjacent section of the water-feed pipe, the discharge from said extension-pipe being normally closed.

7. In a boiler, a water-feed pipe having orifices in said pipe within the boiler at the desired point for delivery of the water, an extension-pipe of larger diameter than the water-feed pipe into which said feed-pipe opens, the said extension-pipe extending below the adjacent section of said water-feed pipe, the discharge from said extension-pipe being normally closed, a valve controlling the discharge from said extension-pipe and adapted when operated to open said pipe.

8. In a boiler, a water-feed pipe having orifices in said pipe above the horizontal center of the pipe within the boiler at the desired point for delivery of the water, an extension-pipe of larger diameter than the water-feed pipe into which said feed-pipe opens, said extension-pipe extending below the adjacent section of said water-feed pipe, the discharge from said extension-pipe being normally closed, a valve controlling the discharge from said extension-pipe and adapted when operated to open said pipe.

9. In a boiler, a water-feed pipe having orifices in said pipe within the boiler at the desired point for delivery of the water, an extension-pipe of larger diameter than the water-feed pipe into which said feed-pipe opens at or near its upper end, said extension-pipe extending below the adjacent section of the water-feed pipe, the discharge from said extension-pipe being normally closed.

10. In a boiler, a water-feed pipe having orifices in said pipe above the horizontal center of the pipe within the boiler at the desired point for delivery of the water, an extension-pipe of larger diameter than the water-feed pipe into which said feed-pipe opens at or near its upper end, said extension-pipe extending below the adjacent section of the water-feed pipe, the discharge from said extension-pipe being normally closed.



11. In a boiler, a water-feed pipe having orifices in said pipe within the boiler at the desired points for delivery of the water, an extension-pipe of larger diameter than the water-feed pipe into which said feed-pipe opens at or near its upper end, said extension-pipe extending below the adjacent section of said water-feed pipe, the discharge-pipe normally closed connecting with said extension-pipe at or near its lower end.

601,694. MACHINE FOR RESTORING INSULATED WIRE. NELSON WILSON, Portland, Oreg., assignor of one-third to Charles Nolen, same place. Filed Aug. 20, 1897. Serial No. 648,929. (No model.)

Claim.—1. A machine for restoring insulated wire, provided with a straightening device for straightening the old insulated wire, and a stripping device in advance of the said straightening device for removing the insulation from the wire, substantially as shown and described.

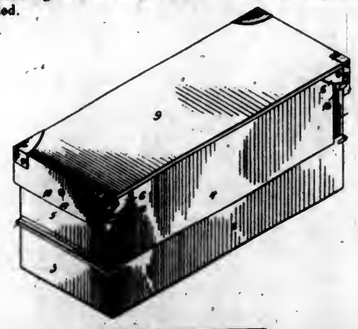
2. A machine for restoring insulated wire, comprising a winding-up device, for winding the straightened and new insulated wire, and imparting a traveling motion to the wire under treatment, a straightening device for straightening the old, insulated wire, a stripping device for removing the insulation from the wire, and a covering or wrapping device for winding new insulating fabric upon the stripped and straightened wire previous to winding up the new wire on the said winding device for winding up the finished wire, substantially as shown and described.

3. A machine for restoring insulated wire, comprising a straightening device for straightening the injured insulated wire, a stripping device forward of the said straightening device, for removing the old insulation from the straightened wire, and a covering or wrapping device in advance of the said stripping device, for placing a new insulating material on the straightened and stripped wire, substantially as shown and described.

4. A machine for restoring insulated wire, comprising sets of rolls between which the injured insulated wire passes to straighten the same, a pair of knives between which the straightened wire passes, to remove the old insulation therefrom, an arbor through which travels the stripped, straightened wire, and a spool-carrier on the said revoluble arbor, for winding a new insulating material upon the said wire, substantially as shown and described.

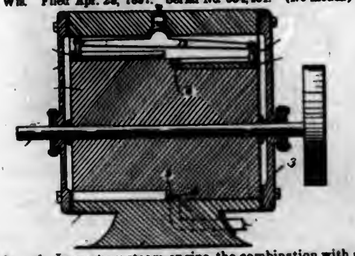
5. A machine for restoring insulated wire, comprising sets of rolls between which the injured insulated wire passes to straighten the same, a pair of knives between which the straightened wire passes, to remove the old insulation therefrom, an arbor though which travels the stripped, straightened wire, a spool-carrier on the said revoluble arbor, for winding a new insulated material upon the said wire, means for imparting a traveling motion to the wire, to pass the same through the said rolls, the knives and the arbor, and a drum driven from the said traveling wire, and connected with the said carrier, to rotate the same, substantially as shown and described.

6. A machine for restoring insulated wire, provided with a pair of knives having curved cutting edges between which passes the wire, the knives being laterally adjustable, substantially as shown and described.



7. A machine for restoring insulated wire, provided with a pair of knives having curved cutting edges between which passes the wire, the knives being laterally adjustable, and means for setting the knives at a desired angle at their cutting edges relatively to the wire passing between the knives, substantially as shown and described.

601,695. SHIPPING CRATE OR CASE. EDGAR A. WOLFE and PETER E HART, Salt Lake City, Utah. Filed Apr. 28, 1897. Serial No. 634,940. (No model.)



Claim.—1. A shipping-crate of two-part construction, one part consisting of a bottom, and side and end walls hingedly connected to the bottom to fold inwardly and occupy positions approximately parallel with the bottom, and said end walls and the ends of the bottom being provided with duplicate exterior projecting ribs arranged transversely parallel with the bottom, and the other part consisting of a top or cover, separable from the first-named part, and provided with fixed depending end flanges provided in their inner surfaces with grooves to receive the ribs and form an interlocking connection between the members of the crate, substantially as specified.

2. A shipping-crate comprising a body portion having a bottom provided with upstanding side and end flanges forming a receptacle, and side and end walls hingedly connected respectively to the side and end flanges of the bottom and adapted to fold inwardly over said receptacle to occupy positions approximately parallel with the bot-

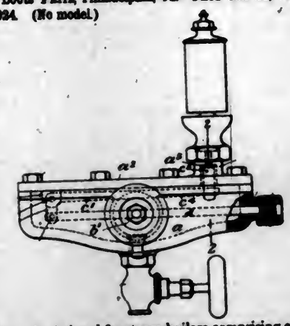
tom, said end walls and the end flanges of the bottom being provided with duplicate outwardly-extending guide-ribs arranged parallel with the bottom; and a separate top or cover provided with fixed depending end flanges having their inner surfaces grooved to receive said guide-ribs, in combination with a transverse partition removably fitted at its side edges in vertical grooves in the side walls, substantially as specified.

601,696. ROTARY STEAM-ENGINE. ANTON ZWIEBEL, Burlington, Wis. Filed Apr. 29, 1897. Serial No. 634,401. (No model.)

Claim.—1. In a rotary steam-engine, the combination with a cylinder provided with inlet and exhaust ports, of a rotary piston arranged within said cylinder and provided at its ends on opposite sides with semicircular recesses, one of the end walls of each recess being provided with an impacting-shoulder and the other with an actuating-shoulder, and the side wall of each recess being provided with transverse apertures communicating with vertical apertures arranged to come opposite the inlet-ports of the cylinder, the vertical apertures of one set being in line with the vertical apertures of the other set, and impacting-heads secured to said cylinder and adapted to successively engage the recesses of the piston, substantially as set forth.

2. In a rotary steam-engine, the combination with a cylinder provided with inlet and exhaust ports, of a rotary piston arranged within said cylinder and provided at its ends on opposite sides with semicircular recesses, one of the end walls of each recess being provided with an impacting shoulder and the other with an actuating-shoulder, and the side wall of each recess being provided with transverse apertures communicating with vertical apertures arranged to come opposite the inlet-ports of the cylinder, the vertical apertures of one set being in line with the vertical apertures of the other set, impacting-heads secured to said cylinder and adapted to successively engage the recesses of the piston, and a connection between the impacting heads, whereby when one head is elevated by the operating-shoulder, the other head will be depressed or lowered into its recess in the piston, substantially as set forth.

601,697. TREE-PROP BRACKET. AMOS B. AMENT and MARCELLUS H. EVANS, Riverside, Cal. Filed Apr. 24, 1897. Serial No. 633,731. (No model.)



Claim.—A tree-prop bracket comprising the plate 1 provided with the approximately rectangular orifice 2 the converging ears 4 4 and semicircular edge 5 the lateral projecting teeth 12 12, and the integral convex-faced arm 9, substantially as shown and described.

601,698. BOTTLE-STOPPER. ALEXANDER BACKHAUS, Königsberg, Germany. Filed Dec. 30, 1897. Serial No. 664,654. (No model.)

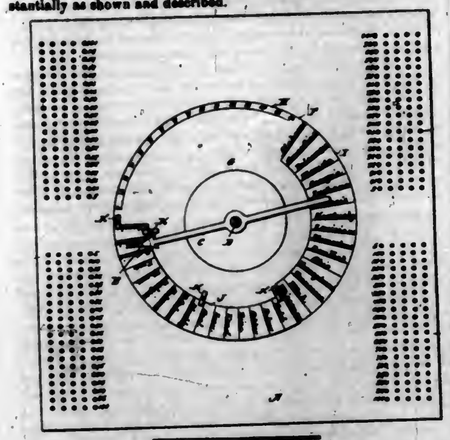
Claim.—The combination with a receptacle having a shoulder around its opening, and an elastic stopping-cap provided with an inwardly-thickened edge to catch under said shoulder, of a depression formed in said shoulder and extended projections so arranged on the portion of the receptacle adjacent to its shoulder that a channel is formed for establishing communication between said depression and the atmosphere, substantially as and for the purpose stated.

601,699. SIGNAL FOR STEAM-BOILERS. HENRY BECHTEL and LOUIS FRITZ, Philadelphia, Pa. Filed Oct. 21, 1897. Serial No. 656,224. (No model.)

Claim.—1. A signal for steam-boilers comprising a casing in communication with the boiler, a valve-seat formed with said casing, a whistle attached to said valve-seat, a right-angular lever located inside the casing and hinged to a projection thereof, a horizontally-disposed expansion-rod located inside the casing and having one of its ends secured to the said casing and the other to one arm of the said lever, and a valve-stem fitting the said valve-seat and being connected to the other arm of the said lever, substantially as and for the purposes set forth.

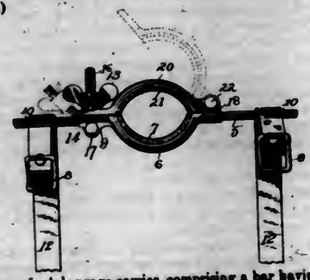
2. A signal for steam-boilers comprising a casing in communication with the boiler, a valve-seat and a whistle connected with said casing, a right-angular lever located inside the casing and hinged to a projection thereof, a horizontally-disposed expansion-rod located inside the casing and having one of its ends adjustably secured to the said casing and the other to one arm of the said lever, and a valve-stem fitting the said valve-seat and being connected to the other arm of the said lever, substantially as and for the purposes set forth.

3. In a signal for steam-boilers, the combination with a casing, a valve-seat, a valve-stem, a lever and a horizontally-disposed expansion-rod located within said casing and having one end pivoted to said lever and the other end threaded and protruding from the said casing, of means for adjusting the said rod and valve-stem, comprising a nipple on said casing, a nut on said threaded end of the expansion-rod, and a jam-nut screwing over the said nipple, substantially as and for the purposes set forth.



601,700. GAME APPARATUS. THOMAS BIRCH, Noblesville, Ind. Filed May 11, 1897. Serial No. 636,060. (No model.)

Claim.—1. A game apparatus, consisting of a base-board, a pointer pivoted to the center thereof so as to freely revolve, a circle formed around the center of said pointer, a series of numbers located within this circle, the names of certain States of the Union also located within the circle, and a segment having a number of names or designating terms thereon adapted to be detached from the board, as specified.

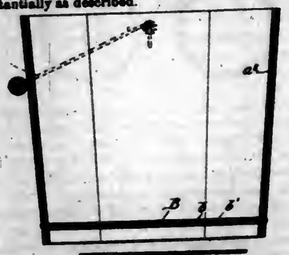


2. A game apparatus, consisting of a base-board having four series of holes formed therein for the reception of score-pins, a circle inscribed upon said board, a block located at the center of the circle, a pointer pivoted upon the block, a series of numbers located within the circle, the names of certain States of the Union located within the circle, and a segment having names thereon detachably secured to the board, as specified.

3. The herein-described combination of a base-board having four series of holes therein for the reception of score-pins, a block secured at the center of the board, a circle formed concentric with this block,

a pointer pivoted upon the block, a band inscribed within the circle and divided into spaces, each of which is numbered, a band I also inscribed within the circle and having the names of certain States of the Union thereon, a segment having certain names thereon, and turn-buttons for securing this segment in place relative to the circle, substantially as shown and described.

601,701. BICYCLE LUGGAGE-CARRIER. CHARLES J. BROWN, Long Island City, N. Y. Filed Jan. 14, 1897. Serial No. 619,274. (No model.)



Claim.—1. A luggage-carrier comprising a bar having an arch intermediate its ends, slots in the bar adjacent one end of the arch, through said slots, a slot in the bar adjacent one end of the arch, an ear at each side of the slot, a bolt passed through the last-named slot and pivoted to the ears, an ear on the bar adjacent the opposite end of the arch and a second arch pivotally connected at one end with the last-named ear, and having a slotted extension at its opposite end adapted to receive in its slot the said bolt, and a clamping-nut upon the bolt adapted to draw the arches toward each other.

2. In a luggage-carrier, the combination with a bar having an arch intermediate its ends and slots in the bar adjacent its ends, of straps passed through said slots, a slot in the bar adjacent one end of the arch, an ear at each side of the slot at the base of the arch, a bolt passed through the last-named slot, a pivot passed through said bolt and engaging the said ears, an ear on the opposite side of the bar from the first-named ear and adjacent the opposite end of the arch, a second arch pivotally connected at one end with the last-named ear, and having a slotted extension at its opposite end adapted to receive the said bolt, a clamping-nut upon the bolt adapted to draw the arches toward each other and yieldable linings for the arches.

601,702. PAIL, &c. ANDREW BURGLAND, Chicago, Ill., assignor to Ellen Burgland, same place. Filed May 22, 1897. Serial No. 637,648. (No model.)

Claim.—1. As an article of manufacture, a hoopless pail composed of a series of layers of wood each layer consisting of a series of upright staves arranged edge to edge the joints of the respective layers breaking with those of the companion layer and the various layers being glued or cemented together, and a fixedly-secured bottom, substantially as described.

2. A hoopless wooden pail composed of a body portion made up of a plurality of layers each layer consisting of a series of staves arranged edge to edge the joints of one layer breaking with those of the other layers, the various layers being glued or cemented together, a bottom, and suitable fastening devices spanning the joints of the outer layer projecting through the layers and entering the bottom, substantially as described.

601,708. ARTIFICIAL DENTURE. EDWARD L. CHAFFIN, Helena, Ark. Filed June 26, 1897. Serial No. 642,494. (No model.)

Claim.—1. An improved artificial denture, comprising an anchor-bar fixedly joined to the natural teeth and an artificial tooth-carrying saddle, detachably secured to the said bar, as set forth.

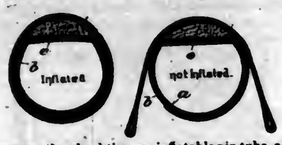
2. The combination with the anchor, teeth having cavities formed in the palato-approximal portion thereof, cut flush with the gum margin, and the anchor-bar having its ends fixedly secured in such cavities, of an artificial tooth-holding body having a clasp portion to fit the said bar as specified.

3. As an improvement in artificial denture, the combination with the anchor-bar fixedly held to a pair of the natural teeth, of a saddle member adapted to slip over the bar, said saddle having a spring-clasp portion whereby to tightly engage the anchor-bar, and the artificial tooth or shells secured to such saddle as set forth.

601,704. MACHINE FOR CUTTING TREAD-FILLING STRIPS FOR WHEEL-TIRES. GEORGE H. CLARK, Boston, Mass. Filed July 28, 1897. Serial No. 646,223. (No model.)

Claim.—1. In a machine for cutting segmental strips, the combination of a rotating crown-knife, a work-rest in front of and projecting into it a short distance only, and made of a width to closely fit within said knife, an edge guide located in front of and close to said knife, and a top guide for the strip located above the knife, substantially as described.

2. In a machine for cutting segmental strips, the combination of a hollow rotatable shaft having a crown-knife at one end, a work-rest in front of and projecting into said knife a short distance only, and made of a width to closely fit within said knife, an edge guide located in front of and close to said knife having a portion which projects laterally over said work-rest, and which serves as a top guide, and means for adjusting said edge guide whereby said top guide may occupy different elevations above the knife, substantially as described.



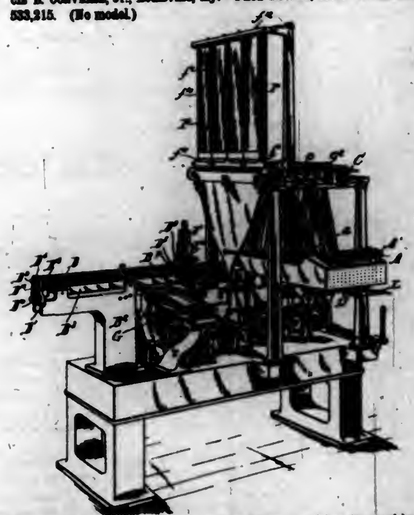
3. In a machine for cutting tread-filling strips for wheel-tires, the combination of a rotating crown-knife, and a work-rest in front of and projecting into it, and made of a width to closely fit within said knife, and an adjustable edge and top guide secured to one side of said work-rest close to said knife, substantially as described.

4. In a machine for cutting tread-filling strips for wheel-tires, the combination of a rotating crown-knife, and a work-rest in front of and projecting into it, and made of a width to closely fit within said knife, and an edge and top guide for the strip said top guide located above said work-rest and above the knife, substantially as described.

601,705. PNEUMATIC WHEEL-TIRE. GEORGE H. CLARK, Boston, Mass. Filed Sept. 21, 1897. Serial No. 652,454. (No model.)

Claim.—1. A pneumatic wheel-tire comprising an inflatable air-tube, an expansive sheath of fabric containing it, and a non-extensible circular protecting-strip, segmental in cross-section, at the tread

side of said sheathed tube, all of said parts being vulcanized together and producing, when inflated, an egg-shaped tire, substantially as described.



2. In a pneumatic wheel-tire, an inflatable air-tube, an expansive sheath containing it, a non-extensible circular protecting-strip at the tread side of said sheathed tube, comprising essentially a circular strip of cork, segmental in cross-section, and composed of two or more cork strips scarfed at the ends and secured together, and an outer covering for the tire, substantially as described.

3. A pneumatic wheel-tire comprising an inflatable air-tube, contained within an expansive sheath, a non-extensible protecting-strip at the tread side of said sheathed tube, composed of a circular strip of cork, segmental in cross-section and a non-extensible strip of fabric secured thereto, all of said parts being vulcanized together, substantially as described.

4. A protecting-strip for pneumatic wheel-tires consisting of a circular strip of cork, segmental in cross-section, and composed of two or more cork strips scarfed at the ends and secured together, and a non-expansive strip of fabric secured to said segmental strip, substantially as described.

601,706. TYPE SETTING AND JUSTIFYING MACHINE. FRANCIS R. CONVERSE, Jr., Louisville, Ky. Filed Dec. 30, 1894. Serial No. 533,215. (No model.)

Claim.—1. In a type setting and justifying machine, in combination, a line-holder, temporary spreading spacing devices adapted to be inserted between types as they are composed therein, mechanism for inserting said devices in the line, retarding mechanism connecting said inserting mechanism with a controlling-key whereby all actuation of the key causes the operation of the inserting mechanism after the lapse of a predetermined interval of time and whereby a second impulse of the key before the completion of the insertion of the first spacing device will be communicated to the inserting mechanism and cause the insertion of a second spacing device, for the purpose specified.

2. In a type-setting mechanism, in combination, a set of operating-keys, a set of type-cases, mechanism controlled by said keys for ejecting types from said cases, converging chutes leading from the points of ejection to a common point, each of said chutes having a roller at its upper end against which the foot end of the ejected type falls, for the purpose specified.

3. In a type-setting mechanism, in combination, a set of finger-keys, a set of type-cases, a set of bars capable of ejecting types from their cases, said bars having teeth upon their upper and under sides and being movable longitudinally and having some part thereof capable of being raised by a movement other than its longitudinal movement into connection with a revolving gear-cylinder above said bars and extending across them, mechanism operated by said finger-keys for so raising said ejector-bars into connection with said cylinder whereby said ejector-bars are moved to eject types from their corresponding cases, a second gear-cylinder below said bars and extending across them, and means whereby said ejector-bars automatically drop into connection with said latter cylinder when they reach the forward end of their stroke whereby they are returned to their original positions, substantially as and for the purposes specified.

4. In a type-setting mechanism, in combination, a set of finger-keys, a set of corresponding type-cases, a set of bars capable of longitudinal movement for ejecting types from their cases, a revolving member extending across said bars above the same and one extending across the bars below them, said bars having some portion thereof capable of a movement other than their longitudinal movement whereby they may be raised into connection with said upper revolving member, raising-fingers located beneath said bars, mechanism connecting said raising-fingers with the finger-keys whereby an actuation of a finger-key causes its corresponding raising-finger to raise an ejector-bar into connection with the upper revolving member and hold it there until it has completed its forward stroke, a notch on the under side of each ejector-bar so situated that it comes over the raising-finger when the bar has ejected its type from its case, said notch being of such dimensions that when it comes over the raising-finger the ejector-bar drops out of connection with the upper revolving member and into connection with the lower revolving member whereby the ejector-bar is returned to its original position, and means for releasing the connection between the lower revolving member and the said ejector-bar when the latter shall have returned to its said original position, substantially as and for the purpose specified.

5. In a type-setting mechanism, the combination of a finger-key, a pivoted raising-finger, an ejector-bar having a raisable portion above said raising-finger, a revolving member above said bar, mechanism connecting said raising-finger with a finger-key whereby a depression of the finger-key causes the operative end of the raising-finger to raise its corresponding ejector-bar into connection with the said revolving member, the perpendicular distance between the pivot of the raising-finger and its corresponding ejector-bar when elevated bearing such proportion to the length of the raising-finger between its pivot and its operative end that when the raising-finger raises the ejector-bar into contact with the revolving member the raising finger will be in a position near enough vertical to remain elevated and hold the ejector-bar in contact with the revolving member after the depressing force is removed from the finger-key, for the purpose specified.

6. In a type-setting mechanism, the ejector-bar *d*, formed with an oscillatable tail *d'*, said tail having gear-teeth upon its upper and lower sides, in combination with the toothed revolving members *e* and *e'*, substantially as described.

7. In a type-setting mechanism, in combination, a set of finger-keys, a corresponding set of type-cases, there being one type-case for each finger-key and one or more additional type-cases for some of the keys of the most commonly used characters, an ejector-bar for each type-case adapted to eject types therefrom, mechanism connecting the finger-keys with corresponding ejector-bars whereby a depression of a key causes the ejection of its corresponding type, and a set of individual shifting mechanisms each corresponding to a character of which there are additional type-cases and each operating to independently shift the mechanism connecting a key of a character to which there corresponds more than one type-case with the ejector-bars for said cases, whereby one key may operate to cause the ejection of types from one type-case until they are exhausted and then its connecting mechanism may be shifted and it may cause the ejection of types from another type-case, for the purpose specified.

8. In a type-setting mechanism, in combination, a set of ejector-bars having raisable portions, a corresponding set of raising-fingers, each operating upon the raisable portion of its corresponding ejector-bar, a shifting rod operating to change the relative position existing between a raising-finger and the ejector-bar whereby said raising-finger may operate successively upon more than one ejector-bar, for the purpose specified.

9. In a type-setting mechanism, in combination, a set of finger-keys, a set of rocking shafts connected therewith, a set of raising-fingers actuated by said rocking shafts, said raising-fingers being loosely journaled upon a shaft and being operative upon the raisable portions of a set of ejector-bars, and one or more shifting rods whereby one or more of said raising-fingers may be made to successively operate upon more than one of said ejector-bars, for the purpose specified.

10. In a type-setting mechanism, a type-case from off the bottom of which types may be ejected singly in a path which is substantially a straight prolongation of the position occupied by the bottom type in the case, said bottom being formed substantially as described and having some portion which is out of contact with the lowest type when the same lies flatly on the bottom of the case, whereby the types are prevented from descending askew, for the purpose specified.

11. In a type-setting mechanism, a type-case from off the bottom of which types may be ejected singly in substantially the same horizontal plane in which the bottom type lies, said bottom being made with a depression therein, whereby the types are prevented from coming down askew and are allowed to descend evenly, substantially as described and for the purpose specified.

12. In a type-setting mechanism, a type-case from off the bottom of which types may be ejected singly, the forward part of said bottom having a groove therein, said groove being located far enough back from the front edge of the bottom so that there is a portion of the said bottom forming a wall in front of the groove, said groove operating to insure the descension of the type evenly, whereby the sticking of the lowest type in a position where the ejector-bar cannot eject it is prevented, in combination with an ejector-bar adapted to enter the type-case from behind and above the lowest type therefrom, substantially as described.

13. In a type-setting mechanism, a bank of type-cases having rigid sides, back and partitions and a removable end, said end being held in place by a pin passing through each side of the case and into said end and held therein by a spring to which it is attached, in combination with mechanism operating upon the spring and adapted to withdraw the pin from the said end and hold it out of contact therewith, whereby the said end may be removed, substantially as described.

14. In a type-setting mechanism, the bank of type-cases P having the removable end *b*, in combination with the spring b^3 and pin *b* projecting from said spring through a hole in the side of the bank and into a hole in the end *b*, and the wedge-faced bar b^4 adapted to come under the said spring b^3, substantially as described and for the purpose specified.

15. In a type-setting mechanism, a bank of type-cases held in a substantially vertical position and being capable of being removed from its supports by first being tipped backward at its upper end, in combination with a front hinged at its lower end and capable of backward movement at its upper end, and a stop to limit said backward movement, substantially as described.

16. In a type-setting mechanism, the chute-plate g^{13}, constructed with channels therein, said channels being so disposed that they from chutes leading from the various points near the top of said chute-plate to a common point near the bottom thereof, in combination with a ledge *g* hinged to the top of said chute-plate, guides *g'* secured to said ledge, the spaces between said guides forming continuations of the channels in the chute-plate, and the piece g^{11} secured to said guides, substantially as described.

17. In a type-setting mechanism, in combination, type-cases, from which types are ejected singly, a ledge to receive and support the face end of a type so ejected, guides between which said type is free to fall and a roller so placed and revolved as to receive the falling end of said type and assist the downward movement thereof, for the purpose specified.

18. In a type-setting mechanism, chutes converging into a common channel through which types may fall, in combination with a wheel placed tangentially to the line of travel of types through said common channel, said wheel being on an axis capable of translation in such manner that the distance between the circumference of the wheel and the opposite wall of the channel may be varied, for the purpose specified.

19. In a type-setting mechanism, in combination, the wheel *h*, the oscillatable support h^2 carrying the same, and the gears h^3 and h^4—the axis of rotation of said gear h^4 being substantially the same as the axis of oscillation of said support h^2, substantially as and for the purpose specified.

20. In a type-setting mechanism, in combination with a channel down which types may fall, the yielding wheel *h*, and the advancing wheel *h'*, said wheels being so placed that a type passing down said channel may come into contact with the wheel *h'* before leaving the wheel *h*, substantially as and for the purpose specified.

21. In a type-setting mechanism, in combination, the wheel *h*, the shaft h^6, the gears h^7 and h^8, the gears h^9 and h^{10}, the shaft h^{11}, and the wheel *h'*, substantially as described.

22. In a type-setting mechanism, a movable line-holder having a flange thereon against which a type may be set up, in combination with a revolving wiper-wheel having a plurality of arms whereby one of said arms is adapted to receive the foot end of a type descending from above and lower the type while the following arm advances the type and thereby moves the line-holder forward a distance equal to the thickness of said type, for the purpose specified.

23. In a type-setting mechanism, in combination, a traveling line-holder, a bar capable of a limited movement with the line-holder, means whereby said bar is connected with the line-holder and moved with it a certain predetermined distance and then passes out of moving connection with said line-holder and is held stationary until said line holder has moved a predetermined additional distance when said bar is released, a spring serving to retract said bar when released and means whereby the retraction of said bar causes a signal to be given indicating that the line-holder has reached a certain predetermined point, for the purpose specified.

24. In a type-setting mechanism, a traveling line-holder *i* in combination with a bar *z* capable of a limited longitudinal movement, projections z^2 and *z'* upon said bar, a supporting-surface for said bar having a depression z^3 therein, a spring z^4 tending to retract said bar, a hammer z^5 arranged to strike a gong z^6 when said bar is retracted, substantially as described.

25. In a mechanism for justifying a line of type, in combination, one or more line-holders adapted to receive and hold a line of type and spacing devices, and to be moved successively to a position where it is filled with type and spacing devices, to a position where space-blanks are substituted for the spacing devices, to a position where the line of type is delivered from the line-holder, and thence again to the first position mentioned; means whereby said line-holder is automatically carried to these successive positions: one or more spacing devices independent of said line-holder, capable of being inserted between types in the line-holder and of being withdrawn from the line-holder and returned to the position from which they were inserted into the line; and means for inserting such spacing devices, for withdrawing them and for returning them to the position from which they were inserted in the line, for the purpose specified.

26. In a mechanism for justifying a line of type, in combination with two or more traveling line-holders, a series of independent wedges supported in position to be inserted between types in the line of one of said line-holders, mechanism for inserting the same, mechanism for withdrawing said wedges and supporting them independent of said line-holder, and means for returning them to position for insertion between the types of a succeeding line-holder, for the purpose specified.

27. In a justifying mechanism, the combination of a traveling line-holder, wedges interposed between the words thereon and carried therewith, said wedges having eyes adapted to receive a guide, mechanism for withdrawing said wedges, a guide adapted to engage with said eyes, and means for propelling said wedges along said guide, for the purpose described.

28. The combination of a reciprocating mechanism adapted to support a line-holder; a space-magazine having discharge-orifices; a line-holder adapted to receive and contain and support a line of types and wedges; a bumper toward which the reciprocating mechanism moves and against which the wedges impinge; and mechanism affording sufficient retrograde movement of the line-holder to cause the line of type to register with one of the orifices of the space-magazine, for the purpose specified.

29. In a justifying mechanism, the combination of a traveling line-holder, a reciprocating platform capable of supporting said line-holder, a rack and pawl serving to sustain the platform temporarily against return movement, for the purpose specified.

30. In a justifying mechanism, the combination of a traveling line-holder carrying types and temporary spacing devices, means for moving the same crosswise of the line, a rack and pawl serving to sustain the same temporarily against return movement, said rack having notches corresponding with the orifices of a space-magazine, for the purpose described.

31. In a justifying mechanism, in combination, a reciprocating platform, means for supporting thereon a line of types and spacing devices, a detent serving to sustain the platform temporarily against return movement, mechanism for removing the spacing devices from the line, and mechanism for throwing said detent out of action after the last spacing device has been removed, for the purpose specified.

32. In a justifying mechanism, a traveling line-holder adapted to carry a line of type upon its upper side, in combination with a reciprocating bar beneath said line-holder, said bar carrying a trip adapted to engage with said line-holder whereby an advancement of the bar advances the line-holder while a retraction of the bar does not retract the line-holder, substantially as specified.

33. In a type-justifying mechanism, in combination, a line-holder, spacing-wedges between types in a line contained therein, a bumper adapted to drive in said wedges and having its bumping-face at an angle to the line of type, said angle being unchanged during the operation of bumping, whereby wedges near one end of the line are driven farther in than wedges near the other end, for the purpose specified.

34. In a justifying mechanism, in combination, a line-holder, temporary spreading spacing devices between types in a line contained therein, means for causing said devices to increase the line-spaces, means for substituting space-blanks for the spacing devices, and means for preventing this substitution when the increase of line-space is more than or less than a predetermined amount, respectively, for the purpose specified.

35. In a type-justifying mechanism, in combination, a line-holder,

temporary spacing devices between types in a line contained therein and adapted to spread the line by being moved through it, means for moving said devices through the line, means for advancing the line-holder which are thrown into operation only when the wedges have been advanced more than a predetermined minimum and less than a predetermined maximum, for the purpose specified.

36. In a type-justifying mechanism, a series of wedges and mechanism for inserting the same thin end foremost in a direction transverse to the length of a type into a line of type being assembled, in combination with a wiper-wheel adapted to force forward the line set up, and means for diverting the point of a wedge being inserted from the arms of the wiper-wheel while permitting the insertion of the thin end of the wedge between the wiper-wheel and the type, for the purpose specified.

37. In a justifying mechanism, a wedge less in height than the types with which it is to be used, and having a notch near its large end, substantially as described.

38. In a justifying mechanism, a wedge less in height than the types with which it is to be used, and having an eye through it, substantially as described.

39. In a justifying mechanism, a wedge less in height than the types with which it is to be used and having an eye through it and a notch near the large end thereof, substantially as described.

40. In a justifying mechanism, a wedge having a straight extension at each end thereof, and having a notch in the larger of said extensions, substantially as described.

41. In a justifying mechanism, a wedge having a straight extension at each end thereof, and having an eye through the larger one of said extensions, substantially as described.

42. In a justifying mechanism, a wedge having an extension at each end thereof, and having an eye through, and a notch in, the larger one of said extensions, substantially as described.

43. In a justifying mechanism, a traveling line-holder having recessed flanges at the ends thereof and a rabbeted edge, substantially as described.

44. In a justifying mechanism, a traveling line-holder having recessed flanges at the ends thereof, and having feet on the under side thereof, substantially as described.

45. In a justifying mechanism, a traveling line-holder adapted to carry a line of type and wedges interposed therein and engaging therewith, said wedges being adapted to be moved across the line-holder through the line, said line-holder having a surface adapted to stand under the center of gravity of said wedges when resting in any engaging position upon the same, whereby gravity holds said wedges in place, for the purpose specified.

46. In a justifying mechanism having a series of space-blanks and wedges tapering to correspond therewith, a line-holder having a rabbet along its front edge, and adapted to carry a line of type thereon, and having extending from said rabbet a plain surface at least as many times greater than the width of the rabbet as there are different-sized space-blanks whereby the wedges corresponding to said space-blanks may be supported by said surface, substantially as and for the purpose specified.

47. In a justifying mechanism, the combination with a space-magazine adapted to hold a graduated series of space-blanks in order across the same, and a series of wedges tapering to correspond therewith, of a line-holder adapted to support a line of type, and having a surface extending back of said line a distance at least as great as the internal width of said space-magazine, and thereby adapted to support said wedges and permit the same to rest by gravity upon said surface, substantially as and for the purpose specified.

48. In a justifying mechanism, a traveling line-holder i, having the recessed flange i^3 at each end thereof, having the rabbeted edge i^6, and having the feet i^5 and i^8, substantially as described.

49. In a justifying mechanism, the wedge-withdrawing device consisting of the block w^4 having the flange w^7, the pawl w^8, and the lever w^9, substantially as described.

50. In a justifying mechanism, the wedge-withdrawing mechanism, consisting of the block w^4, the guide w^5, the pawl w^{13}, and the rod j', substantially as described.

51. In a justifying mechanism, the combination with a wedge having an eye through it, of the rod j' and the sliding block j^5 carrying the trip j^6, substantially as described.

52. In a justifying mechanism, in combination with a space-magazine, the space-plungers F, the cross-head F^6 carrying the block F^9 to engage said plungers, substantially in the manner described.

53. In combination with the space-magazine of a type-justifying mechanism, the plunger-frame F, the plungers F' having lugs F^7, the cross-head F^6 slidable longitudinally on said frame, the block F^9 slidable transversely in said cross-head and operating to engage one of said lugs F^7, substantially as described.

54. In a justifying mechanism, in combination, the space-magazine, the vertically-movable cross-head F^6 carrying the sliding block F^9, said block being so connected with the platform that, while having an independent vertical movement, it partakes of the transverse movement of said platform, substantially in the manner described.

55. In a justifying mechanism, in combination with the platform p, the rack R, the pawl R', the catch R^2, substantially as described.

56. In a justifying mechanism, in combination with the platform p, the rack R, the pawl R', having the arm R^3, and the leg R^4, substantially as described.

57. In a justifying mechanism, in combination, the bumper m', the platform p, movable toward said bumper, for the purpose specified.

58. In a justifying mechanism, in combination, the bumper m', the platform p, the rack R, and the pawl R', substantially as described.

59. In a justifying mechanism, in combination with the movable bumper m, the raising-bar x partaking of the motion of said movable bumper, the rod x^6, the lever x^7, the shaft x^4 and the detent x^5, substantially as described.

60. In a justifying mechanism, in combination with the space-magazine, the framework D carrying the slats D^2 upon which are hung the followers D^7, said followers being pulled forward by cords to which weights are attached, substantially in the manner described.

61. In a justifying mechanism, the platform p, the springs p^{11} and p^{12} suitably connected with the platform and tending to move it in opposite directions, one of the said springs being stronger than the other, in combination with mechanism adapted to counteract the force of the stronger spring whereby the platform is moved by the weaker spring in the direction of its tendency, for the purpose described.

62. In a justifying mechanism, in combination, the platform p, the lever p^{10} connected therewith loosely whereby it may move the platform in one direction but not in the other, means acting upon said lever and tending to pull the platform forward, weaker means tending to pull the platform rearward, and a cam operating to move said lever in the direction to overcome its pull upon the platform whereby the latter is moved by the weaker means, for the purpose specified.

63. In a justifying mechanism, in combination, the platform p, the lever p^7 connected therewith, the spring p^{11} acting through said lever and urging the platform rearward, the lever p^{14}, and the spring p^{12} acting upon the latter lever and urging the platform forward, substantially as described.

64. In a justifying mechanism, in combination, the guide j^3, the block j^4 slidable along the same, the lever j^{10} connected with said block, the cam j^{11} forcing said lever in one direction, and the spring j^{12} forcing it in the other direction, substantially as described and for the purpose specified.

65. In a justifying mechanism, the wiper-wheel X, having the substantially conical face X^{16}, substantially as described and for the purpose specified.

66. In a justifying mechanism, a traveling line-holder having recessed ends, a galley, a finger projecting across the width of the galley in such position that as the line-holder advances it will pass through the recesses in the ends thereof and be in a position behind the line of type therein, in combination with mechanism adapted to advance said finger and thereby move the line of type from the line-holder into the galley and then retract said finger back of its original point of rest and thereby carry the line-holder with it, substantially as and for the purpose described.

67. In a justifying mechanism, the finger g^3 extending across the mouth of a galley and adapted to enter behind the line of type carried by a traveling line-holder, the lever g^2 connected with said finger, and the cam g so operating said finger that it moves forward shoving the line of type from the line holder into a galley, and then moves rearward back of its original point of rest and carries the line-holder with it, substantially as described.

68. In a justifying mechanism, a traveling line-holder adapted to support a line of type upon its upper side, said line-holder having feet i^9 adapted to slide in a groove i^{10} in the track i^{16}, in combination with rails i^2 and i^4 adapted to confine the line of type supported upon the upper side of said line-holder, substantially as described.

69. In a justifying mechanism, a line-holder having a recessed flange or wall against which the first type in the line bears, in combination with means for preventing said first type from entering the recess in said wall as it is being inserted in the line-holder, for the purpose specified.

70. In a justifying mechanism, in combination, a traveling line-holder, a track g^{12} along which said line-holder may slide, a revolving screw operating to propel said line-holder along said track, substantially as described.

71. In a type-justifying mechanism, in combination, a line of type, mechanism for inserting spacing devices between types in the line, a lever c^3 operating to throw said mechanism into action, a bar c^6 having a lug c^7 thereon which may be brought into contact with said lever and cause it to operate, means for retracting said lug from engagement with said lever, a revolving shaft c^9, and mechanism actuated when desired causing said bar c^6 to be brought into engagement with said shaft when the lug on the said bar c^7 is out of engagement with said lever c^3, substantially as described.

601,707. RAIL-BOND. JOHN J. DAIRTON, Chicago, Ill. Filed Feb. 15, 1897. Renewed Mar. 9, 1898. Serial No. 673,275. (No model.)

Claim.—1. A rail-bond provided with terminal sleeves entering tapered holes in the rail web or flange from the larger end of the hole and removably expanded therein by tapered drift-pins inserted from the same side as the rail-bond, said drift-pins being longer than the terminal and arranged to project at each end thereof and the end of the terminal being left substantially flush with the face of the rail so as to prevent the expansion of the metal under the action of the drift-pin from forming a bead or head to interfere with the removal of the bond.

2. A rail-bond provided with tapered terminal sleeves entering tapered holes in the rail web or flange from the larger side of the hole and removably expanded therein by tapered drift-pins inserted from the same side as the rail-bond, said terminals being counterbored throughout the portions thereof external to the rail, and the drift-pins being of greater length than the terminals and arranged to project at each end of the latter.

601,708. MAGAZINE-FIREARM. ROBERT DIMMOCK, Passaic, N. J., assignor of three-fourths to Charles B. Dunn and Paul R. Lafferts, same place, and Paul R. Van Mater, Washington, D. C. Filed Mar. 16, 1897. Serial No. 627,280. (No model.)

Claim.—1. In a firearm, the combination with a gun frame, barrel, and stock, of a cartridge-passage communicating between the gun-barrel and the stock, a cartridge-feed mechanism, a reciprocating breech block working within the gun-frame, a locking-block movably secured to the breech-block, and an actuating connection between the cartridge-feed mechanism and the locking-block, arranged to lock the block in place when in firing position, substantially as set forth.

2. In a firearm, the combination, with a gun frame, barrel, and stock, of a cartridge-passage communicating between the gun-barrel and the stock, a cartridge-feed mechanism, a reciprocating breech-block working within the gun-frame, a locking-block movably secured to the breech-block, and a folding connection between the locking-block and the feed mechanism, whereby the block, when moved from its firing position, may be folded down close to the feed mechanism, within the gun-frame, substantially as and for the purpose set forth.

3. In a firearm, the combination with a frame, barrel, stock having a cartridge-passage therein, and a cartridge-passage between the stock and barrel, of a reciprocatory feed-slide for advancing the cartridges from the stock, a reciprocatory breech-block working within the gun frame in rear of the barrel, a locking-block secured to the breech-block and movable out of line with the barrel, to a position within the gun-frame, and a folding connection between the locking-block and the feed-slide, substantially as set forth.

4. In a gun, the combination with a frame, barrel, and stock, of a laterally-disposed passage for the cartridges between the stock and barrel, a feed mechanism provided with means extending into the passage and which act upon the cartridges while within such laterally-disposed passage to advance them through it, a reciprocatory breech-block working within the frame in the rear of the barrel, means for actuating the breech-block, and means for actuating the feed mechanism, substantially as set forth.

5. In a gun, the combination with a frame, barrel, stock, and cartridge chamber or passage within the stock, of a laterally-disposed passage establishing communication between the magazine-chamber and the barrel, a feed-slide provided with means for advancing cartridges through the passage, a reciprocatory breech-block working within the frame in the rear of the barrel, and means for actuating the breech-block connected with the feed-slide, substantially as set forth.

6. In a firearm, the combination with a frame, barrel, stock, and cartridge-passage within the stock and frame communicating with the barrel, of a feed-slide provided with means for advancing cartridges through the passage, a locking-block also provided with means for advancing cartridges through the passage, and means for actuating the locking-block and feed-slide, respectively, substantially as set forth.

7. In a firearm, the combination with a frame, and section of cartridge-passage within the frame, of a breech-block and locking-block movably secured thereto, means upon the locking-block for advancing a cartridge within the passage to a position in front of the breech-block, and mechanism for actuating the locking-block, substantially as set forth.

8. In a firearm, the combination with a frame, stock, and cartridge-passage partially within the frame and partially within the stock, of a feed-slide provided with means for actuating a cartridge through the passage within the stock, a locking-block provided with means for actuating the cartridge through the passage within the frame to a position in front of the breech-block, and means for actuating the feed-slide and locking-block, respectively, substantially as set forth.

9. In a gun, the combination with a frame adapted to be secured at one end to a barrel, and at the other end to a stock, of a movable breech-block within the frame, a locking-block movably secured to the breech-block, means for operating the locking-block, and a connection between said means and the locking-block provided with engaging parts which are brought into supporting contact with the frame at the final closing movement of the parts, substantially as set forth.

10. In a firearm, the combination with a frame adapted to be secured at one end to a barrel, and at the other end to a stock, of a movable breech-block within the frame, a locking-block movably secured to the breech-block, a feed-slide working in the frame, a link pivotally connected at one end to the locking-block, and at the other end to the feed-slide, means of direct contact between the link and the locking-block at one end, and through the feed-slide with the frame at the other, and mechanism adapted to actuate the feed-slide, and to interpose the link vertically between the frame and the locking-block, substantially as set forth.

11. The combination with a gun-frame, an abutment-face on the forward end thereof, of a reciprocatory breech-block within the frame, a locking-block pivotally secured to the breech-block, a fulcrum extension upon the locking-block adapted to bear against the abutment-face upon the frame, to start the breech-block, and means for actuating the locking-block, substantially as set forth.

12. In a firearm, the combination with a reciprocatory breech-block, and mechanism for actuating it, of a firing-pin movable within the breech-block and having an extension which works in a longitudinal groove in the gun-frame, and a stop-shoulder against which said extension strikes for intercepting the rearward movement of the firing-pin, substantially as set forth.

13. In a firearm, the combination with a reciprocatory breech-block, of a spring-hook carried thereby and adapted to engage the heel of a cartridge, a stop located at one side of the path of said block, and a firing-pin movably mounted in said breech-block and extended so as to engage with said stop when the block is drawn backward, substantially as and for the purpose described.

14. In a firearm, the combination with a gun-frame having one of its sides provided with a groove or depression, of a movable locking-block mounted within the gun-frame, means for actuating the block, a spring-actuated plunger within the block having a lateral projection which enters the said groove or depression, a sear also extending within the said groove or depression for engaging with said projection, and a trigger operatively connected with the sear, substantially as set forth.

15. In a firearm, the combination with a breech-block, and a relatively movable firing-pin carried thereby, of a locking-block connected to the breech-block, means for actuating said blocks, a spring-actuated plunger mounted in the locking-block, a sear for engaging said plunger, and a trigger operatively connected to said sear, substantially as described.

16. In a firearm, the combination with a movable breech-block, of a locking-block connected thereto, means for actuating said blocks, a plunger mounted in the locking-block, and provision for holding the plunger back as the locking-block is advanced, substantially as described.

17. In a firearm, the combination with a movable breech-block, of a locking-block connected thereto, means for actuating said blocks, a plunger mounted in the locking-block, and means operative by the trigger for holding and releasing said plunger, substantially as described.

18. In a firearm, the combination with a gun-frame, a movable sear, a movable plunger-containing member, plunger and spring, and means for giving to the plunger-containing element irregular movements, whereby in traveling in one direction it is caused to take one path, and when traveling in the other direction, another path of intermittently-operative connecting mechanism uniting the plunger and sear, whereby the plunger is caught by the sear in its movement in one direction and not in the other, substantially as set forth.

19. In a firearm, the combination with a gun-frame having one of its sides provided with a groove or depression, of a sear extending within such groove or depression, a trigger operatively connected therewith, a movable plunger-containing element mounted within the gun-frame, a plunger and spring within such element, the plunger being provided with a projection which extends into said groove or depression, and is adapted to engage with the sear, and means for giving to the plunger-containing element irregular movements, whereby when it is moved in one direction it is caused to take one path, and when moved in the opposite direction to take another path, substantially as set forth.

20. In a firearm, the combination with a gun-frame, movable sear, and movable element, for example, a locking-block, working within the frame, of a groove in the sear, and in the frame, respectively, and a stud upon the movable element working within the groove in the frame and sear, respectively, substantially as and for the purpose specified.

21. In a firearm, the combination with a gun-frame, and movable sear, provided with a plunger-stud-engaging face, of a movable breech-block within the frame, a locking-block movably secured thereto, a plunger and plunger-spring within the locking-block, and a plunger-stud adapted to engage and ride upon the face of the sear during the movement of the locking-block to the firing position, substantially as set forth.

22 In a firearm, the combination of a gun-frame provided with a groove having a plurality of guiding edges or surfaces, a reciprocatory breech-block, a locking block movably secured thereto, and carrying a projecting stud which extends into the aforesaid groove, whereby when the locking-block is moved in one direction it is directed in one course, and when moved in the opposite direction is directed in a different course, a reciprocatory hand-grip, and connections between the said hand-grip and the said blocks, substantially as set forth.

23. In a firearm, the combination of a gun-frame provided with a groove, a reciprocating breech-block, a locking-block movably secured thereto, and carrying a laterally-projecting stud working in said groove, a reciprocating hand-grip mounted on the barrel, a feed-slide connected thereto, and a link interposed between the feed-slide and locking-block, substantially as described.

24. In a firearm, the combination with a gun-frame provided in its inner wall with a groove, of a movable breech-block, a locking-block connected thereto, locking-block-actuating mechanism, a reciprocatory plunger within the locking-block, and a stud on the plunger working in the groove in the gun-frame, substantially as and for the purpose described.

25. In a firearm, a gun-frame provided in its inner wall with a groove for the sear, in combination with a movable sear mounted therein, a movable breech-block, a locking-block connected thereto, a plunger reciprocating in the locking-block, a stud on the plunger for engagement with the sear, and a trigger having engagement with said sear and adapted to move the latter into and out of the path of the plunger-stud, substantially as described.

26. A breech-loading firearm having one or more cartridge-compartments in its stock, in combination with a longitudinally-extended magazine located at one side of the center of the gun, said magazine converging at its ends toward the gun-barrel and the said cartridge-compartments, respectively, a feed-slide for advancing the cartridges through the magazine, a reciprocating breech-block, a locking-block pivotally connected thereto, and a link connecting said locking-block and feed-slide, substantially as described.

27. In a firearm, a longitudinal magazine deflected to one side, in combination with a feed-slide having parts widened to correspond with the deflected part of the magazine and provided with feeders at intervals in its links and means for actuating the feed-slide, substantially as described.

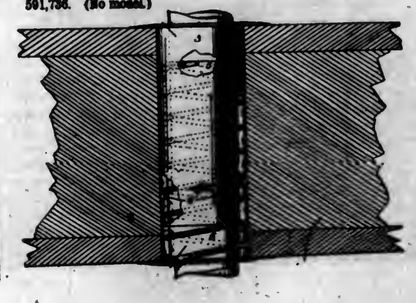
28. In a firearm, a longitudinal magazine deflected to one side in combination with a flexible feed-slide deflected in its length, and having widened parts, spring-feeders at intervals in the length of the feed-slide, and located out of line to correspond with the deflected part of the magazine, and means for actuating the feed-slide, substantially as described.

29. In a firearm, the combination with a laterally-deflected magazine, of a feed-slide provided with feeders located at different intervals, and arranged out of longitudinal alinement corresponding to the lateral curvature of the magazine, substantially as described.

30. In a firearm, the combination with a frame, stock and barrel, of a cartridge-passage within the frame and stock having a deflected portion, a feed-slide, feed-slide actuating mechanism, and a laterally-disposed feeder upon the slide adapted to feed a cartridge through the deflected part of the passage from the stock to the frame, substantially as set forth.

31. In a magazine repeating-gun, the combination with a cartridge-passage, and feed mechanism coöperating therewith to advance a series of cartridges through the same, of cartridge-point-deflecting mechanism adapted to deflect the point of each cartridge from the cap of its advance neighbor, comprising yielding detents which bear upon the cartridges as they pass through the passage, substantially as set forth.

32. In a firearm, the combination with a gun-frame, movable breech-block and locking-block movably secured thereto, of a cartridge-passage in the frame arranged at the side of the said block, and a yielding feeder upon the forward end of the locking-block, moving in the line of the passage and adapted to advance a cartridge from the passage, substantially as set forth.



33. In a firearm, the combination with a laterally-deflected magazine, of a reciprocating feed-slide provided with spring-feeders located at different intervals and arranged out of longitudinal alinement corresponding to the lateral curvature of the magazine, and spring-detents arranged in corresponding order for preventing the backward movement of the cartridges, substantially as described.

34. A firearm containing a cartridge-chamber for holding a supply of cartridges, in combination with a support for confining the cartridges in said chamber, means for moving said support from beneath the cartridges, and mechanism for feeding the cartridges, substantially as described.

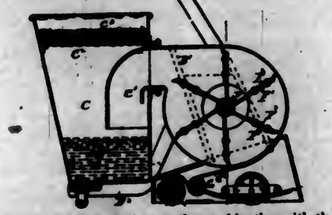
35. A firearm having a chamber for containing a supply of cartridges, in combination with a pair of supports, arranged at the discharge of said chamber, means for simultaneously operating said supports from beneath the cartridges, and suitable feeding mechanism, substantially as and for the purpose described.

36. A firearm having a chamber for containing a supply of cartridges, in combination with spaced supports for confining the cartridges therein, a rotatable disk, arms or links interposed between said disk and the supports, an arm on the spindle of the disk for turning the latter, and means for engaging and holding said arm, substantially as described.

601,709. PIPE-THIMBLE. PATRICK V. DWYER, St. Paul, Minn., assignor to Louise A. Frank, same place. Filed May 15, 1896. Serial 591,736. (No model.)

Claim.—1. As an improved article of manufacture, a thimble of the clam described, made up of telescoping sections, the intermediate spiral spring having its ends rigidly connected to one of said sections, and the threads or projections upon the other section engaging said spring intermediate of its ends.

2. As an improved article of manufacture, a thimble of the clam described, comprising in combination the telescoping sections, the intermediate resilient spiral connected by its ends to one section, and the means carried by the other section for engaging said spiral intermediate of its connections.



601,710. BICYCLE. RIENZO C. FAY, Springfield, Ohio, assignor to the Thomas Manufacturing Company, same place. Filed Sept. 17, 1896. Serial No. 606,022. (No model.)

Claim.—1. In a bicycle, the combination with the driving shaft or arbor having a projection recessed and shouldered, the shoulder being generally crosswise but oblique to the axis of the shaft, a crank or pedal with an eye fitted to the shaft and an opening crosswise of the projection, a wedge-bolt having a shoulder oblique to its own axis and the axis of the shaft, and fitting the oblique shoulder on the projection of the shaft, said wedge-bolt being fitted also to the opening, and an opposing surface on the shaft or arbor to resist the crank or pedal when the bolt is moved in one direction.

2. In a bicycle, the combination with a driving shaft or arbor having a shoulder generally crosswise but oblique to its axis, a crank fitted to said shaft or arbor, a wedge-bolt fitted transversely through the eye of the crank and having a shoulder oblique to its own axis and in line with the oblique shoulder on the shaft or arbor, a sprocket-wheel having a connection with the crank and reversible on the arbor, and a fixed surface on the arbor inside of the sprocket and against which it is pressed by the crank through the action of the oblique shoulders.

601,711. CARPET-CLEANER. ALBERT F. GUE, Boston, Mass., assignor to the Gue-Donnell Company, same place. Filed Oct. 8, 1897. Serial No. 654,555. (No model.)

Claim.—1. In a carpet-cleaner, the combination with the casing, the carpet-beating device and the air exhaust apparatus, of a water-receptacle having the air-exhaust delivered upon the surface of the water therein, and a moistened screen covering the mouth of said receptacle, whereby the heavier particles of dirt removed from a carpet are held by said water free from further action on the part of the discharging air, and the finer particles of dust are caught by the said screen which is kept constantly moistened by the spray arising from said water as distributed by said air-blast.

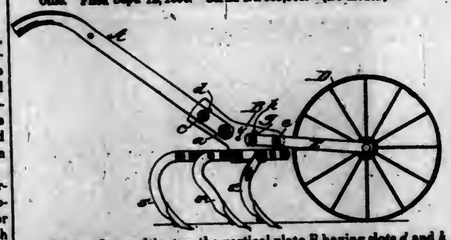
2. In a carpet-cleaner, the combination with the casing, the carpet-beating device and the air-exhaust apparatus, of a water-receptacle having the air-exhaust delivered upon the surface of the water therein, and a layer of curled hair adapted to wholly close the mouth of said receptacle, and to be kept constantly moistened by the spray arising from the water in the receptacle, substantially as and for the purpose set forth.

3. In a carpet-cleaner, the combination with the casing, the carpet-beating device and the air-exhaust apparatus, of a water-receptacle having the air-exhaust delivered upon the surface of the water therein, a wire screen closing the mouth of said receptacle and a layer of curled hair supported by said wire screen, and adapted to be kept constantly moistened by the spray arising from the agitated water in said receptacle, substantially as and for the purpose set forth.

4. In a carpet-cleaner, the combination of series of carpet-beating arms, a casing snugly containing the same, a fan-casing and fan fan, means for actuating said fan and beaters, a water-receptacle located immediately behind said fan, and a flue taking the exhaust from said fan and discharging upon the surface of said water, substantially as and for the purpose set forth.

5. In a carpet-cleaner, the combination with the casing, the rocking-shaft and the beater-arms elastically impressed downward, of the rigid arm projecting from said rocker-shaft, the revoluble wheel located above said arm and the striking-wheels linked to said revoluble wheel as set forth, whereby the rotation of the latter wheel is adapted by the forcible impact with said rigid arm of said striking-wheels to actuate said beaters.

6. In a carpet-cleaner, the combination with the beating device and the casing snugly inclosing the same, of the fan located upon said casing and provided with a casing of its own centrally communicating with the said beater-casing, the supporting-arms extending rearwardly from said casing, and the water-receptacle supported upon said arms and means for detachably securing it in communication with said fan, substantially as and for the purpose set forth.

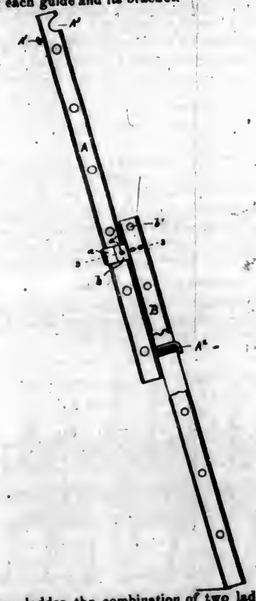


601,712. SHREDDER. LEVI L. LANE, Chicago, Ill., assignor to the Whitman & Barnes Manufacturing Company, Akron, Ohio. Filed July 17, 1897. Serial No. 644,835. (No model.)

Claim.—1. In a shredder, the combination of the annular cutting-plates, the series of annular hubs cast on said annular cutting-plates having a cylindrical portion fitting upon an inner sleeve and a raised portion which extends around said cylindrical portion at an incline to the axis thereof and the sleeve with which said hub interlocks, substantially as described.

2. In a shredder the combination of the shaft 1, the sleeve 2, rigidly attached to said shaft 1, said sleeve having on its outside the three ridges 6, a series of cutting-plates or saws 8 having hubs 9 adapted to fit over said sleeve, three ridges on the inside of said hub 9 adapted to engage with the three ridges 6 on the outside of said sleeve 2, means for securing said plates and hubs to said sleeve, said plates 8 being substantially parallel with each other and at such an angle to the axis of said shaft 2 that opposite edges of successive plates lie in substantially the same plane perpendicular to the axis of said shaft, substantially as described.

601,718. CULTIVATOR. DAVID M. MOTHERWELL, Chicago, Ill., assignor to the Whitman & Barnes Manufacturing Company, Akron, Ohio. Filed Sept. 13, 1896. Serial No. 605,505. (No model.)

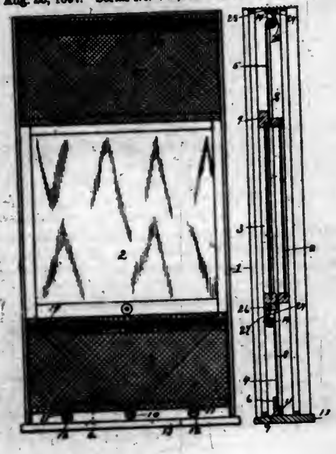


Claim.—In a cultivator, the vertical plate B having slots *d* and *h* and holes *a* and *c* by which a handle-frame and wheel are adjustably connected and having another hole for securing a tool-standard, for the purpose specified.

601,714. STEP AND EXTENSION LADDER. CHARLES HAPIER, Rochester, N. Y., assignor to Isaac H. Dewey, same place. Filed Sept. 25, 1897. Serial No. 653,047. (No model.)

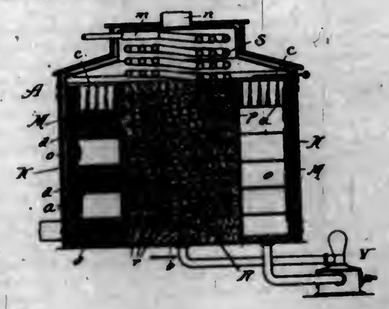
Claim.—1. In a ladder, the combination of two ladder-sections, one of which has an upper stop A' and lower stops or hooks A^2 thereon, there being a notch A^3 in each side rail, a pair of stationary brackets *b* upon the other section B, guides *a* fitting upon the outer

side and both edges of each side rail of the section A, and a pivot a' connecting each guide and its bracket.



2. In a ladder, the combination of two ladder-sections, one of which, A, has stops thereon and a notch A^2 in each side rail for engaging a round of the other section B and thereby supporting said section B, a pair of stationary brackets b upon the other section, a guide a fitting upon each side rail of the section A and a pivot a' connecting each guide and its bracket.

3. In a ladder, the combination of two ladder-sections, one of which, A, has stops thereon, and is provided with means for engaging and thereby supporting the other section B, a pair of stationary brackets b upon the section B, a guide a fitting upon the outer side and both edges of each rail of the section A, and a pivot a' connecting each guide and its bracket.



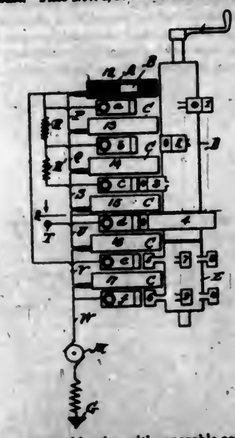
4. In a ladder, the combination of two ladder-sections, one of which, A, has stops comprising hooks A^3 thereon, a pair of stationary brackets b upon the other section B, a guide a fitting upon the outer side and both edges of each side rail of the section A, and a pivot a' connecting each guide and its bracket.

601,715. WINDOW-SCREEN. JOHN H. ORSTAD, Dayton, Ohio. Filed Aug. 25, 1897. Serial No. 649,493. (No model.)

Claim.—A window-screen comprising fibrous material 4 having its lower horizontal edge secured between strips 6 and 7 so that the vertical edges of said material will lie close to the parting-strips of the window-frame, a roller to which the upper horizontal edge of said material is attached, two horizontal strips 26 attachable to the bottom of a window-sash, brackets 24 secured to the upper side of said strips, and upon which the said roller is mounted, and a strip of fibrous material inclosed longitudinally between said strips 26 in line with the longitudinal center of the roller and adapted to rest on said roller throughout the length thereof, as shown and described.

601,716. CONDENSING-WATER AND AIR COOLING APPARATUS FOR REFRIGERATING-MACHINES. JULIUS SIEBLACHE, Nuremberg, Germany. Filed Feb. 26, 1897. Serial No. 626,120. (No model.) Patented in France Dec. 21, 1892, No. 226,556; in Germany Jan. 13, 1893, No. 72,657; in Italy Mar. 28, 1893, No. 1,194; in Austria-Hungary May 6, 1893, No. 1,089 and No. 5,637, and Aug. 20, 1893, No. 10,230 and No. 19,809; in Switzerland July 22, 1893, No. 7,263, and June 30, 1894, No. 8,798; in Belgium Aug. 25, 1894, No. 96,943, and in England May 14, 1895, No. 9,530.

Claim.—1. In a refrigerating apparatus, an air-cooler comprising, in combination, a refrigerator R having the surrounding shell p incased in a shell M, a vertical series of intercommunicating chambers o between said shells, means for forcing air upward through said chambers, a pump for forcing the liquid upward through said refrigerator to fall through said chambers, and thereby produce a continuous circulation of the liquid, and an outlet for the air, substantially as described.



2. In a refrigerating apparatus, an air-cooler comprising, in combination, a refrigerator R having the surrounding shell p incased in a shell M, a vertical series of intercommunicating chambers o between said shells, coiled pipe S in the upper part of the cooler in the path to the air-outlet a therefrom and affording a drier, means for forcing air upward through said chambers to said outlet, and a pump for forcing the liquid upward through said refrigerator to fall through said chambers and thereby produce a continuous circulation of the liquid, substantially as described.

3. In a refrigerating apparatus, a condenser C comprising, in combination, the coiled pipe r' incased in a shell p' surrounded by a shell M', a vertical series of intercommunicating chambers o' between said shells, means for forcing air upward through said chambers, and a pump for forcing the liquid upward through said shell p' to fall through said chambers and thereby produce a continuous circulation of the liquid, substantially as described.

4. In a refrigerating apparatus, the combination of an air-cooler A having an outlet n and containing the refrigerator R and the intercommunicating chambers o surrounding said refrigerator, means for forcing air upward through said chambers, a pump for forcing the liquid upward through said refrigerator to fall through said chambers and thereby produce a continuous circulation of the liquid, and a condenser C having an outlet n^3 in its upper end communicating with said cooler near its base, said condenser containing the incased coiled pipe r' and the circumferential intercommunicating chambers o' and communicating from its base portion with the outlet n of said cooler, and a pump for forcing the liquid upward through the incasement of said coiled pipe to fall through said chambers and thereby produce a continuous circulation of the liquid, substantially as described.

5. In a refrigerating apparatus, the combination of an air-cooler A, a condenser C communicating from its upper end with the cooler at its base, a blower D in said communication, a chamber B communicating with said cooler at its upper end and with said condenser at its base, and pumping means for circulating the liquid of the air-cooler and condenser through each, substantially as described.

601,717. SOLENOID BLOW-OUT FOR DISPERSING ARCS FORMED IN BREAKING ELECTRIC CIRCUITS. SIDNEY H. SHORT, Cleveland, Ohio. Filed Nov. 1, 1897. Serial No. 657,051. (No model.)

Claim.—1. The combination with separable contacts arranged in an electric circuit of a spiral conducting-coil arranged in proximity to said contacts and normally in shunt-circuit therewith, said coil adapted to be introduced in the circuit of said contacts at the moment circuit is broken between said contacts, as and for the purpose set forth.

2. The combination with separable contacts arranged in a circuit to be broken, a conducting-coil having a central open space, said central open space being arranged in proximity to said contacts, said coil being normally in shunt-circuit with said contact, and means whereby said coil is introduced into main or direct circuit at the moment circuit is broken between said contacts, as and for the purpose set forth.

3. The combination with separable contacts included in a circuit to be broken, a coil of conducting material arranged in insulated convolutions, said coil being arranged in proximity to said contacts, said coil being normally in shunt-circuit with said contacts, and means for introducing said conducting-coil into working circuit with said contacts at the instant the circuit is broken between said contacts, as and for the purpose set forth.

4. The combination with separable contacts arranged in a circuit to be broken, a conductor normally in shunt-circuit with said contacts and arranged in convoluted coils, an inclosing case for said conductor, and means for introducing such conductor into the main circuit of said contacts at the moment circuit is broken between such contacts, as and for the purpose set forth.

5. The combination in a controller of a switch including a series of separable contacts, an electric blow-out coil arranged in proximity to each pair of such separable contacts, said electric blow-out coils being normally out of main working circuit with said contacts, and means whereby said coils are introduced into the main working circuit of said contacts at the moment circuit is broken between such contacts, as and for the purpose set forth.

6. The combination in a controller of a switch including contacts, a conductor formed into convoluted coils having a central open space and arranged in proximity to each pair of separable contacts, said coils being normally out of main working circuit with said contacts, and means for introducing such coils into the main working circuit of said contacts in advance of the opening or breaking of said circuit between said contacts, as and for the purpose set forth.

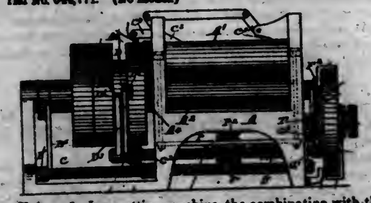
7. The combination of a controller-cylinder having contact-segments, stationary fingers arranged in the main circuit adapted to contact with said segments whereby the main circuit is made or broken and the motor-resistance and motor connections varied, a conducting-coil arranged in proximity to the point where circuit is broken between each finger and its cooperating segment, and contact-terminals and segments whereby said coils are out of main working circuit while the controller-cylinder is in running position but adapted to be introduced into main working circuit at the moment circuit is broken between said fingers and segments, as and for the purpose set forth.

8. The combination in a controller of a cylinder, contacts mounted thereon, relatively stationary cooperating contacts, a conducting-coil arranged in the circuit to be broken adjacent to each pair of contacts to be broken, said coils comprising spiral convolutions, a shunt-circuit for said coils and contacts controlling said shunt-circuit, whereby when said controller is in "running" position said coils are cut out of working circuit, but are replaced in circuit in advance of the opening of said circuit, as and for the purpose set forth.

9. In a controller, a series of separable contacts for controlling the main circuit, a corresponding series of conducting-coils arranged in proximity to said separable contacts, said coils being arranged in series with each other and normally out of the main working circuit, and means whereby said coils are introduced to the main working circuit at the moment circuit is broken between said contacts, as and for the purpose set forth.

10. In a controller, a series of separable contacts, a conducting-coil arranged adjacent to and having a central open space presented toward each pair of contacts, and means for cutting said coils into and out of circuit with said contacts, as and for the purpose set forth.

11. In an electric controller, the combination with a plurality of fixed fingers and corresponding movable contacts and conducting-coils arranged in proximity to and having a central open space presented toward the contact ends of said fingers and adapted to be cut into and out of the circuit thereof, as and for the purpose set forth.



601,718. HOT AND COLD WATER FAUCET. GUSTAVE A. SODERLUND, Somerville, Mass. Filed Sept. 30, 1897. Serial No. 653,598. (No model.)

Claim.—1. In a faucet of the character described, the casing provided with hot and cold water inlets; the plug provided with ports for receiving hot and cold water; the spout B secured to the casing; a downwardly-extending rod eccentrically secured to the lower end of the plug; the valve P normally seated against the inner end of the spout; and the valve-stem P' extending rearward from said valve and pivotally connected at its rear end with said eccentric-rod, substantially as and for the purpose set forth.

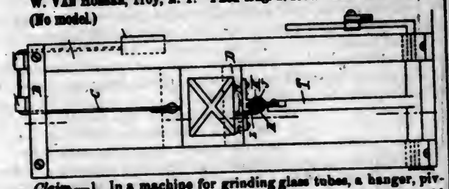
2. In a faucet of the character described, the casing provided with hot and cold water inlets; the plug provided with ports for receiving hot and cold water; the spout B secured to the casing; a downwardly-extending rod eccentrically secured to the lower end of the plug; the valve P normally seated against the inner end of the spout; the valve-stem P' extending rearward from said valve and provided with the slot E'' whereby said stem is loosely connected with said eccentric-rod; and the guide S' rigidly connected with the front end of said valve, substantially as and for the purpose set forth.

601,719. CUTTING-MACHINE. JOHN H. TAYLOR, Cohoes, N. Y., assignor to J. H. Wilson & Co., same place. Filed July 16, 1897. Serial No. 644,771. (No model.)

Claim.—1. In a cutting-machine, the combination with the feed-rolls, of a rotary pattern-disk, means for operatively connecting the disk and rolls; a cutter; means for actuating the rolls and cutter alternately; and a trip on the pattern-disk engageable with the alternating mechanism to operate the same, substantially as described.

2. In a cutting-machine, the combination with the feed-rolls and cutter, of a drive-shaft for the feed-rolls, a drive-pulley rotary independently of said shaft, a sleeve rotary on said shaft independently of said pulley, a beveled gear fixed on said shaft, a beveled gear fixed on said pulley, a pinion rotatively fixed on said sleeve in engagement with both of said beveled gears, operating connections between said

sleeve and cutter; a brake for said sleeve; a brake for said shaft; a rotary pattern-disk; roll-actuated mechanism for rotating the disk; and means actuated by the pattern-disk for applying said brakes alternately, substantially as described.



3. In a cutting-machine, the combination with the feed-rolls, the drive-shaft therefor, the cutter, and means for operating the drive-shaft and cutter alternately, of a rotary pattern-disk, intermittent gear connections between the drive-shaft and disk, a trip carried by the pattern disk engageable with said alternating mechanism; and means for releasing the intermittent gear and restoring the disk to its initial position, substantially as described.

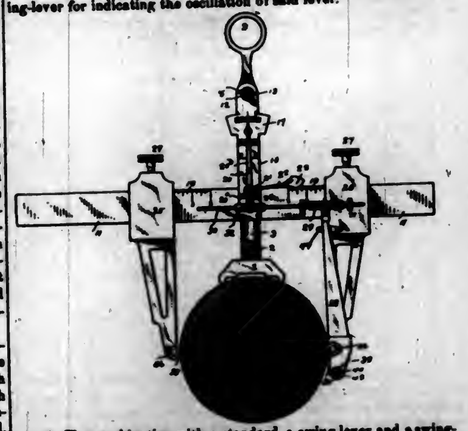
4. In a cutting-machine, the combination with the feed-rolls drive-shaft, and cutter, of a rotary pattern-disk, a trip carried by said disk, an intermittent gear connection between said disk and shaft, a drive-pulley rotary independently of said shaft, a sleeve rotary on said shaft independently of said pulley, a beveled gear fixed on said shaft, a beveled gear fixed on said pulley, a pinion rotatively fixed on said sleeve in engagement with both of said beveled gears, a brake for said shaft, a brake for said sleeve, a brake-shaft, connections between the brake-shaft and several brakes whereby rocking movements of said brake-shaft cause the brakes to operate alternately, an arm on the brake-shaft projecting into the path of said trip, a cutter-operating shaft, a cam connection between the cutter-operating shaft and said sleeve, a connection between the cutter-operating shaft and said intermittent gear, and a spring and stop for restoring the pattern-disk to its initial position, substantially as described.

5. The combination with a pair of feed-rolls, and means for supporting and driving said rolls, of segmental journal-bearings for one of said rolls, two pairs of rods, each pair connected at one end with one of said segmental bearings, a common cross-plate connected with the other end of both pairs of rods, a fixed support, and a spring interposed between said support and plate, substantially as described.

6. In a cutting-machine, the combination with feeding mechanism, and a fixed cutter, of an obliquely-movable cutter, a spring-supported presser-bar having a roller-track on its upper side; and a pair of yielding rollers secured to the obliquely-movable cutter and adapted to engage and roll upon said track, substantially as described.

601,720. MACHINE FOR GRINDING GLASS TUBES. THEODORE W. VAN HORNEN, Troy, N. Y. Filed Aug. 2, 1897. Serial No. 646,766. (No model.)

Claim.—1. In a machine for grinding glass tubes, a hanger, pivotally supported; a tube-carrier capable of revolving within said hanger; a means for preventing the longitudinal movements of said carrier in said hanger; a thimble adapted to be inserted within the ends of said carrier; the end of said carrier slotted and tapered, arranged to exert a pressure upon the thimble substantially as described.



2. In a machine for grinding glass tubes, a hanger suitably supported; a carrier adapted to engage with said hanger, allowing for the revolution of the carrier within the hanger; a means for preventing the longitudinal movements of the carrier within the hanger; a ratchet mounted on the carrier, a dog suitably mounted adapted to engage the said ratchet when the carrier is horizontal and to become disengaged therefrom after the carrier has made a partial revolution substantially as described.

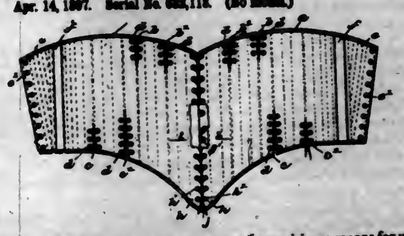
601,721. INSTRUMENT FOR MEASURING DIAMETERS. GEO. VIER, Ansonia, Conn. Filed June 30, 1897. Serial No. 642,897. (No model.)

Claim.—1. The combination with a standard, a swing-lever suspended therefrom and having a scale, and a swing-bar rigidly secured to the swing-lever, of adjustable slides on the swing-bar, a bearing-lever pivoted to one of the slides, said bearing-lever and the other slide being adapted to engage a roll and mechanism intermediate the bearing-lever and the scale whereby variations in the diameter of the roll are indicated on the scale.

2. The combination with a base, a standard, a swing-lever suspended therefrom and having a scale and a swing-bar rigidly secured to the swing-lever, of adjustable slides on the swing-bar, a bearing-lever pivoted to one of the slides, said bearing-lever and the other slide being provided with hardened bearings to engage a roll and mechanism connected with the bearing-lever for indicating variations in the diameter of the roll.

3. The combination with a standard, a slide 4 adjustable thereon, a swing-lever pivoted to the slide and a swing-bar fixed to the swing-lever, said standard and said swing-bar being provided with scales 18 for the purpose set forth, of slides 25 and 26 on the swing-bar, a bearing-lever pivoted to slide 26, said bearing-lever and slide 25 being adapted to engage a roll and mechanism connected with the bearing-lever for indicating the oscillation of said lever.

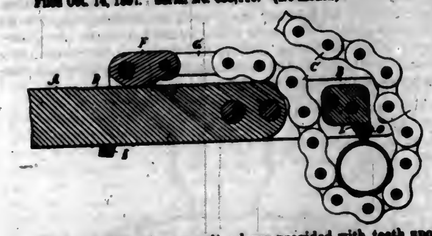
4. The combination with a standard, a swing-lever and a swing-bar secured thereto, of adjustable slides on the swing-bar, a bearing-lever pivoted to one of the slides, said bearing-lever and the other slide being adapted to engage a roll, indicating-lever 20 and adjusting-rod 30 pivotally connected to the bearing-lever and to the short arm of the indicating-lever.



5. The combination with a standard, a swing-lever having a scale, and a swing-bar secured to the swing-lever, of adjustable slides on the swing-bar, a bearing-lever pivoted to one of the slides, said bearing-lever and the other slide being adapted to engage a roll, indicating-lever 20, adjusting-rod 30, block 32 adjustable on said rod to which the bearing-lever is pivoted and block 32 also adjustable on said rod to which the short arm of the indicating-lever is pivoted.

6. The combination with a standard, a swing-bar suspended therefrom, adjustable slides on the swing-bar and a bearing-lever pivoted to one of the slides, of an indicating-lever having a hub 21, an arm and weight extending from said hub at an angle to the lever and adjusting-rod 30 to which the bearing-lever and the short arm of the indicating-lever are connected.

7. In an instrument of the character described the combination with a swing-bar, slides thereon, and a bearing-lever pivoted to one of said slides, said bearing-lever and the other slide being provided with adjustable hardened bearings adapted to engage opposite sides of the center of a roll, of an indicating-lever and an adjusting-rod to which the indicating-lever and the bearing-lever are connected.

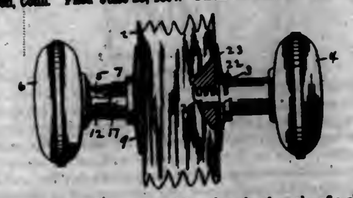


8. In an instrument of the character described the combination with a swing-lever having a scale, a swing-bar, slides thereon, and a bearing-lever pivoted to one of said slides, said bearing-lever and the other slide being adapted to engage a roll, of an indicating-lever the long arm of which registers with the scale and an adjusting-rod which is connected to the bearing-lever and to the short arm of the indicating-lever.

601,722. CORSET. LILLIAN S. WALKER, Boston, Mass. Filed Apr. 14, 1897. Serial No. 632,118. (No model.)

Claim.—The improvement in corsets comprising a means for uniting the parts in front consisting of a series of hooks *g*, studs *f*, covering flaps *h h*, provided with rows of eyelets *h' h'*, and a lacing *j*, substantially as shown and described.

601,728. PIPE-WRENCH. ALBERT WEBER, Camden, N. J. Filed Oct. 14, 1897. Serial No. 655,119. (No model.)



Claim.—1. In a pipe-wrench, a lever provided with teeth upon its edge, and jaws upon its inner end, combined with a chain, a movable clutch to which the inner end of the chain is attached, and a sharp-edged bearing in the lower edge of the lever; the chain being provided with pivotal points, and the inner sides of the jaws with cavities to receive the pivots, substantially as set forth.

2. In a pipe-wrench, the lever provided with sockets in its lower edge, and the triangular bearing provided with sharp points or teeth, and means for clamping the pipe or rod against the sharp edge of this bearing, substantially as specified.

3. In a pipe-wrench, a lever provided with teeth upon its inner end, a slide or keeper placed thereon, a clutch pivoted thereto and adapted to engage with the teeth, and a chain loosely connected to the clutch and passing down between the two jaws, combined with a sharp-edged bearing upon the lower edge of the lever; the inner sides of the jaws being provided with a cavity, and the links of the chain being provided with pivotal points or bearings which catch in the cavity, whereby the chain can be adjusted from either end, substantially as shown and described.

601,724. KNOB ATTACHMENT. HENRY J. P. WHIPPLE, New Haven, Conn. Filed June 26, 1897. Serial No. 642,948. (No model.)

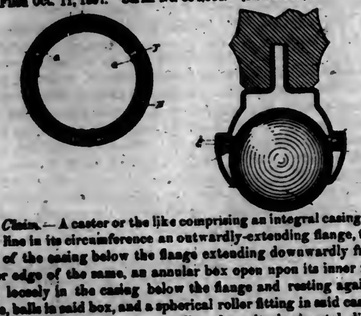
Claim.—1. The combination with a door-knob neck, of a sleeve mounted upon said neck and adapted for a free sliding movement longitudinally of the latter, and a detent upon said neck adapted to make contact with said sleeve to limit its movement, one of said two contacting parts being provided with a plurality of contact-surfaces located at varying distances from the inner end of the neck, to hold the sleeve in different positions upon the latter, substantially as described.

2. The combination with a door-knob neck, of a sleeve mounted upon said neck and projecting at its inner end beyond the end of the latter, said sleeve being free to move longitudinally upon the neck and being provided with a plurality of engaging surfaces located at varying distances from its inner end, and a detent upon the neck adapted to engage said surfaces on the sleeve interchangeably, substantially as and for the purpose described.

3. The combination with the neck of a door-knob, of a sleeve loosely mounted upon said neck and projecting at its inner end beyond the end of the latter, said sleeve having in its outer end a series of notches or depressions of a progressively-varying depth, and a spring-actuated detent radially movable upon the neck and adapted, in its outermost position, to engage the notches or depressions in said sleeve, substantially as described.

4. The combination with the neck of a door-knob having located thereon a radially-movable, spring-actuated detent the outer face of which is shouldered as described, of a sleeve loosely mounted upon said neck and overlapping at its outer end said detent, said sleeve having in its said outer end a series of notches or depressions of varying depth to receive the shoulder on the detent, substantially as set forth.

5. The combination with a door-knob neck provided with a circumferential groove or recess and with a longitudinal notch or recess leading therefrom to the end of said neck, of a detent having a stem or shank which enters a transverse socket in said neck and having its outer face provided with a shoulder as described, a spring located in said socket and exerting outward pressure against the stem of said detent, and a sleeve loosely mounted upon said neck and overlapping said detent at one end, said sleeve being provided with an internal projection to enter the circumferential groove in the neck and having at the end thereof which overlaps said detent a series of notches or depressions of varying depth to receive the shoulder on the latter, substantially as described.

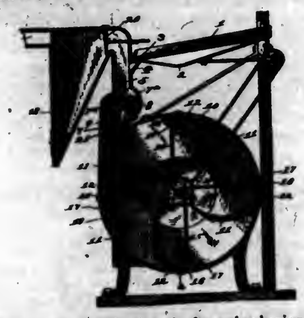


6. The combination with the knob-neck 5 having the recess 13 and socket 15, of the detent 12 having the stem 14 which enters said socket and the shoulder 17, spring 16, and sleeve 7 projecting at its inner end beyond the end of said neck and having in its outer end the series of notches 10 of varying depth, substantially as described.

601,725. CHATELAINE. SOPHIA ZEUSCHMIDT, Allegheny, Pa. Filed May 8, 1897. Serial No. 636,137. (No model.)

Claim.—In chatelaines, the combination of a frame suspended from a belt, and consisting of two downwardly-extending strips of material and a third piece of material interposed between and attached to said strips; a pocket on each of said strips, and a third pocket on said intermediate piece.

601,726. BALL-CASTER. GEORGE L. BOVEROUX, Oakland, Cal. Filed Oct. 11, 1897. Serial No. 654,831. (No model.)



Claim.—A caster or the like comprising an integral casing having at a line in its circumference an outwardly-extending flange, the portion of the casing below the flange extending downwardly from the outer edge of the same, an annular box open upon its inner face fitting loosely in the casing below the flange and resting against the same, balls in said box, and a spherical roller fitting in said casing and projecting therefrom, and, at a line above its horizontal diameter, bearing upon the balls in the box; substantially as described.

601,727. MUSIC-CHAIR. WILBUR O. CAMPBELL and EVA K. CAMPBELL, Sulphur Springs, Ark. Filed Sept. 30, 1896. Serial No. 607,493. (No model.)

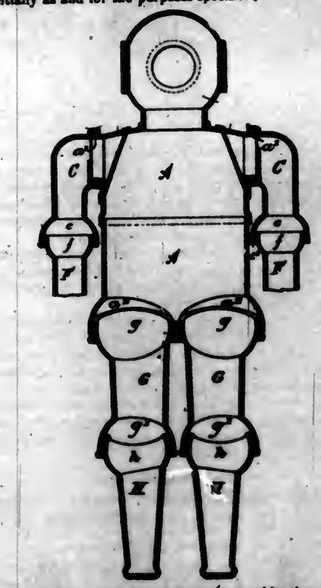
Claim.—The combination with a suitable supporting-frame, of a vertically-adjustable seat mounted on the same, an auxiliary seat hinged to each side of the main seat so as to be folded thereon or extended at will, and vertically-adjustable supporting-legs pivotally connected to the outer ends of the auxiliary seats and each comprising two spaced slotted pivoted bars, a yoke, the respective arms of which are slotted, and connecting-screws adapted to be passed through the slots of the respective pivoted arms and arms of the yoke, whereby the yoke may be raised or lowered to adjust the height of the support, substantially as described.

601,728. SCOURING, DISINTEGRATING, AND SEPARATING MACHINE. JOHN M. CASE, Cincinnati, Ohio. Filed Apr. 15, 1896. Serial No. 587,955. (No model.)

Claim.—1. The combination of a fan-casing having an abrading inner surface, a combined fan and abrader comprising air-blast-producing blades and abrading-surfaces, an approximately circular chamber and a straight outer wall provided with an overhanging upper portion which deflects the material upward and forward into said chamber across the air-blast, said chamber and wall being located on the upgoing side of the fan, the deflecting-board 9 and the adjustable partitions 8 which receive the descending material in the dead-air space formed by the curvature of the chamber and the said deflecting-board 9.

2. The combination of a combined fan and disintegrator comprising blast-producing blades, outer scouring, abrading or grinding surfaces, a fan-case having an inner scouring, abrading or grinding surface, and a tangential outlet and an approximately curved chamber provided with an outer straight wall having an overhanging upper portion situated on the upgoing side of the fan, the adjustable partitions, and the dead-air space formed by the deflecting-board 9.

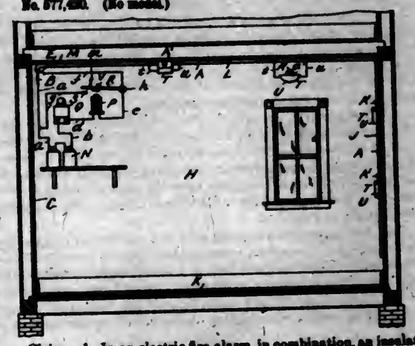
3. The combination of a fan-casing having an abrading inner surface, and a combined fan and abrader comprising blast-producing blades, and abrading-surfaces, both in said casing, radial brace-bars connecting the outer ends of the blades to the hub of the fan, adjusting-nuts on said rod adapted to engage the blades whereby the fan-arms may be adjusted to variable distances to the fan-case to simultaneously vary the abrading and fan action; said fan-casing having a tangential discharge-opening, and a chamber formed with a front straight wall provided with an overhanging upper portion, and a curved rear wall, adjustable partitions, and a deflecting-board 9 arranged in said chamber, the curvature of the chamber and the deflecting-board forming a dead-air space whereby the material is continuously deflected across the upgoing blast of air delivered by said fan simultaneously with the material.



4. In a combined disintegrating and separating machine, the combination of a combined fan and reducer having adjustable arms provided with fan-blades and abrading or grinding surfaces, a fan-casing surrounding said fan and also provided with disintegrating surfaces, in which both the separating blast and reduction take place, a tangential outlet in said fan-casing, an approximately circular chamber provided with a straight outer wall having an overhanging upper portion, said chamber communicating with the said tangential outlet, a return-passage consisting of a dead-air space formed by a deflecting-board 9 and the curved rear wall of said chamber, also making communication between the fan-casing and the said circular chamber, an escape-passage for the air-blast and light materials beyond said circular chamber, and settling-chambers; all substantially as set forth.

601,729. DIVING APPARATUS. WILLIAM R. FAREY, London, England. Filed Mar. 11, 1897. Serial No. 627,070. (No model.)

Claim.—1. In an improved diving-dress constructed from metal sections, joints connecting the various parts formed from a hemispherical socket on one part, and a hemispherical enlargement on the adjacent part fitting into the socket closely, flanges limiting the motion of the parts and packing forming a water-tight joint substantially as and for the purposes specified.

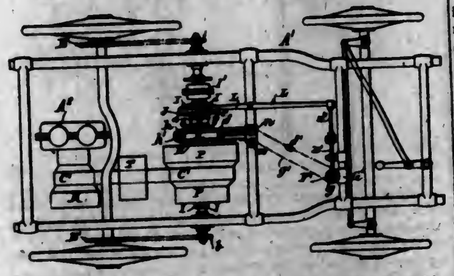


2. In an improved diving-dress formed from metal sections connected together, the combination with ball-and-socket joints at the elbows, hips and knees and leather packing in the said joints, of flanges on the shoulder-piece, an enlargement at the top of the upper arm-piece, channeled leather packing placed in the groove formed by the enlarged part and a screwed ring completing the joint substantially as described and shown and for the purposes specified.

3. In an improved diving-dress constructed from metal and made in sections connected together, joints for the elbows, hips and knees, formed from a hemispherical socket on one part, a hemispherical enlargement on the adjacent part pivoted to and fitting closely in the socket, flanges on the inside of the socket and on the enlargement and limiting the motion, packing formed from a channeled leather ring placed in the joint and a screwed ring fixing the packing in place substantially as and for the purposes specified.

4. In an improved diving-dress the combination with a metal body-piece, a head-piece screwed into the top of the body, upper and lower arm-pieces and upper and lower leg-pieces all constructed from metal of ball-and-socket joints for the elbow, hips and knees formed from hemispherical enlargements on the ends of the parts pivoted together flanges on these enlargements channeled leather packing-rings and screwed rings holding the packing in place, and shoulder-joints formed from flanges on the shoulder-pieces, enlargements on the upper ends of the arm-pieces leather packing-rings in the channel so formed and screwed rings completing the joint, constructed substantially as described and shown in the accompanying drawings and for the purposes specified.

601,780. HEAT-DETECTOR FOR ELECTRIC FIRE-ALARM SYSTEMS. JOHN D. GOULD, Brooklyn, N. Y. Filed Jan. 30, 1899. Serial No. 677,490. (No model.)



Claim.—1. In an electric fire-alarm, in combination, an insulated block, a recess or chamber in said block, a bulb or globule or knob of fusible metal or compound of metal suspended over said recess, and two wires or conductors extending into said recess independent of and insulated from each other, an electric cable or conductor composed of a central core of copper or other electric wire, a covering of fusible metal or compound of metal over said central wire, an insulating material over said fusible metal, an electric wire or wires wound upon the insulating material and an insulating material covering the whole, the central wire with its fusible-metal covering and the electric wire wound upon the insulating material being electrically connected to the two wires respectively of the insulated block and respectively to the two poles of an electric battery.

2. In an electric fire-alarm, in combination, an insulated block, a recess or chamber in said block, a bulb or globule or knob of fusible metal or compound of metal suspended over said recess, and two wires or conductors extending into said chamber independent of and insulated from each other, two other wires arranged in close proximity side by side but electrically separated from each other, one of said wires being formed of a metal fusible at a low temperature, said latter wires at one end being respectively connected to the wires of the block and respectively connected at their other ends to the poles of an electric battery.

3. In an electric fire-alarm, in combination, an insulated block, a recess or chamber in said block, a bulb or globule or knob of fusible metal or compound of metal suspended over said recess and two wires or conductors extending into said chamber independent of and insulated from each other, and two other wires, one of which is formed of a fusible metal or compound of metal and covered with an insulating material and the other of said wires being wound about and over the insulating material, said latter wires at one end being respectively connected to the wires of the insulated block and at their other ends respectively connected to the poles of an electric battery.

601,781. MOTOR-VEHICLE. CHARLES R. LAVERRY, Chauny, France. Filed Aug. 30, 1897. Serial No. 649,812. (No model.)

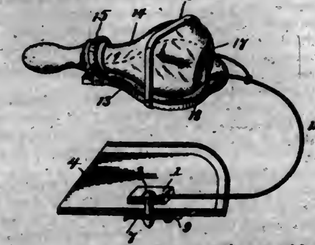
Claim.—1. In variable-speed apparatus, the combination with a stepped pulley, of a speed-changing mechanism, and a speed-reversing mechanism operatively connected thereto, and means for operating both the speed-changing and the speed-reversing mechanisms.

2. In variable gearing, the combination with internal and external gears revolving together, of a pinion for meshing with either of said gears, said pinion and gears relatively movable, and constituting the one a driving and the other a driven part, and means for moving the movable part for alternately engaging the pinion with the different gears, and thereby reversing the motion of the driven part.

3. The combination with a shaft, of a wheel loosely mounted thereon and having two gear-wheels connected to and revolving with it in its interior, a pinion for meshing alternately with said gears, a differential pinion driven by said first pinion, a carrier for said pinions movable axially to bring said first pinion into mesh with either of said gears, and a third gear-wheel meshing with said second pinion.

4. The combination with a driving-pulley having a spur-gear, of a pinion meshing with said gear, a carrier for said pinion, a second pinion driven by said first pinion, a second gear meshing with said second pinion, a brake controlling rotation of said second gear, a shaft carrying said pulley-carrier and second gear, and a clutch for clutching said second gear to said shaft, whereby said second gear can be clutched to said shaft and then will cause the shaft and pulley to revolve together, and can be held immovable by said brake, and then will cause said pulley and carrier to revolve at different speeds.

5. The combination with a variable-speed apparatus, of a shaft having one member of a clutch, a speed-changing mechanism having a reciprocal member of a clutch, a pulley in operative connection with said mechanism, and a spring tending to engage the members of said clutch and thereby lock said pulley and mechanism together.



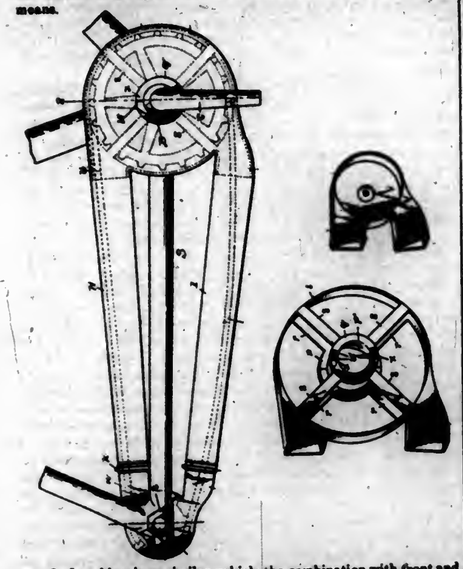
6. The combination with a variable and reversible speed mechanism, of a controlling mechanism therefor to be operated by the operator of the car, having two movements, and movable to a plurality of positions, said controlling mechanism when in one position disengaging said speed mechanism to arrest the car, when in another position throwing said mechanism into engagement for driving a car forward at a relatively great speed, when in another position engaging said speed mechanism for driving a car forward at a lesser speed, and when in another position engaging said mechanism for driving a car to the rear, and a car carrying said speed and controlling mechanisms.

7. For a variable and reversible speed mechanism, an operating-handle comprising a rod having both a reciprocatory and a rotary motion, a pinion on the rod, a brake for controlling a speed mechanism having brake-straps and oppositely-threaded nuts in their adjacent ends, a reversely-threaded screw engaging said nuts and having a pinion, and a connection between the pinions of said rod and screw driving the latter with the former, a shifter for reversing said mechanism, and a connection between said shifter and said rod for operating the former with the reciprocatory motion of the latter.

8. In variable-speed mechanism, a shaft, a wheel loosely mounted thereon, two gears fixed on said wheel, the one an internal and the other an external gear at different positions longitudinally of the shaft, a pinion for meshing with said gears, movable axially to engage with either and to a neutral position relatively to both, a second pinion of different diameter to the first and revolving therewith, a carrier for said pinions keyed to the shaft, a third gear meshing with said second pinion and rotative on said shaft, a clutch having one member fixed to the shaft and the other member fixedly connected to said third gear for clutching the latter to rotate with and freeing it from the shaft, means for operating said clutch, and means for moving said pinions axially, substantially as and for the purpose set forth.

9. In variable-speed mechanism, a shaft, a wheel loosely mounted thereon, two gears fixed on said wheel, the one an internal and the other an external gear at different positions longitudinally of the shaft, a pinion for meshing with said gears, movable axially to engage with either and to a neutral position relatively to both, a second pinion of different diameter to the first and revolving therewith, a carrier for said pinions keyed to the shaft, a third gear meshing with said second pinion and rotative on said shaft, a clutch having one member fixed to the shaft and the other member fixedly connected to said third gear for clutching the latter to rotate with and freeing it from the shaft, means for operating said clutch, means for moving said pinions axially, a brake for controlling rotation of said third gear, and means for operating said brake, substantially as and for the purpose set forth.

601,782. ADJUSTABLE NURSING-BOTTLE HOLDER. GEORGE W. MCCOLLOM, Council Bluffs, Iowa. Filed June 26, 1897. Serial No. 642,511. (No model.)



Claim.—1. A support for nursing-bottles, comprising the plate 1, the arm 12, fixed thereto, the supporting-plate 13, fixed in a horizontal position to the upper end of said arm, and provided with the staples 15 and 16, and the detachable pin 17, and means for detachably securing said plate 1 to a nursery chair or table as and for the purpose set forth.

2. The combination with the resilient arm 12, a supporting-plate 13, fixed thereto, and means as described for securing a nursing-bottle to said supporting-plate, of the plate 1, fixed to said resilient arm, and provided with a central orifice, the bolt 2 provided with the annular groove 6, and a latch-plate 7, provided with the recess 10 adapted to removably secure said bolt in place, as and for the purpose set forth.

601,788. GEAR-CASE. NORMAN A. PHILLIPS, New Castle, Pa., assignor to the Frost Gear Case Company, New York, N. Y. Filed Jan. 19, 1897. Serial No. 619,803. (No model.)

Claim.—1. In a bicycle or similar vehicle, the combination with sprockets and intermediate motion-transmitting means, of a frame inclosing one of said sprockets and provided with openings through which the transmitting means passes, an elastic covering closely fitting the frame, openings in the covering registering with those of the frame, a casing for the second sprocket having openings through which the transmitting means passes and elastic material intermediate

the frame and casing, secured thereto and inclosing the transmitting means.

2. In a bicycle or similar vehicle the combination with front and rear sprockets and intermediate means for transmitting motion, the sprockets being correlatively adjustable, of a frame inclosing the front sprocket, openings in the frame through which the transmitting means passes, elastic material fitted upon the frame and having tubular extensions corresponding in location with their respective openings in the frame and inclosing the motion-transmitting means, and a casing for the rear sprocket having openings through which the transmitting means passes, the said tubular extensions being secured to the casing.

3. In a bicycle or similar vehicle, the combination with the front and rear sprockets and adjacent tie-rod, of casings for the sprockets, flexible tubes intermediate the casings and inclosing the free chain-sections, rigid linings within the tubes intermediate their extremities, and clamps engaging the tubes exteriorly of the linings, said clamps having connection with the tie-rod.

4. In a device of the class described the combination with a sprocket of an inclosing frame comprising rings having radiating spokes, and a band secured to the spokes and encircling the rings, said band having an opening adapted for the passage of the sprocket therethrough.

5. In a device of the class described, a frame comprising rings having peripheral grooves and radiating spokes, said rings lying in parallel planes and upon a common axis, a band secured to said spokes and encircling the rings, openings in the band terminating in tubular extensions and an additional opening in the band.

6. A sprocket-casing comprising a frame having an elastic covering said frame comprising rings and a band supported thereby and openings in the covering corresponding to those of the rings, the material surrounding the openings of the covering lying upon the rings.

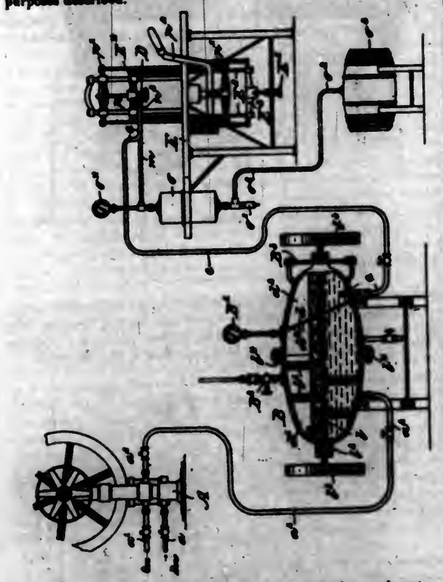
7. A sprocket-casing comprising a frame having an elastic cover, said frame comprising rings and a band supported thereby, said rings having peripheral grooves, openings in the covering corresponding to those of the rings, the material surrounding said openings lying within the grooves of the latter.

8. In a bicycle or similar vehicle the combination with the driving-wheel and the driven wheel of a suitable motion-transmitting device, and a casing for one of said wheels consisting of a rigid frame suitably perforated for the passage of said motion-transmitting device and formed of separable parts including a grooved ring located upon one side of the driving-wheel, an exterior covering of soft elastic rubber having one edge suitably supported at or upon one side of the wheel and its other edge contracted in or upon said grooved ring, substantially as described.

9. In a bicycle or similar vehicle the combination with the driving-wheel, the driven wheel and a suitable motion-transmitting device, of a covering for one of said wheels consisting of a metal frame attached to the vehicle, said frame having tubular extensions for the passage of the motion-transmitting device, and an elastic flexible box or case having substantially the same form or outline as said frame and corresponding tubular extensions, said elastic flexible case inclosing and contracting upon said metal frame, substantially as described.

601,784. CORSET-STEEL. MARY R. MCCLOSKEY-PLATTER, New York, N. Y. Filed Jan. 9, 1897. Serial No. 618,831. (No model.)

Claim.—1. A corset steel or stiffener comprising the springs *a* and *b*, each slotted at one end and adapted to slide one upon the other, the caps *c* and *e* secured respectively to the springs *a* and *b*, and the pins *d* and *f* uniting the two portions of the caps and passing through the slots of the springs.

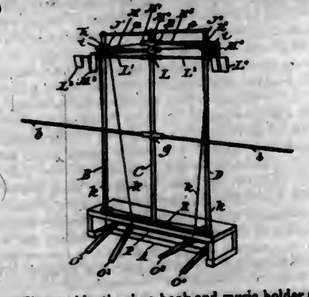


2. The combination with a corset-steel composed of two springs arranged to slide one upon the other and provided with slots, *a' b'*, and caps, *c*, and *e*, and pins, *d*, and *f*, uniting the two portions of the caps and passing through the slots of the springs, one of said springs being provided with a row of fastening devices, of a sheath of fabric or like material inclosing the springs and constructed with longitudinal oblong openings through which pass the fastening devices, whereby the sliding movement of the springs with reference to each other, the caps, and the pins, is permitted without strain or wear upon the fabric or material of the sheath, substantially as and for the purpose herein set forth.

3. In a corset, the combination of two steels placed at opposite edges of the front opening of the corset and each composed of two springs, *a*, and, *b*, caps, *c*, and *e*, and pins, *d*, and *f* uniting the two portions of the caps, of a row of fastening-eyes, *f*, extended from the edge of one of the steels in a like plane to the latter, and a corresponding row of buttons, *g*, placed upon the opposite steel and projecting at an angle to the plane thereof, of sheaths, *h*, *h*, composed of fabric or like material and provided with elongated openings through which pass, respectively the eyes and the buttons, and which are so proportioned to the size and shape of the said fastening devices as to prevent strain upon the material of the sheaths by or during the bending of the steels, substantially as and for the purpose herein set forth.

601,785. APPARATUS FOR CARBONATING AND BOTTLING MALT LIQUIDS. CHARLES SAW, Philadelphia, Pa. Filed Jan. 22, 1897. Serial No. 620,168. (No model.)

Claim.—1. In an apparatus of the character described, a carbonator, divided into two chambers by a transversely and obliquely arranged partition, the upper portion of said partition being perforated to permit of the flow of liquid from one chamber to the other without foaming, substantially as and for the purposes described.



2. In an apparatus of the character described, a carbonator, a shaft traversing the same, agitating blades or paddles secured to one portion of said shaft, and an obliquely-arranged partition dividing said carbonator into two chambers in only one of which the paddles are adapted to rotate, said partition having its upper portion perforated to permit of the passage of liquid from the agitating-chamber to the other chamber without foaming, substantially as and for the purpose described.

3. In an apparatus of the character described, a carbonator, a bottling-table and a nozzle, a delivery pipe leading from the carbonator to the nozzle and terminating in the nozzle in a conical screen or rose adapted to direct the liquid against the walls of the nozzle, substantially as and for the purposes described.

4. In an apparatus of the character described, a carbonator divided into two chambers by a partition, the upper portion whereof is perforated to permit of the flow of liquid from one chamber to the other, a delivery-pipe leading from the latter chamber, a bottling-nozzle, and a conical rose located within the nozzle and connected with said delivery-pipe, substantially as and for the purposes described.

601,786. MUSIC OR BOOK HOLDER AND RACK. ANDREW J. SHEPPARD, Chicago, Ill. Filed June 23, 1897. Serial No. 642,210. (No model.)

Claim.—The combination in a book and music holder and rack, with a box A of uprights B, C, D, firmly secured thereon, said upright C being provided with collars *g*, bearing the arms *f*, *f*, and collars L, M, M^4; the collars L_1, M_1, M^4 being provided with arms L', L^2, M', M^3, said arms bearing clasps L^3, L^4, M^5, M^6, said arms M', M^3 being movable around the upright C, the cords *i*, *i*, *i*, *i*, and the keys O', O^2, O^3, O^4, substantially as set forth.

601,787. COMBINATION-TOOL. ALVA B. SMITH, Oakland, Texas. Filed Mar. 13, 1897. Serial No. 627,126. (No model.)

Claim.—1. In a tool of the class described, the combination of a handle having an extension formed at its outer end into a coring-blade, a paring-blade having position below the extension, and provided with angularly-bent ends extending up through openings in said extension, means for adjusting the said paring-blade relatively to the extension, and means auxiliary to the said adjusting means for holding the paring-blade in adjusted position, substantially as described.

2. In a tool of the class described, the combination of a tubular handle provided with an extension having its outer end formed into a substantially semicircular coring-blade, a paring-blade below the said extension and provided with angularly-bent ends projecting through openings in said extension and having teeth or serrations to engage therewith, a spring to normally project the said paring-blade outwardly from the extension, and means for holding the said blade against the tension of the spring, substantially as described.

3. In a tool of the class described, the combination of a handle provided with an extension having the outer end thereof formed into a coring blade and provided with openings, a paring-blade having position below the extension and provided with right-angularly-extending ends projecting through said openings, and a corkscrew pivoted to the said extension and having its heel end adapted to bear against one of the said ends of the parer-blade and by frictional contact therewith hold the said blade relatively to the said extension, substantially as described.

4. In a tool of the class described, the combination of a handle provided with an extension having its outer end formed into a coring-blade, a paring-blade extending parallel with the said extension and provided with bent ends projecting through said extension, a spring to normally press the blade outward from the handle extension, and a corkscrew pivoted to the extension and having its heel end bearing against one of the angularly-bent ends of the paring-blade, whereby, by moving the said corkscrew, the paring-blade may be held against the tension of the said spring, substantially as described.

601,788. APPARATUS FOR MANUFACTURING CLOSED-ENDED VESSELS. LUIGI STAMPACCHIA, Bologna, Italy, assignor to Ernesto G. Fabbri, New York, N. Y. Filed Aug. 10, 1896. Serial No. 602,302. (No model.) Patented in Italy Sept. 15, 1894, No. 37,179; in Switzerland Mar. 14, 1896, No. 12,178; in England Mar. 18, 1896, No. 6,089; in Belgium Mar. 31, 1896, No. 120,364, and in France June 25, 1896, No. 254,784.

Claim.—1. An apparatus for elongating open-ended vessels, comprising a die-plate having an opening, a portion of the wall of said opening being inclined downward and inward and the upper and lower portions of the wall of said opening being extended beyond the extremities of the inclined portion, a hollow plunger having its lower end beveled off downward and inward, to correspond to the inclination of said inclined wall, means for reciprocating said hollow plunger and holding it rigidly with the lower outer corner of its lower end within the die-opening, an inner plunger and means for reciprocating it through the hollow plunger and the die-opening.

2. An apparatus for elongating open-ended vessels, comprising a die-plate having an opening, a portion of the wall of said opening being inclined downward and inward and the upper portion of the wall of said opening being extended beyond the upper extremity of the inclined portion, a hollow plunger having its lower end beveled off downward and inward, to correspond to the inclination of said inclined wall, means for reciprocating said hollow plunger and holding it rigidly with the lower outer corner of its lower end within the die-opening, an inner plunger and means for reciprocating it through the hollow plunger and the die-opening.

3. An apparatus for elongating open ended vessels, comprising a die-plate having an opening, a portion of the wall of this opening being inclined downward and inward, a hollow plunger adapted to enter said opening and having its lower end beveled off to correspond to the inclination of the wall thereof, whereby a rigid-walled converging channel is formed, an inner plunger adapted to reciprocate through the hollow plunger and the die-opening, and means for bringing the two plungers down into the die together as one solid plunger and holding the outer plunger within the die-opening while the central one passes on through the same, as and for the purposes set forth.

4. An apparatus for elongating open-ended vessels, comprising a die-plate having an opening through it, a portion of the wall of said

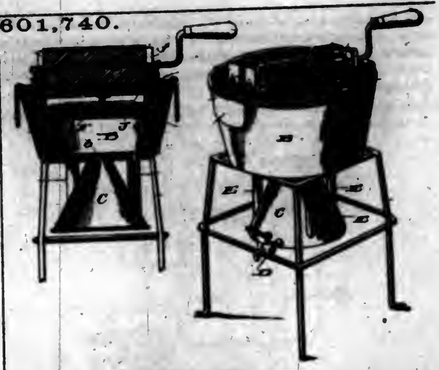
opening being inclined inward and downward, the upper and lower portions of the wall of said opening being extended beyond the extremities of the inclined portion, a hollow plunger having its lower end beveled to correspond to the inclination of said inclined wall, an inner plunger adapted to work through the hollow plunger and die-opening, and means for bringing the two plungers down upon the blank together as one solid plunger and holding the outer plunger with its lower corners within the die-opening while the inner plunger passes through, as and for the purposes set forth.

601,739. GRAIN MEASURER AND REGISTER. SCOTT STEWART and JOHN F. SWISHER, Rivesville, W. Va. Filed May 20, 1897. Serial No. 637,477. (No model.)

Claim.—1. In a measuring device, a chute, slides for alternately controlling the chute, and means whereby one slide is locked in position before the other slide receives any movement, substantially as described.

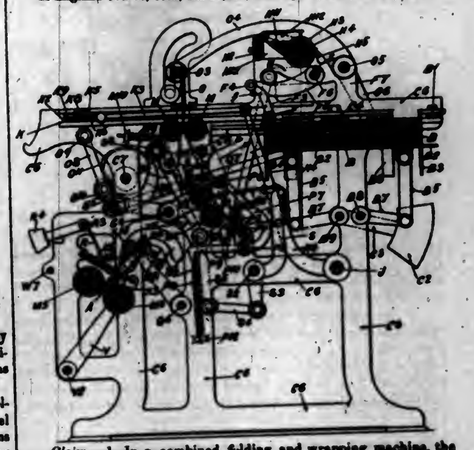
2. In a measuring device, a chute, slides for alternately controlling the passage therethrough, levers connected to the slides, a wheel having recesses to receive studs connected to the levers, and means for locking one lever against action while the other is receiving any movement, substantially as described.

3. In a device of the character described, a receptacle, slides controlling the passage therethrough, levers attached to the slides at one end and having slots in the opposite end, a stud arranged at the end of each lever with the slot, a wheel having a peripheral recess, and means for depressing the stud of the lever into the recess, substantially as and for the purpose described.



4. In a device of the character described, a receptacle, slides for controlling the passage therethrough, levers attached to the slides at one end and having slots in the opposite ends, a bracket having a stud, on the end of each lever with the slot, a wheel having a peripheral recess and a stud projecting from the side of the wheel, substantially as set forth.

601,740. WASHING-MACHINE. JOHN B. TURBEVILLE and MARION P. HIGGS, Lingleville, Tex. Filed Oct. 17, 1895. Serial No. 566,023. (No model.)



Claim.—1. The combination with a tub, having inclined sides, of a plate carrying a series of rollers, and metallic plates secured to opposite ends of the said plate, and having their outer ends bent to engage over the upper edge of the tub, with the portions within the tub inclined to conform to the inclination of the walls of said tub; substantially as described.

2. The combination with a tub having inclined walls, of a plate carrying a series of rollers and the metallic plates secured at one end to the under side of said plate at the ends each of said metallic plates having an inclined portion to conform to, and bear against, the inner surface of the inclined walls of the tub, and their other ends bent downward and outward forming a loop resting upon the upper edge of said tub, substantially as herein shown and described.

601,740.

601,741. MACHINE FOR FOLDING AND WRAPPING NEWSPAPERS. FRED WAITE, Otley, and JASON SAVILLE, Bradford, England. Filed Sept. 23, 1896. Serial No. 606,417. (No model.) Patented in England Oct. 31, 1891, No. 16,810, and Sept. 7, 1896, No. 16,815.

Claim.—1. In a combined folding and wrapping machine, the combination with a wrapper-box having a vertically-movable bottom and a stop against which the wrappers contained in the box are pressed when the said bottom is raised, of a roller having cut-away portions or recesses along its length, said roller being adapted to be brought into contact with the uppermost wrapper to apply gum thereto at intervals as described and means for lowering the bottom of the box after the gum has been applied to the said uppermost wrapper.

2. In a combined folding and wrapping machine, the combination with a gum-receptacle having a discharge-opening for the gum, and a roller projecting into said opening to receive gum, of a receptacle adapted to contain wrappers, a second roller adapted to be brought into contact with the uppermost wrapper, a driving-shaft, a cam-shaft, a cam on the latter, said shafts being geared together, a third shaft, connections intermediate the latter and the cam for effecting the rocking of the said third shaft, and a connection between the latter shaft and the said second roller whereby the latter is first brought into contact with the first roller to receive gum and then brought into contact with the uppermost wrapper to apply gum thereto.

3. In a combined folding and wrapping machine, the combination with a gum-receptacle having a discharge-opening for the gum, a distributing-roller projecting into said opening to receive gum, and a shaft upon which the distributing-roller is mounted, of a receptacle adapted to contain wrappers, a second roller adapted to be brought into contact with the uppermost wrapper, a driving-shaft, a cam-shaft, a cam on the latter, said shafts being geared together, a third shaft, connections intermediate the latter shaft and the cam for effecting the rocking of the said third shaft, a connection between the latter shaft and the said second roller whereby the latter is first brought into contact with the first roller to receive gum and then brought into contact with the uppermost wrapper to transfer the gum to the same, and connections intermediate the shaft of the gum-distributing roller and the cam whereby the said roller is intermittently moved when the said second roller is in contact with it.

4. In a combined folding and wrapping machine, the combination with a gum-receptacle having a discharge-opening for the gum, a distributing-roller projecting into said opening to receive gum, and a shaft upon which the distributing-roller is mounted, of a receptacle adapted to contain wrappers, a second roller adapted to be brought into contact with the uppermost wrapper, a driving-shaft, a cam-shaft, a cam on the latter, said shafts being geared together, a third shaft, connections intermediate the latter shaft and the cam for effecting the rocking of the said third shaft, a connection between the latter shaft and the said second roller whereby the latter is first brought into contact with the first roller to receive gum and then brought into contact with the uppermost wrapper to transfer the gum to the same, a toothed wheel on the shaft of the gum-distributing roller, a rock-lever loosely mounted on said shaft, a pawl carried by one end of said lever and engaging the toothed wheel, a rock-shaft, pivotally-connected levers connecting the latter with the rock-lever, and further pivotally-connected levers connecting the said rock-shaft with the cam on the cam-shaft.

5. In a combined folding and wrapping machine, the combination with a wrapper-box, and a roller adapted to be brought into contact with the uppermost wrapper and apply gum thereto, of a reciprocating carriage, a shaft thereon, a series of spring-actuated fingers, carried by the said shaft, said fingers being adapted to cooperate with a transverse gripping edge on the carriage to clamp a wrapper as described and the said shaft being adapted to be tilted so as to raise the fingers to permit the edge of the wrapper suspended from the gumming-roller to pass between the fingers and the said edge of the carriage, and means for varying the extent of reciprocation of the carriage consisting essentially of a driving-shaft, a cam-shaft, a cam on the latter, said shafts being geared together, a rock-shaft, arms on the latter, and adjustably connected together, a rod connected at one end with the cam, and having an adjustable connection at the other end with one of the said arms, arms on the rock-shaft and rods connecting the latter arms with the carriage.

6. In a combined folding and wrapping machine, the combination with the table of the machine adapted to support the papers to be folded and wrapped and having a slot, of a pair of rollers arranged beneath the table and having their nipping edges approximately in line with the slot, a folding-blade arranged vertically and adapted to reciprocate through the slot, a second pair of folding-rollers, tapes or bands adapted to conduct the wrapper and contents to the said second pair of rollers, and a second folding-blade arranged to fold and force the wrapper and contents between the second pair of rollers, a pair of sealing-rollers, a box, and means for tilting the box after having received the wrapper and paper and simultaneously moving it from the second pair of folding-rollers toward the sealing-rollers whereby the said wrapper and paper are presented to the sealing-rollers.

7. The combination with a pair of folding rollers and a pair of sealing-rollers, of a box adapted to receive the folded paper and wrapper from the folding-rollers and to be inverted to present the said paper and wrapper to the sealing-rollers, said box having an adjustable bottom or rest for the paper and wrapper, a back plate, and spring-pressed fingers adapted to grip the edge of the wrapper between them and the edge of said back plate.

8. The combination with a roller adapted to apply gum to the edge of a wrapper, said roller having reduced portions or grooves and adapted to apply gum at intervals along the edge of the wrapper, of folding-rollers provided with reduced portions or grooves corresponding to the like portions of the gumming-roller, a pair of sealing-rollers, a box adapted to receive the folded paper and its wrapper from the folding-rollers and to be inverted to present them to the sealing-rollers, said box having a back plate provided with notches corresponding to the grooves in the folding-rollers, and spring-pressed fingers adapted to grip the edge of the wrapper between them and the back plate.

9. The combination with a pair of folding-rollers and a pair of sealing-rollers, of a box adapted to receive the folded paper and wrapper from the folding-rollers and to be inverted to present them to the sealing-rollers, said box having a back plate, spring-pressed fingers adapted to grip the edge of a wrapper between them and the back plate, a rock-shaft carrying the said fingers, an arm on said rock-shaft, a projection on the machine against which said arm is adapted to strike to effect the opening of the fingers when the box is moved toward the folding-rollers, for the purpose of receiving the wrapper and contents.

10. In a combined folding and wrapping machine, the combination with a wrapper-box having a vertically-movable bottom, of rock-shafts, a segmental rack mounted on one of said shafts, pinions on the shafts gearing the same together, arms on said shafts, links pivotally connected to the arms and to the bottom of the box, and a weighted arm also mounted on one of the rock-shafts operating to normally force the said bottom upwardly, a rotatable cam-shaft, a cam thereon, an arm carrying a pawl adapted to engage the rack, said arm being loosely mounted on one of the rock-shafts, connections between the latter arm and the cam, and a pivoted lever having one end weighted and its opposite end operating upon the pawl to disengage it from the rack in the manner described.

11. In a combined folding and wrapping machine, the combination with a wrapper-box and its vertically-movable bottom, of means for raising and lowering said bottom consisting of shafts B^2, B^3, pinions thereon engaging each other, arms B^4 B^5, B^7 B^7 rigidly mounted on the shafts, links B^6 pivotally connected to the outer ends of the arms, and to the bottom, an arm on the shaft B^2 and carrying a weight, a segmental ratchet on the shaft B^2 an oscillatory arm D^2 loosely mounted on the latter shaft, a pawl loosely mounted on the arm D^2 and adapted to engage the ratchet D, a pivoted lever, one end carrying a weight and its other end being inclined and adapted to engage the pawl, and a stop to limit the throw of the latter lever.

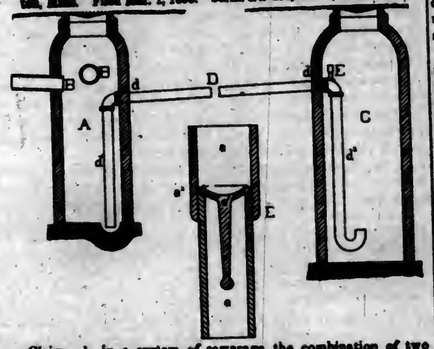
12. In a combined folding and wrapping machine, the combination with a wrapper-box having a vertically-movable bottom upon which the wrappers are placed, of a bar arranged above the bottom against which bar the wrappers are pressed, and means for normally pressing the wrappers against the bar consisting of links pivotally connected at one end to the bottom of the box, rock-shafts, arms secured at one end upon said shafts and being pivotally connected at the other end to the other end of the links, pinions upon the rock-shafts gearing together, and a weighted arm carried by one of the rock-shafts, as described.

13. In a combined folding and wrapping machine, the combination with a wrapper-box, of means for gumming one edge of the wrappers comprising a paste or gum receptacle, a cylinder projecting into the latter and adapted to receive gum on its periphery, swinging arms, a roller carried by the said arms and adapted to apply gum to the edge of the wrappers and means for periodically operating the swinging arms to cause the roller to be brought into contact with the cylinder and receive gum therefrom, consisting of a cam-shaft, a cam thereon, a pivoted lever G^2 carrying at one end a roller bearing upon the cam, a rod G^3 connected to the other end of the lever G^2, an arm G connected to the rod G^3, a rock-shaft to which the arm G is secured arms F^2 rigidly secured to the rock-shaft, a shaft loosely mounted in the arms F^2, and upon which shaft the swinging arms carrying the gumming-roller are mounted, a projection on one of the swinging arms, a roller on said projection, and an abutment against which the latter roller is adapted to strike.

14. In a combined folding and wrapping machine, the combination with a wrapper-box, of means for gumming one edge of the wrappers, comprising a gum-receptacle, a cylinder projecting into the latter and adapted to receive gum on its periphery, swinging arms, a roller carried by said arms adapted to apply gum to the edge of the wrappers, means for periodically operating the swinging arms to cause the roller to be brought into contact with the cylinder and receive gum therefrom, means for partially rotating the cylinder while the roller is in contact therewith, and means whereby the rotation of said roller is insured while in contact with the cylinder, consisting of a yielding roller mounted upon the shaft of the gumming-roller, and a disk mounted on the shaft of the cylinder and with which disk the yielding roller is adapted to come in contact, as described.

15. In a combined folding and wrapping machine, the combination with a wrapper box, of means for gumming one edge of the wrappers comprising a gum-receptacle, a cylinder projecting into the latter and receiving gum on its periphery, a gumming-roller adapted to apply gum directly to the edge of the wrappers, a set of swinging arms in which said roller is mounted, a second set of swinging arms to which the first set is pivotally connected, an abutment or tappet arranged to effect a swinging movement of the first set of arms independently of the second set at a certain point in the upward movement of the arms to thereby bring the gumming-roller into contact with the cylinder, and means for periodically raising the sets of arms, for the purpose specified.

16. In a combined folding and wrapping machine, the combination with a wrapper-box, of means for gumming one edge of the wrappers, comprising a gum-receptacle, a cylinder projecting into the latter and receiving gum on its periphery, a gumming-roller adapted to apply gum directly to the edge of the wrappers, a set of swinging arms in which said roller is mounted, a second set of swinging arms to which the first set is pivotally connected, an abutment or tappet, an antifriction-roller carried by one of the first set of arms and adapted to strike said tappet at a point in the upward movement of the said first set of arms and means for periodically raising the sets of arms for the purpose specified.



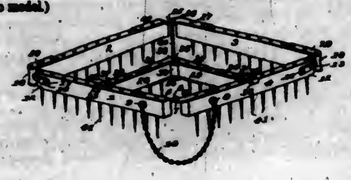
17. The combination with a pair of folding-rollers, of a box adapted to receive the paper and its wrapper after having been folded by said rollers a second pair of folding-rollers in proximity to said

box and a blade adapted to force the folded paper and wrapper between the said second pair of rollers to receive a second fold, a second box arranged to receive the paper and wrapper after being folded by the second pair of rollers, said second box adapted to be inverted after receiving the paper and wrapper, a rock-shaft, arms mounted thereon and within which arms said second box is loosely journaled, a crank on one of the journals of the said box, and provided with a pin, a cam-race within which said pin is arranged, whereby to effect the tilting or inversion of the said box when the rock-shaft is turned and a pair of sealing-rollers adapted to receive between them the contents of the second box when the latter is tilted, as specified.

18. The combination with a pair of folding-rollers, and a pair of sealing-rollers, of a box arranged intermediate said pairs of rollers, said box having an adjustable bottom, and being adapted to be inverted after receiving the folded paper and wrapper from the folding-rollers, and deliver the same to the sealing-rollers, and means for effecting the tilting or inversion of the box consisting of a rock-shaft, arms mounted thereon and within which arms said box is journaled, a crank on one of the journals of the box, and provided with a pin, and a cam-race within which said pin is arranged, as specified.

19. The combination with a pair of folding-rollers, and a pair of sealing-rollers, of a box arranged intermediate said pairs of rollers, and adapted to be inverted to deliver the folded paper and wrapper to the sealing-rollers, means for effecting the inversion of the box consisting of a rock-shaft, arms mounted thereon and within which arms said box is journaled, a crank on one of the journals of the box and provided with a pin, and a cam-race within which said pin is arranged and a series of gripper-fingers carried by the box adapted to grip the folded paper and wrapper after leaving the folding-rollers and during the inversion of the box, and until engaged by the sealing-rollers, as specified.

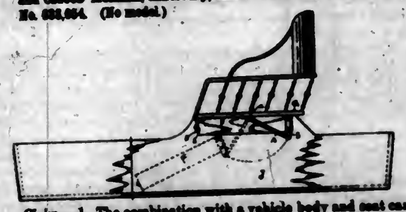
601,742. SEWER CONSTRUCTION. GEORGE E. WARING, Jr., Newport, R. I., assignor to the Drainage Construction Company, Boston, Mass. Filed Mar. 1, 1898. Serial No. 464,267. (No model.)



Claim.—1. In a system of sewerage, the combination of two wells or receptacles as shown, with the siphon and inlets as shown, the siphon having an approximately horizontal run located below the level of the inlet-pipes to one of the wells, substantially as shown.

2. In a system of sewerage, a siphon having its inlet and outlet normally sealed, being substantially horizontal but with sufficient rise toward its discharging end for the accumulation of air, and having suitable appliances for the extraction of accumulated air, substantially as described.

3. In a system of sewerage, a siphon, having its inlet and outlet normally sealed, and with the highest point of its course below the level to which accumulating water or sewage may be allowed to rise in the wells or chambers which it drains, in combination with suitable appliances for the escape of accumulated air, substantially as described.



601,743. COMBINED CULTIVATOR AND HARROW. JOSEPH A. WIMMER, Vancouver, Wash. Filed Mar. 17, 1897. Serial No. 627,905. (No model.)

Claim.—1. The beams 1, 2, 3, and 4, provided with a series of vertical parallel teeth and having their contiguous ends detachably hinged together, in combination with the intermediate beams 20 and 29, provided with a series of vertical parallel harrow-teeth, and having their outer ends detachably secured to said beams 1 and 4 and their rear converging ends hinged together and provided with a projecting hook 30, and the adjustable coupling-chain 40, connecting said hook with the contiguous ends of the main beams 2 and 3, substantially as shown and described.

2. A harrow comprising a horizontal frame, the angle-bracket 56 pivoted thereto by the bolt 59 and provided with the orifices 60, 62 and 67 in combination with the bolt 61, the standard 66, provided with the orifices 64 and 65 and the sleeve 70 and the bolts 63 and 69 adapted to adjustably secure said standard to said angle-plate, substantially as shown and described.

601,744. CURTAIN-BOX FOR VEHICLES. HARLAN P. WELLS and GEORGE MERRILL, Amesbury, Mass. Filed May 28, 1897. Serial No. 638,654. (No model.)

Claim.—1. The combination with a vehicle body and seat carrying one member of a locking device, of a curtain-box normally supported under the seat, having at its front end the other member of a locking device; and cooperating means attached respectively to the curtain-box and wagon-body for permitting the box to be concurrently lowered and advanced from under the seat, substantially as and for the purpose set forth.

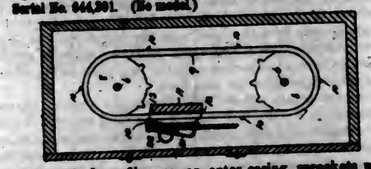
2. The combination with a vehicle body and seat carrying one member, of a locking device, of a curtain-box having a yielding bottom and normally supported under the seat, the said seat having at its front end the other member of a locking device; and cooperating means attached respectively to the curtain-box and wagon-body for permitting the box to be concurrently lowered and advanced from under the seat, substantially as set forth.

3. The combination with a vehicle body and seat carrying one member of a locking device, of a curtain-box normally supported under the seat, having at its front end the other member of a locking device; and pivotal cooperating means attached respectively to the curtain-box and wagon-body for permitting the box to be concurrently lowered and advanced from under the seat; in substance as set forth.

4. The combination with a vehicle of a seat; and a curtain-box supported under the seat by means of a rod A and slotted bearings B, B; in substance as set forth.

601,745. GARMENT-SUPPORTER. HENRY S. BREWINGTON, Baltimore, Md. Filed Oct. 2, 1897. Serial No. 653,826. (No model.)

Claim.—1. A garment-supporter or clasp comprising a plate, and a spring-tongue provided with rearwardly-pointed barbs or tangs turned toward the body of the tongue and adapted to be held, by the elasticity of said tongue, in contact with the plate, substantially as described.



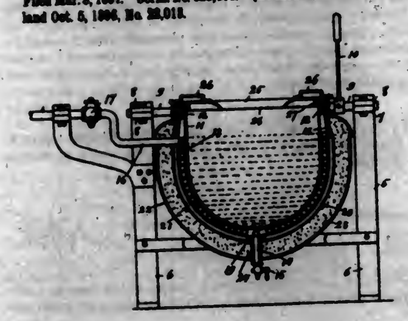
2. A garment-supporter or clasp comprising a plate, and a spring-tongue provided with rearwardly-pointed barbs or tangs stamped out of the metal of the plate and turned toward the body of the tongue and adapted to be normally held, by the elasticity of said tongue, in contact with the plate, substantially as described.

3. A garment-supporter or clasp comprising a plate, and a spring-tongue stamped out of the metal of the plate and bent to form a curved spring, being also provided with rearwardly-pointed barbs or tangs, turned toward the body of the tongue and adapted to be normally held, by the elasticity of said tongue, in contact with the plate, substantially as described.

4. A garment-supporter or clasp comprising a plate, and a spring-tongue stamped out of the metal of the plate and bent to form a curved spring, being also provided with rearwardly-pointed barbs or tangs, turned toward the body of the tongue and adapted to be normally held, by the elasticity of said tongue, in contact with the plate, at points outside of the space from which the head and barbs were stamped, substantially as described.

5. The herein-described clasp for garment-supporters, consisting of a single piece of elastic sheet metal, comprising the plate, A, and tongue, B, with head, C, and barbs or points, D D, the tongue being bent at E to form a curved spring on one side of the plane of the plate, and the head and its points projecting on the opposite side of said plane, the front edge of the head being held normally out of the plane of the plate to permit of the introduction of the fabric of the garment between the head and plate, and the points being inclined toward, and normally resting with spring-pressure on, the plate to cause them to engage the fabric so entered and prevent its withdrawal, substantially as described.

601,746. FILE-CASE. FRANK B. CLARK, West Bend, Iowa, assignor of one-fourth to M. W. Duddy, same place. Filed July 13, 1897. Serial No. 644,301. (No model.)



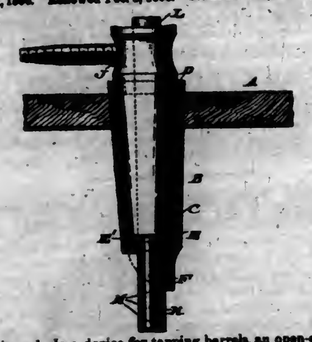
Claim.—1. In a file-case, an outer casing, sprockets mounted therein, endless bands traversing the sprockets, rods connected respectively with said endless bands, and means for rotating said bands, in combination with a letter-file, comprising a back plate, means for retaining documents thereon, and hooks whereby said plate may be attached to said rods, substantially as shown and described.

2. In a file-case, the combination with an outer casing, sprockets mounted therein, endless bands traversing said sprockets, rods connected respectively with said bands, and bearing-surfaces for said endless carriers, of a file consisting substantially of a back plate, means for retaining documents thereon, and hooks whereby said plate is movably attached to said rod, substantially as shown and described.

3. In a file-case, the combination with an outer casing, sprockets mounted therein, endless bands traversing said sprockets, rods connected respectively with said bands, and bearing-surfaces for said endless carriers, of a file consisting substantially of a back plate, means for retaining documents thereon, and hooks whereby said plate is removably attached to said rod, said outer casing being provided with means of access to said file, substantially as shown and described.

4. In a file-case, the combination with an outer casing, sprockets mounted therein, endless bands traversing said sprockets, rods connected respectively with said bands, and bearing-surfaces for said endless carriers, of a file consisting substantially of a back plate, and hooks whereby said plate is removably attached to said rod, said outer casing being provided with means of access to said file, a supplemental plate hinged to said back plate, having a catch pivoted thereto, and a spring-actuated retaining-clasp, substantially as shown and described.

601,747. CANDY-KETTLE. JOHN CLEAVE, Crediton, England. Filed Mar. 3, 1897. Serial No. 625,803. (No model.) Patented in England Oct. 5, 1896, No. 22,913.

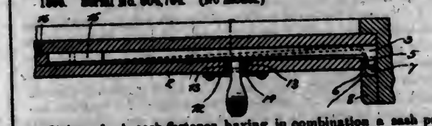


Claim.—The herein-described kettle comprising a pivotally-mounted kettle, a continuous coil of pipe surrounding the same and being in contact therewith, a steam-pipe communicating with said coil through a universal joint, a discharge-spout connected with the lower end of said coil, a casing inclosing the said coil, a double casing inclosing the first-named casing, the inner wall of which is held at a predetermined distance therefrom, a packing of asbestos between the walls of said double casing, and means for revolving said kettle, substantially as and for the purpose described.

601,748. POWER-TRANSMITTING CHAIN. THOMAS D. DUNDAS and GEORGE SEDDON, London, England; said Seddon assignor to said Dundas. Filed Mar. 20, 1897. Serial No. 628,518. (No model.) Patented in England Dec. 17, 1896, No. 26,576.

Claim.—A sprocket-chain comprising a series of links, blocks pivotally connecting the links together and lugs extending from each link to overhang the ends of a contiguous link, substantially as described.

601,749. DEVICE FOR TAPPING BEER-BARRELS. WILLIAM T. FINEGAN, Philadelphia, Pa., assignor to Carl Oldorp and Nellie T. Keenan, same place, and John J. Mahoney, Atlantic City, N. J. Filed Oct. 1, 1896. Renewed Feb. 8, 1898. Serial No. 669,998. (No model.)

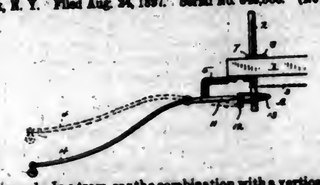


Claim.—1. In a device for tapping barrels, an open-ended shell, a valve or disk connected therewith, and a two-faced flange within said shell for said valve, the upper face forming a rest for a faucet, adapted to be inserted in the shell, and the lower face forming a seat for said valve.

2. In a device for tapping barrels, the combination of an open-ended shell C, with a disk or valve F adjacent to an end thereof, and an internal valve-seat E having a passage E' therethrough, said valve being adapted to normally rest upon said seat, and said shell being adapted to receive a tap having a pipe therein, said pipe being adapted to unseat said valve.

3. In a device for tapping barrels, &c., a hollow shell C open at one end and having the other end normally closed, a flange E within said shell having an opening E' therethrough, one side of said flange being adapted to serve as a seat for said valve F, and the latter having a portion H common to itself and to said shell, in combination with a tap J adapted to be inclosed by said shell and supported upon said flange E, and the perforated pipe K adapted to pass through said faucet and opening E' and to discharge air into the interior of said barrel.

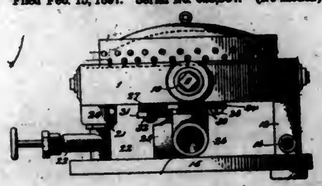
601,750. SASH-FASTENER. BENJAMIN N. GILPILLAN, Chicago, Ill., assignor of one-half to H. A. Wheeler, same place. Filed Sept. 3, 1896. Serial No. 604,764. (No model.)



Claim.—1. A sash-fastener having in combination a sash provided with a recess extending longitudinally of its horizontal frame member, a spring secured in said recess and having an angular bend at its outer end projecting from said sash and having its end turned at an angle to said bend and being rounded from top to bottom, a

bead arranged opposite the rounded end of said bead and having corrugations adapted to engage therewith, and means secured to said sash for depressing said spring, substantially as set forth.

2. A sash-fastener having in combination a sash provided with a mortise in its lower edge and having the opening 6 at the end thereof, a bead or guide-strip located opposite said opening 6, a block 16 driven into said mortise, a flat spring secured to and extending longitudinally of said block and having an angular bend forming a dog, projecting through said opening 6 and engaging with said guide-strip, said block 16 being cut away behind said spring, a lifting-lever pivoted to said sash and having the nose-piece 11 impinging said spring, and a thumb-piece located over said lifting-lever, substantially as set forth.



601,751. MECHANISM FOR LOWERING CAR-FENDERS. ROBERT HARRIS, Bridgeport, Conn., and MARCUS K. GOLDSMITH, New York, N. Y. Filed Aug. 24, 1897. Serial No. 649,308. (No model.)

Claim.—1. In a tram-car the combination with a vertically-swinging fender having a rigid arm extending backward therefrom, of a brake-staff carrying a device A which directly engages the arm and acts to swing the fender downward when the brake-staff is rotated to set the brake.

2. The combination with a vertically-swinging fender having a rigid arm extending backward therefrom and carrying an antifriction-roller, of a brake-staff carrying a spiral plate which engages the arm and acts to tilt the arm and allow the fender to swing downward when the brake-staff is rotated to set the brake.

601,752. VAPOR-BURNER. HARRY C. HOSMER, Indianapolis, Ind. Filed Feb. 15, 1897. Serial No. 623,537. (No model.)

Claim.—1. A retort comprising a hollow annular chamber, a web or bottom plate surrounded and supported thereby, said plate being provided with a central opening, and a removable disk seated on said plate and surrounded by the chamber and provided at its center with an annular flanged opening corresponding with the opening in the bottom plate, substantially as specified.

2. A retort, comprising a hollow annular chamber, a bottom plate supported by and surrounded by the said chamber, and provided with a central opening, and a removable disk seated on and supported by the bottom plate, and provided at its center with an opening registering with that of the plate, said opening in the disk being provided with a surrounding collar or flange, the lower end of which projects below the disk and fits removably in the opening in the bottom plate, substantially as specified.

3. The combination with a retort provided with a mixing-chamber and a vapor-discharge located below the latter, of a pair of movable tubes either of which is adapted to be moved into line with the vapor-discharge and mixing-chamber to the exclusion of the other, and one of which is provided with a lateral discharge out of line with the mixing-chamber and closed at said upper end.

4. The combination with a retort having a mixing-chamber, and a vapor-discharge located below the same, of a cut-off plate eccentrically pivoted with relation to the said mixing-chamber and provided with an opening that may be caused to register with the chamber by a movement of the plate, a tube extending from the opening in the plate and so disposed that when in line with the mixing chamber to aline with the vapor-discharge, and a second tube similarly located with relation to the mixing-chamber and vapor-discharge and extending from an imperforate part of the plate and provided below the same with a lateral discharge.

5. The combination with a retort having a mixing-chamber, a vapor-discharge located below the same, of a cut-off plate eccentrically pivoted to the under side of the retort at one side of the mixing-chamber and provided with an opening that may be caused to register with the chamber by a movement of the plate, a tube extending from the opening in the plate and so disposed that when in line with the mixing-chamber it will also be in alinement with the vapor-discharge, a second tube similarly disposed and located with relation to the mixing-chamber and vapor-discharge and extending from an imperforate part of the plate and provided with a lateral discharge, and means for limiting the pivotal movements of said plate whereby one or the other of said tubes will be brought into alinement as mentioned when the movement of the plate has been arrested by one of said stops.

6. The combination with a retort having a mixing-chamber, and a vapor-discharge located adjacent thereto but spaced therefrom, of a movable vapor-guide located between the said vapor-discharge and the mixing-chamber, and a tube eccentrically and pivotally supported with relation to the mixing-chamber and vapor-discharge, said tube being adapted to be moved into alinement with the vapor-discharge and the mixing-chamber and having its upper end closed and provided below the same with a side discharge-opening.

7. The combination with the annular retort provided with the centrally-located mixing-chamber, of the vapor-discharge located below and at one side of said mixing-chamber, a cut-off plate pivoted to the under side of the said retort eccentrically with relation to the mixing-chamber; said cut-off plate having an opening adapted to be registered with the mixing-chamber, a curved tube projecting downwardly and laterally from the opening in the cut-off plate so as to form a continuation of the mixing-chamber, and a companion similar tube extending from an imperforate part of said plate and provided with a side discharge below the said plate.

8. The combination with the retort having the centrally-located mixing-chamber, and the valved vapor-discharge at one side of and below the chamber, of a plate pivoted to the under side of the retort and the said chamber and provided with an opening in line with the chamber, an arm extending from the plate, a curved keeper-bar located under the arm and terminating in posts secured to the under side of the retort and forming stops for limiting the movement of the arm and plate, and a pair of tubes secured to the plate and curved so as to form a continuation of the mixing-chamber when in line with the vapor discharge, one of said tubes being located in line with the opening in the plate and the other of said tubes having its upper end closed by said plate, and provided at one side below the plate with a slit or escape-opening for the vapor, substantially as specified.

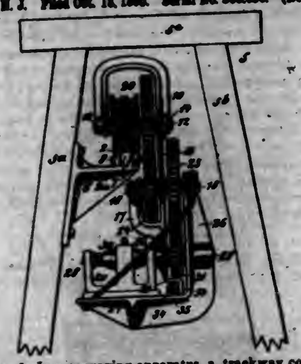
601,753. KITCHEN-RACK. MARGUERITE KAISER, St. Louis, Mo. Filed May 3, 1897. Serial No. 634,906. (No model.)

Claim.—1. In a rack, a suitable back-plate, side walls carried thereby, and disposed in planes perpendicular to the plane of the back-plate said walls tapering from bottom upward, suitable recesses disposed along said walls and inclining upwardly and progressively increasing in depth from top to bottom, the recess on one side alining with a corresponding recess on the opposite side, and the bases of the recesses being disposed in a plane removed a suitable distance from the adjacent surface of the back-plate, substantially as set forth.

2. In a rack, a suitable back-plate, side walls carried thereby, and disposed in planes perpendicular to the plane of the back-plate said walls being inclined toward one another and tapering from bottom upwardly, suitable recesses disposed along said walls and inclining upwardly and progressively increasing in depth from top to bottom, the recess on one side alining with a corresponding recess on the opposite side, and the bases of the recesses being disposed in a plane removed a suitable distance from the adjacent surface of the back, substantially as set forth.

601,754. CANDLE HOLDER AND EXTINGUISHER. JOHN W. KYHAST, Brooklyn, N. Y. Filed June 10, 1897. Serial No. 640,169. (No model.)

Claim.—1. A combination candle holder and extinguisher consisting of a disk or plate, an arm or rod connected therewith and provided at its end with means for securing it to a support, said disk or plate being provided with two semicircular jaws each of which is provided with an arm one of which is rigidly secured to said plate, the arm of the other being movable and being connected with the rigid jaw by a spring-hinge and means for operating said movable arm, another spring-operated arm pivotally connected with one of said jaws and provided with an extinguishing-plate adapted to be held to one side of said jaws by a candle which is inserted therein, and being adapted also to be projected over said jaws when the candle is consumed to a predetermined point, substantially as and for the purpose described.



2. A combination candle holder and extinguisher, consisting of a disk or plate, an arm or rod connected therewith and provided at its end with means for securing it to a support, said disk or plate being provided with two semicircular jaws, each of which is provided with an arm, one of said arms being rigidly secured to said plate and the other arm being movable and being connected with the rigid arm by a spring-hinge and means for operating said movable arm, another spring-operated arm pivotally connected with one of said jaws and provided with an extinguishing-plate adapted to be held out of engagement with the upper edge of said jaws by a candle which is inserted therein, and being adapted also to be projected over said jaws when the candle is consumed to a predetermined point, substantially as and for the purpose set forth.

601,755. EGG-POACHER. ELISABETH LOUDEN, Omaha, Nebr. Filed July 10, 1897. Serial No. 643,070. (No model.)

Claim.—As an article of manufacture, an egg-poacher consisting of a perforated body flared upwardly, portions of its lower edge being turned inwardly to form supporting-flanges, the remaining portions forming legs, and a removable bottom adapted to rest on said flanges.

601,756. CONVEYING APPARATUS. THOMAS S. MILLER, South Orange, N. J. Filed Oct. 12, 1895. Serial No. 565,630. (No model.)

Claim.—1. In a conveying apparatus, a trackway composed of two cables laid side by side each composed of wire strands, the strands of one cable being twisted inversely to those of the other, in combination with a traction-wheel running on said cables substantially as described.

2. In a conveying apparatus, in combination, a trackway composed of two cables laid side by side each composed of strands twisted together and a carriage containing a traction-wheel having upon its periphery the imprint of the supporting-surface of the strands of both of said cables, the strands of said cables being twisted inversely, substantially as described.

3. In a conveying apparatus, in combination, a load-carriage provided with a supporting grooved wheel and a trackway composed of a plurality of cables substantially equal in diameter laid side by side between the flanges of said wheel; said cables being composed of wire strands twisted inversely, substantially as described.

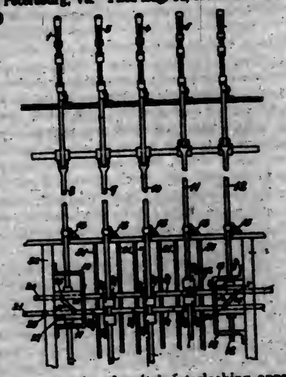
4. In a conveying apparatus, in combination, a load-carriage provided with a supporting grooved wheel and a track composed of a plurality of cables substantially equal in diameter laid side by side between the flanges of said wheel; said wheel being provided with an impression between its flanges corresponding with the supporting-surface of one or both of said cables, substantially as described.

5. In a conveying apparatus, in combination, two cables side by side, a rack parallel with them, a wheel having its periphery indented to correspond with the supporting-surface of said cable and gear-teeth adapted to engage with said rack, substantially as described.

6. A traction-wheel containing on its periphery impriate corresponding with the inversely-inclined strands of two side-by-side cables twisted in opposite directions, substantially as described.

7. A traction-wheel containing on its periphery the imprint of the strands of two side-by-side cables, in combination with gear-teeth, substantially as described.

8. In a conveying apparatus, in combination the shaft 12, the traction-wheel 20 and gear 22 fixed thereon, the shaft 13, the traction-wheel 21 and gear 23 fixed thereon and a frame consisting of the bridge-piece 11 carrying the ends of said shaft 12, the bridge-piece 10 carrying the ends of said shaft 13 and a longitudinal piece 14 connecting said bridge-pieces and a pendent piece 16 provided with bearings for the shaft 18, and the shaft 18 substantially as described.



9. In a conveying apparatus, in combination, a trackway, traction-wheels thereon, a frame carried by said traction-wheels, a shaft, as 18 carrying the gear-wheel 26, means whereby said gear-wheel is connected with said traction-wheels, a platform 27, a pivotal support for said platform concentric with said wheel 25, a motor mounted upon said platform, gearing whereby said motor is connected with said gear 25 and a steadying-arm 19 connected with said frame and having a slot through which the shaft of said motor passes, substantially as described.

10. In a conveying apparatus, in combination, the traction-wheels, the shafts 12 and 13, the frame provided with the bearings for said shafts, the gears 22 and 23 fixed to said shafts, the shaft 18 also having its bearing in said frame, the gears 24 and 25 fixed upon said shaft 18, the pendulum-frame pivoted upon the end of said shaft 18, a motor-shaft 28 carried by said pendulum-frame and a gearing 21 whereby said motor-shaft is connected with said gear 25, substantially as described.

11. In a conveying apparatus, in combination, the traction-wheels, the shafts 12 and 13, the frame provided with the bearings for said shafts, the gears 22 and 23 fixed to said shafts, the shaft 18 also having its bearing in said frame, the gears 24 and 25 fixed upon said shaft 18, the pendulum-frame pivoted upon the end of said shaft 18, a motor-shaft 28 carried by said pendulum-frame and a gearing 21 whereby said motor-shaft is connected with said gear 25, an arm extending downward from said traction-wheel frame and a bearing-surface upon said pendulum-frame resting in contact with said arm as said pendulum-frame vibrates upon the shaft 18, substantially as described.

12. In a conveying apparatus in combination two cables laid side by side the strands of one cable being twisted inversely to those of the other and a traction-wheel having upon its periphery an imprint of the supporting-surface of said strand, substantially as described.

601,757. SIGNAL AND SWITCH INTERLOCKING APPARATUS. ELLERSON P. OWEN, Manchester, Va., assignor of one-half to Morton Riddle, Jr., Petersburg, Va. Filed Aug. 11, 1897. Serial No. 647,910. (No model.)

Claim.—1. In a signal and switch interlocking apparatus, the combination of a series of switch-operating rods and signal-operating rods, said rods being provided with blocks or dogs, a locking-bar

perforated or slotted to permit the passage of the blocks or dogs through the perforations, and mechanism connected with one or more of the said rods, whereby the locking-bar will be moved, when one of the rods which are provided with the said mechanism is operated, to lock the other rods; substantially as described.

2. In a signal and switch interlocking apparatus, the combination of a series of switch-operating rods and signal-operating rods, said rods being provided with blocks or dogs which may be intercepted by a locking-bar, a locking-bar perforated or slotted to permit the passage of the blocks or dogs through the perforations or slots, and a plate or frame connected with one of the rods, and having means whereby it will, when operated, move the locking-bar to lock the other rods; substantially as described.

3. In a signal and switch interlocking apparatus, the combination of a series of switch-operating rods and signal-operating rods, said rods being provided with blocks or dogs which may be intercepted by a locking-bar, a locking-bar perforated or slotted to permit the passage of the blocks or dogs through the perforations or slots when the locking-bar is in its normal position, and which may intercept the said blocks or dogs when it is moved from its normal position, and provided with means whereby it may be moved, said means being engaged by a plate or frame connected with a switch-operating rod or signal-operating rod, and a plate or frame connected with one of the rods, and having an inclined face engaging the locking-bar, whereby it will, when operated, move the locking-bar from its normal position to lock the other rods; substantially as described.

4. In a signal and switch interlocking apparatus, the combination of a series of switch-operating rods and signal-operating rods, said rods being provided with blocks or dogs which may be intercepted by a locking-bar, a locking-bar perforated or slotted to permit the passage of the blocks or dogs through the perforations or slots when it (the locking-bar) is in its normal position, and which may intercept the blocks or dogs when it is moved from its normal position, and provided with means whereby it may be moved, said means being engaged by a plate or frame connected with a switch-operating rod or a signal-operating rod, and a plate or frame connected with one of the rods, and having an inclined face engaging the locking-bar, whereby it will, when operated, move the locking-bar from its normal position to lock the other rods; substantially as described.

5. In a signal and switch interlocking apparatus, the combination of a series of switch-operating rods and signal-operating rods, said rods being provided with blocks or dogs which may be intercepted by a locking-bar, a locking-bar perforated or slotted to permit the passage of the blocks or dogs through the perforations or slots when it is in its normal position, and which may intercept the blocks or dogs when it is moved from its normal position, and provided with a pin or friction-roller whereby it may be moved, said pin or friction-roller engaging a plate or frame connected with a switch-operating rod or a signal-operating rod, and a plate or frame connected with one of the rods, and having an inclined face or slot engaging said pin or friction-roller, whereby it will, when operated, move the locking-bar from its normal position to lock the other rods; substantially as described.

6. In a signal and switch interlocking apparatus, the combination of a series of switch-operating rods and signal-operating rods, said rods being provided with blocks or dogs so constructed that any one of them may, when operated, engage a locking-bar when in its normal position and move it from that normal position, and that they may be intercepted by the said locking-bar when it has been previously moved from its normal position, a locking-bar perforated or slotted to permit the passage of the blocks or dogs through the perforations or slots when it is in its normal position, and which may intercept the blocks or dogs when it is moved from its normal position, the said perforations or slots being so constructed that they may, when the locking-bar is in its normal position, neatly engage the said blocks or dogs, and blocks or dogs connected with one or more of the rods, and having inclined faces, and which may engage in perforations or slots in the locking-bar when the locking-bar is in its normal position, and any one of which, when operated and engaging in one of the said perforations or slots, shall, by means of one of its inclined faces, move the said locking-bar from its normal position to lock the other rods, and which, when the locking-bar has been previously moved from its normal position, shall be intercepted by the locking-bar; substantially as described.

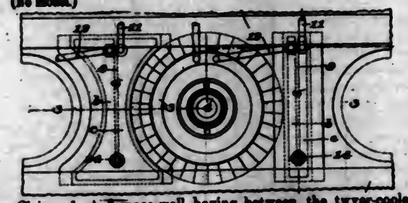
7. In a signal and switch interlocking apparatus, the combination of a series of switch-operating rods and signal-operating rods, said rods being provided with blocks or dogs so constructed that any one of them may, when operated, engage a locking-bar when in its normal position and move it from that normal position, and that they may be intercepted by the said locking-bar when it has been previously moved from its normal position, a locking-bar perforated or slotted to permit the passage of the blocks or dogs through the perforations or slots when it is in its normal position, and which may intercept the blocks or dogs, thus locking the rods to which the said blocks or dogs are connected, when it is moved from its normal position, the said perforations or slots being so constructed that they may, when the locking-bar is in its normal position, neatly engage the said blocks or dogs, and blocks or dogs connected with one or more of the said rods, and having inclined faces, and which may engage in perforations or slots in the locking-bar, and any one of which, when operated and engaging in one of the said perforations or slots, shall, by means of its said inclined face, move the said locking-bar from its normal position to lock the other rods, and having other inclined faces whereby when any one of them having been operated to move the locking-bar from its normal position that one is operated in the opposite direction, it shall move the locking-bar to its normal position, and which blocks or dogs shall, when the locking-bar has been previously moved from its normal position, be intercepted by the locking-bar; substantially as described.

8. In a signal and switch interlocking apparatus, the combination of a locking-bar having perforations or slots, the said perforations or slots having inclined or beveled ends, and a series of switch-operating rods and signal-operating rods, said rods being provided with blocks or dogs, the said blocks or dogs having faces inclined to the line of the direction of the motion of the rods, and having truncated corners, and adapted to engage neatly, when the rods to which they are connected are operated, in the perforations or slots in the locking-bar to move the said locking-bar; substantially as described.

9. In a signal and switch interlocking apparatus, the combination of a series of switch-operating rods and signal operating rods, said rods being provided with blocks or dogs having inclined faces and being so constructed that any one of them may engage in one of a series of perforations or slots in a locking-bar to move said locking-bar to lock the other rods when the rod to which it is connected is operated in one direction, and to move said locking-bar to unlock the other rods when the rod to which it is connected is operated in the opposite direction, a locking-bar having perforations or slots adapted to engage the said blocks or dogs, and adapted to be moved from its normal position by any one of the said blocks or dogs when that one is operated and engages in one of the perforations or slots, and adapted to intercept the other blocks or dogs and so to lock the rods to which they are connected when it is moved from its normal position, and mechanism engaging the said locking-bar and tending to keep the said locking-bar in its normal position; substantially as and for the purpose described.

10. In a signal and switch interlocking apparatus, the combination of a series of switch-operating rods and signal-operating rods, a locking-bar perforated or slotted to permit the engaging of blocks or dogs in said perforations or slots, blocks or dogs having inclined faces and truncated corners, and connected one with each of the said rods, and so constructed that any one of them may, when the rod to which it is connected is operated in one direction, engage in one of the perforations or slots of the locking-bar to move said locking-bar to intercept the other blocks or dogs and so lock the rods to which they are connected, and the locking-bar having been so moved, and when the rod to which the said block or dog is connected is operated in the reverse direction, to move the locking-bar to free the other blocks or dogs and so unlock the rods to which they are connected, and a counterbalance engaging the locking-bar, and, by exerting an endwise pressure on it in one direction, tending to keep it in such a position that all the blocks or dogs and the rods to which they are connected are free to be operated; substantially as and for the purpose described.

601,758. ELECTRIC LANTERN. OSCAR C. FRAHM, West New Brighton, N. Y. Filed June 28, 1897. Serial No. 642,614. (No model.)

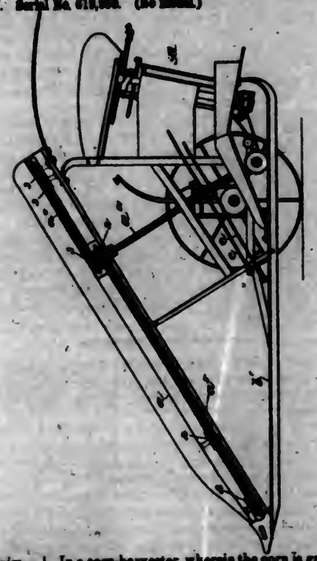


Claim.—1. A battery, comprising a casing having a removable head thereon and a depending cylindrical carbon attached to said head, an inclosed porous cup and a removable zinc contained within said cup, the said cup and the said casing adapted for respectively containing chemical compounds, the said head having a diagonal vent containing mercury leading therethrough for escape of gases, substantially as shown and described.

2. In a battery, the combination of a porous cup containing a suspended zinc, and a cylindrical carbon surrounding said zinc, and a casing inclosing the said parts, said casing having a removable head to which the said carbon is attached and from which the zinc is suspended, and a recess formed in said head for containing mercury, said chamber adapted as a vent from the battery and the mercury therein adapted for closing the outlet when the battery is tilted or inverted, substantially as shown and described.

3. A battery comprising a porous cup containing a suspended zinc, a cylindrical carbon surrounding said zinc, a casing inclosing said parts, said casing having a removable head to which the carbon is attached and from which the zinc is suspended and a recess in said head for containing mercury, said chamber adapted as a vent from the battery and the mercury therein adapted for closing the outlet when the battery is tilted or inverted; in combination with an electric lantern projected from the side of said casing and connected to the battery, substantially as shown and described.

601,759. MEANS FOR PROTECTING FURNACE-WALLS. JAMES SCOTT, Pittsburg, Pa. Filed Dec. 20, 1896. Serial No. 617,162. (No model.)



Claim.—1. A furnace-wall having between the twyer-coolers hollow buckstays set in upright position and provided with passages for a cooling medium, and a band confining the same to the furnace-wall.

2. A furnace-wall having between the twyer-coolers oblong hollow buckstays set in upright position and provided with passages for a cooling medium, and bands confining the same above and below.

3. A water-cooling box contracted at the middle portion and flaring in width toward top and bottom.

601,760. CORN-HARVESTER. CHARLES S. SHARP, Auburn, N. Y., assignor to the D. M. Osborne & Company, same place. Filed Jan. 20, 1897. Serial No. 619,998. (No model.)

Claim.—1. In a corn-harvester, wherein the corn is gathered, cut and bound on end, a laterally-confined corn-passage, a binder at the rear end thereof, a cutter crossing said passage, a rapidly-moving corn-engaging device working rearwardly along the front part of said passage, and a slowly-moving corn engaging device working rearwardly along the rear part of said passage in continuation of said rapidly-moving corn-engaging device, substantially as described.

2. In a corn-harvester, a laterally-confined corn-passage, a cutter, a rapidly-moving corn-engaging device working rearwardly along the front part of said passage approximately to a vertical plane with the cutter, and a slowly-moving corn-engaging device working along said corn-passage rearward of the cutter, substantially as described.

3. In a corn-harvester wherein the corn is gathered, cut and bound on end, a laterally-confined corn-passage, a binder at the rear and thereof, a cutter crossing said passage, two corn-engaging devices working rearwardly along said passage, one at the rear of the other, the rear one working at a slower speed than the one in front of it, and in continuation thereof, and a butt engaging device arranged below said rear corn-engaging device, which works in conjunction therewith and at substantially the same speed, substantially as described.

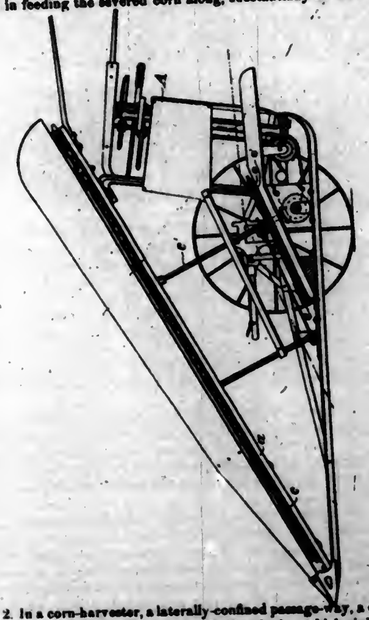
4. In a corn-harvester, a laterally-confined corn-passage, a cutter and a binder, a rapidly-moving corn-engaging device working rearwardly along the front part of said passage approximately to the cutter, a slowly-moving corn-engaging device working rearwardly along said passage from the cutter toward the binder, and a butt-engaging device arranged below said slowly-moving corn-engaging device which works in conjunction therewith and at substantially the same speed, substantially as described.

5. In a corn-harvester, a laterally-confined corn-passage, a cutter and a binder, a rapidly-moving corn-engaging device working rearwardly along the front part of said passage approximately to the cutter, a slowly-moving corn-engaging device working rearwardly along said passage from a point in advance of the cutter toward the binder, and a butt-engaging device which works from a point in advance of the cutter rearwardly toward the binder and in conjunction with said slowly-moving corn-engaging device below which it is located, said slowly-moving corn-engaging device and butt-engaging device working at substantially the speed of the machine, substantially as described.

6. In a corn-harvester, a laterally-confined corn-passage, a pair of rapidly-moving upwardly-inclined corn-engaging chains working along the front part of said passage, a pair of slowly-moving upwardly-inclined corn-engaging chains working along the rear part of said passage in continuation of the aforesaid chains, substantially as described.

7. In a corn-harvester, a laterally-confined corn-passage, a pair of rapidly-moving upwardly-inclined chains working along the front part of said passage, a pair of slowly-moving upwardly-inclined corn-engaging chains working along said passage at the rear of the aforesaid chains, and in continuation thereof, and butt-feeding devices arranged below said slowly-moving corn-engaging chains which work in conjunction therewith, substantially as described.

8. In a corn-harvester, a laterally-confined corn-passage, and two corn-engaging chains working rearwardly along said passage, one in front of the other, the front chain traveling faster than the rear chain, and a single operating-shaft for said chains having thereon two driving-wheels of different diameters around which said chains pass, substantially as described.



9. In a corn-harvester, a laterally-confined corn-passage, a pair of rapidly-moving corn-engaging chains working along the front part of said passage, the engaging portions of which are drawn taut, and a pair of slowly-moving corn-engaging chains working along the rear part of said passage, the engaging portions of which are held slack, substantially as described.

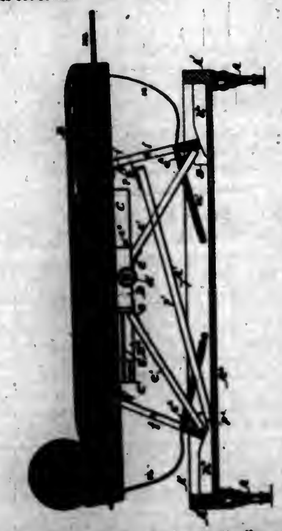
10. In a corn-harvester, a laterally-confined corn-passage, a pair of rapidly moving corn-engaging chains working along the front part of said passage, the engaging portions of which are drawn taut, and a pair of slowly-moving corn-engaging chains working along the rear part of said passage, the engaging portions of which are held slack, and reciprocating butt-feeding jaws located below said rear chains, and working conjunctively therewith to feed along the corn, substantially as described.

11. In a corn harvester wherein the corn is gathered, cut and bound on end, a laterally-confined corn-passage, a cutter crossing said passage, a binder at the rear end of said passage, a floor along said passage from the cutter to the binder, devices for continuously engaging and positively moving the corn rearward and presenting it to the cutter, yielding stalk-feeding devices working in continuation thereof from the cutter rearward toward the binder, and one or more pairs of butt-feeding jaws located beneath said yielding stalk-feeding devices which work in conjunction therewith to engage the severed corn while resting upon the floor of said passage, and convey it rearward toward or to the binder, substantially as described.

601,761. CORN-HARVESTER. CHARLES S. SHARP, Auburn, N. Y., assignor to the D. M. Osborne & Company, same place. Filed Mar. 15, 1897. Renewed Jan. 20, 1898. Serial No. 667,006. (No model.)

Claim.—1. In a corn-harvester, a laterally-confined corn-passage, a cutter, a butt-engaging device located in proximity to the cutter which engages the corn in front of said cutter and holds it while the cutter severs it, and means for operating said butt-engaging device at a speed substantially equal to the speed of the machine, combined with a rapidly-moving corn-engaging device working rearwardly along said corn-passage from front to rear, to "right" the stalks in front of the cutter, and thereafter assist in feeding them along in upright position, a butt-feeding device at the rear of said butt-engaging device, and means for operating it at a speed substantially equal to the speed of said corn engaging device, in conjunction with which it works in feeding the severed corn along, substantially as described.

2. In a corn-harvester, a laterally-confined passage-way, a cutter, a rapidly working corn righting and feeding device, which rights the corn in front of the cutter, and assists in feeding the severed corn rearward, rapidly-working butt-feeding devices at the rear of the cutter which work in conjunction with said corn-feeding device, and at substantially the same speed, and a butt-engaging device which engages the corn in front of the cutter and holds it as the cutter operates, and means for operating said butt-engaging device at substantially the speed of the machine, substantially as described.



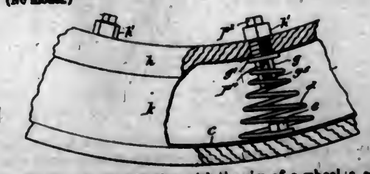
3. In a corn-harvester, a laterally-confined passage-way, a cutter crossing it substantially midway its length, and a binder at its rear end, a rapidly-moving corn righting and feeding device working substantially from end to end of said passage-way, which rights the corn in front of said cutter and feeds along the severed corn at the rear thereof, a slowly-moving butt-engaging device which engages the butts in front of and presents them to the cutter, and a rapidly-moving butt-feeding device at the rear of said butt engaging device, which works in conjunction with said corn-engaging device in feeding the severed corn toward or to the binder, substantially as described.

4. In a corn-harvester, a cutter, a butt-engaging device which engages the butts in front of and presents them to the cutter, means for operating said butt-engaging device substantially at the speed of the machine, and a butt-feeding device at the rear of said butt-engaging device which moves rearward more rapidly, substantially as described.

5. In a corn-harvester, the combination of a cutter, a butt-engaging device which engages the butts in front of and presents them to the cutter, means for operating it substantially at the speed of the machine, a rapidly-moving butt-feeding device at the rear of said cutter, and a rapidly-moving corn righting and feeding device working in advance of the cutter to right the corn and at the rear of the cutter to feed the severed corn along, substantially as described.

601,762. SURGICAL LOUNGE. SELIAH STEVENS, Boston, Mass. Filed June 18, 1897. Serial No. 641,271. (No model.)

Claim.—1. An operating-lounge composed of a base and a top, said top having hinged to it near its end holding-legs, braces hinged to the free ends of said legs, and slides hinged to the opposite ends of said braces, combined with longitudinally-arranged guides to receive said slides, and means to clamp and hold said slides in adjusted position, to thereby keep the top elevated above the base, as and for the purposes set forth.



2. The top part provided with a longitudinally-arranged guiding-cleat, two slides cooperating with different sides of the said cleat, and blocks D located at the outer sides of said slides, braces attached to said slides, and legs hinged to the said top part and to the said braces, and a base-frame on which the lower ends of said legs rest, combined with means to move said blocks to clamp the said slides and hold them, substantially as described.

3. The top part provided with a longitudinally-arranged guiding-cleat, two sides cooperating with different sides of the said cleat, and blocks D located at the outer sides of said slides, braces attached to said slides and legs hinged to the said top part and to the said braces, and a base-frame having blocks on which said legs slide, and pins to engage and hold the said legs when in their elevated positions, combined with means to move said blocks to clamp the said slides and hold them, substantially as described.

4. The top part provided with a longitudinally-arranged guiding-cleat, two slides cooperating with different sides of the said cleat, and blocks D located at the outer sides of said slides, braces attached to said slides, legs hinged to the said top part and to the said braces, and a base-frame having tracks on which said legs slide and pins to engage and hold the said legs when in their elevated positions, and locking devices for said legs, substantially as described.

5. An operating-lounge composed of a base, and a top, said top having connected to it legs and slides, and braces attached to said slides, combined with means to guide and clamp the said slides when it is desired to retain the top part of the lounge elevated for an operating-lounge, and a link connecting said base and one of said legs, substantially as described.

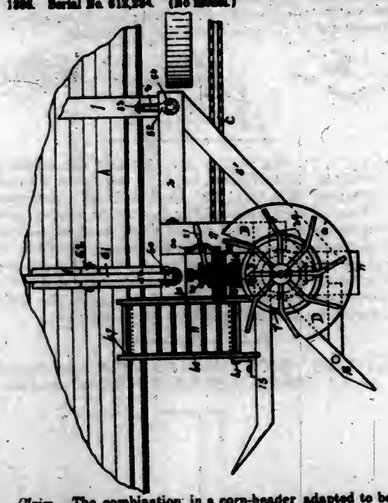
601,763. TIRE. CHARLES TAYLOR, Montreal, Canada, assignor of two-thirds to George Saunderson, same place, and George Plunkett Magann, Toronto, Canada. Filed Sept. 14, 1896. Serial No. 606,795. (No model.)

Claim.—1. In combination with the rim of a wheel, a series of guides secured thereto, a series of sections adjustable longitudinally

of said guides, a series of helical springs one end of each of which takes about one of said guides and bears upon one of said adjustable sections and the other end of each being connected to a tread, for the purpose set forth.

2. In combination with the rim of a wheel, a tread and an annulus located inside of and in contact with said tread, a series of guides secured to said tread, a series of sections adjustable longitudinally of said guides, a series of helical springs one end of each of which takes about one of said guides and bears upon one of said adjustable sections and the other end of each being connected to said annulus and a covering for said springs consisting of a pair of separate strips, the inner side edges whereof are connected to said rim and the outer side edges confined between said annulus and tread, for the purpose set forth.

3. In combination with the rim of a wheel, a series of guides carried by said rim, a series of bearing-sections carried by said guides and adjustable longitudinally thereof, a series of helical springs located between said rim and tread and each adapted to bear at one end upon the inside of said tread and having the outer end thereof encircling the end of one of said guides and bearing upon said adjustable bearing-section and means for adjusting said bearing-sections, for the purpose set forth.



4. In combination with the rim of a wheel such rim having openings therethrough, a series of guides each consisting of a slitted tubular section provided with a rigid collar and having one end screw-threaded and adapted to project through the openings in the rim to receive a retaining-nut thereon, a portion of the opening through said tubular section being diminished to form a shoulder; a bolt having one end projecting through said diminished opening and finished in a squared head; a collar formed rigidly upon said bolt; the other end of said bolt being screw-threaded, a collar adapted to be screwed upon said bolt and having radially projecting arms passing through the slits in said tubular section, a series of helical springs one end of each of which takes about one of said tubular guides and bears upon the said arms and their other ends being connected to a tread, and a covering for said springs connected to said rim and to said tread, for the purpose set forth.

5. In combination with the rim of a wheel such rim having openings therethrough, a series of guides each consisting of a slitted tubular section provided with a rigid collar and having one end screw-threaded and adapted to project through the openings in the rim to receive a retaining-nut thereon, a portion of the opening through said tubular section being diminished to form a shoulder; a bolt having one end projecting through said diminished opening and finished in a squared head; a collar formed rigidly upon said bolt; the other end of said bolt being screw-threaded; a collar adapted to be screwed upon said bolt and having radially-projecting arms passing through the slits in said tubular section, a series of helical springs one end of each of which takes about one of said tubular guides and bears upon said arms, and their other ends being connected to a tread, and a covering for said springs consisting of a pair of separate strips, the side edges whereof are connected one to said rim and the other to said tread, for the purpose set forth.

6. In combination with the rim of a wheel such rim having openings therethrough, a series of guides each consisting of a slitted tubular section provided with a rigid collar and having one end screw-threaded and adapted to project through the openings in the rim to receive a retaining-nut thereon, a portion of the opening through said tubular section being diminished to form a shoulder; a bolt having one end projecting through said diminished opening and finished in a squared head; a collar formed rigidly upon said bolt; the other end of said bolt being screw-threaded; a collar adapted to be screwed upon said bolt and having radially-projecting arms passing through the slits in said tubular section, a series of conical helical springs one, the smaller, end of each of which takes about one of said tubular guides and bears upon the said arms and their other ends being connected to a tread, and a covering for said springs connected to said rim and to said tread, for the purpose set forth.

7. In combination with the rim of a wheel, each rim having openings therethrough, a series of guides each consisting of a slitted tubular section provided with a rigid collar and having one end screw-threaded and adapted to project through the openings in the rim to receive a retaining-nut thereon, a portion of the opening through said tubular section being diminished to form a shoulder; a bolt having one end projecting through said diminished opening and finished in a squared head; a collar formed rigidly upon said bolt; the other end of said bolt being screw-threaded; a collar adapted to be screwed upon said bolt and having radially-projecting arms passing through the slits in said tubular section, a series of conical helical springs one, the smaller, end of each of which takes about one of said tubular guides and bears upon the said arms and their other ends being connected to a tread, and a covering for said springs consisting of a pair of separate strips the side edges whereof are connected one to said rim, and the other to said tread, for the purpose set forth.

601,764. KAFIR-CORN HEADER. JOSEPH B. TILLEY, JOHN B. TILLEY, and LEAFBERRY F. TILLEY, Keighley, Kans. Filed Nov. 16, 1896. Serial No. 612,284. (No model.)

Claim.—The combination, in a corn-header adapted to be used in connection with an ordinary wagon, of the following instrumentalities, to wit: a supporting-frame adjustably secured to said wagon, the gathering-arms, 15 and 16, secured to said frame, the main operating-shaft, B, suitably journaled within said supporting-frame, the clutch-section, 20, working upon said shaft, said clutch-section being actuated by the lever, 21, the loose chain-pulley, 22, secured to said shaft adjacent to said clutch-pulley, said loose chain-pulley being in chain connection with one of the wheels of said wagon, the approximately circular trough, D, positioned above said shaft, B, the flange, c, forming part of said trough, the rotating cutting-knife, F, within said trough, said knife projecting beyond the union of said gathering-arms, 15 and 16, the shaft, 30, secured to said cutter and further being provided with the bevel-gear, 31, the reel, 35, upon said shaft, 30, the elevator, H, positioned below said reel, 35, the bevel gear, 36, secured to the shaft, B, meshing with said gear, 31, the spool, 40, secured to said shaft, B, the shaft, 41, positioned at right angles above said spool, 40, said shaft, 41, being provided with a spool, 43, and the belt, 44, working upon said spools, 40 and 43, all arranged to operate substantially in the manner set forth.

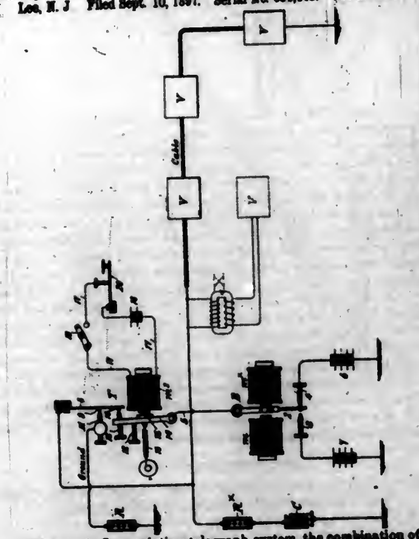
601,765. PLOW-HANDLE CLAMP. JAMES G. WELLS, Jackson, Tenn. Filed Nov. 8, 1897. Serial No. 657,736. (No model.)

Claim.—1. The combination with the beam and the handles of a plow, of a clamp consisting of a clip-plate for each handle, each plate having studs at its four corners, embracing the handles, one of the studs at the upper edge of the plate at the rear sides of the handles and one of the studs at the lower edge of the plate at the front sides of the handles entering and bolting with a bore in the opposite sides of the beam, and a nutted bolt binding the clip-plates, the handles and the beam.

2. As a new article of manufacture a plow-handle clip-plate formed with a central hole, a stud at its four corners, two of said studs at diagonal corners being longer than the other two and the said longest studs being a greater distance apart than the other two substantially as described.

601,766. RAILROAD-TIE PLATE. WILLIAM J. ALLEN, Clarendon, Ark. Filed July 3, 1897. Serial No. 643,407. (No model.)

Claim.—A railroad-tie plate, consisting of a rectangular plate, having a turned-up lip cut from the body of the plate and designed



to engage the base-flange of a rail, an aperture for a spike in alinement with the lip, and two parallel V-shaped ribs located on the reverse side of the plate from the lip, extending from end to end of the plate near the side edges thereof, and adapted to be embedded in the tie lengthwise of the grain, substantially as described.

601,767. COMPOSITION FOR COLORING AND PRESERVING WOOD, &c. McKENZIE ARNN, Bristol, Va., assignor to A. H. Bonnebrd, same place. Filed Feb. 27, 1897. Serial No. 626,408. (No specimens.)

Claim.—The above-described composition for coloring, preserving and strengthening timber consisting of one hundred pounds lime, one hundred pounds salt, ten pounds alum, ten pounds of blue-stone, ten pounds of copperas, two pounds litharge, five pounds gum-arabic, ten gallons of kerosene-oil, mixed in clear water and stirred well, with two pounds metallic lead, five pounds metallic zinc, and one pound metallic copper dissolved in ten gallons nitric acid.

601,768. PRINTING-TELEGRAPH SYSTEM. JOHN BURRY, Fort Lee, N. J. Filed Sept. 10, 1897. Serial No. 651,165. (No model.)

Claim.—1. In a printing-telegraph system, the combination of a line, a receiver provided with printing and polarized type-controlling electro magnets operated by the line-current, an automatic current-reverser in said line intermediate the source of electrical energy and said receiver and adapted to be held closed while a transmitter-key is held closed, a "ground" through non-inductive resistance normally disconnected from the line and located between the said reverser and said receiver, and a two-way switch in said line between said reverser and said receiver arranged to throw the battery off and on and simultaneously to connect and disconnect the said "ground" and the receiver end of the line, substantially as described.

2. In a printing-telegraph system, the combination of a line, a receiver provided with printing and polarized type-controlling electro magnets operated by the line-current, an automatic current-reverser in said line intermediate the source of electrical energy and said receiver and adapted to be held closed while a transmitter-key is held closed, a "ground" through non-inductive resistance normally disconnected from the line and located between the said reverser and said receiver, and a two-way switch in said line between said reverser and said receiver arranged to throw the battery off and on and simultaneously to connect and disconnect the said "ground" and the receiver end of the line, with a condenser connected to said line, substantially as described.

3. In a printing-telegraph system, the combination of a line, a receiver provided with printing and polarized electro magnets operated by the line-current and a slipping type-controlling escapement operated by said polarized magnets, an automatic current-reverser in said line intermediate the source of electrical energy and said receiver and adapted to be held closed while a transmitter-key is held closed, a "ground" through non-inductive resistance normally disconnected from the line and located between the said reverser and said receiver, and a two-way switch in said line between said reverser and said receiver arranged to throw the battery off and on and simultaneously to connect and disconnect the said "ground" and the receiver end of the line, substantially as described.

4. In a printing-telegraph system, the combination of a line, a receiver provided with printing and polarized electro magnets operated by the line-current and a slipping type-controlling escapement operated by said polarized magnets, an automatic current-reverser in said line intermediate the source of electrical energy and said receiver and adapted to be held closed while a transmitter-key is held closed, a "ground" through non-inductive resistance normally disconnected from the line and located between the said reverser and said receiver, and a two-way switch in said line between said reverser and said receiver arranged to throw the battery off and on and simultaneously to connect and disconnect said "ground" and the receiver end of the line, with a condenser connected to said line, substantially as described.

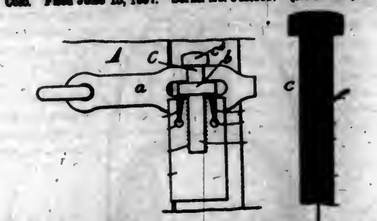
5. In printing-telegraph systems employing a single line or wire for transmitting and printing, the method of transmitting and printing characters and repeating any character alongside itself which consists in transmitting and printing characters by means of a resonant alternating line-current, and in transforming the electrical conditions from the resonant state to a state of slow discharge and back to the resonant state to repeat a character alongside itself, substantially as described.

6. In a printing-telegraph system, the combination of an electro-magnet, a battery and circuit for energizing said magnet, a key in said circuit, an armature-lever 14 for coaction with said magnet and provided with a contact-point 13, a spring-arm 8 provided with contact-points 9 10, a ground through non-inductive resistance provided with a contact-point 11, the batteries 6, 7 and current-reverser B, the line 5 connected with arm 14, and the line provided with receivers and connected with arm 8 and with a condenser C, substantially as described.

601,769. PILLOW-BLOCK. WILLIAM J. DALY, Rankin, Pa. Filed June 10, 1897. Serial No. 640,161. (No model.)

Claim.—1. A pillow-block having a concave seat formed therein, a block having a convex face engaging therewith, and a bearing-block separate from and supported on said block, substantially as set forth.

2. In a pillow-block, the combination of a main frame, a stationary side piece extending up therefrom, a movable side piece opposite said stationary side piece and extending up from said frame, bearing-blocks between said side pieces, and a top piece secured to said side pieces, substantially as set forth.



3. In a pillow-block, the combination with a suitable bed-plate having an aperture therein, of a main frame resting thereon, a stationary side piece on said frame, a movable side piece having a foot entering said aperture in said bed-plate, and a top piece secured to said side pieces, substantially as set forth.

4. In a pillow-block, the combination with a suitable bed-plate having an aperture therein, of a main frame resting thereon, a stationary side piece on said frame, a movable side piece passing down through an opening in said frame, a foot on said movable side piece entering said aperture in said bed-plate, said foot engaging the inner face of said frame, and a top piece secured to said side pieces, substantially as set forth.

5. In a pillow-block, the combination with a suitable bed-plate, of a main frame resting thereon and adapted to move transversely, a stationary side piece on said frame, a movable side piece, bearing-blocks between said side pieces, and a top piece secured to said side pieces, substantially as set forth.

6. In a pillow-block, the combination with a suitable bed-plate having an aperture therein, of a main frame resting thereon, a stationary side piece, a movable side piece passing through an opening in said frame, said movable side piece having a foot entering said aperture in said bed-plate, said foot engaging the inner face of said frame, said frame and movable side pieces having lugs thereon, a brace-block engaging said lugs, and a top piece secured to said side pieces, substantially as set forth.

601,770. SEAL-BOLT. FREMONT C. DOERNBADER, Colorado Springs, Colo. Filed June 15, 1897. Serial No. 640,895. (No model.)

Claim.—1. In a seal-lock, the combination with a seal having a plurality of transversely-disposed webs, of a locking-pin provided with a longitudinally-disposed slot and teeth in the walls of the slot for engagement with the webs of the seal.

2. In a seal-lock, the combination of a locking-pin provided with a longitudinally-disposed toothed slot, a plurality of hooks projecting from a lock member, and a seal having transverse webs for engagement with the slot-teeth and perforations for engagement with the hooks.

3. In combination with a lock as described, of a pin provided with a longitudinally-disposed slot the walls of which are provided with alternately-disposed ratchet-shaped teeth, and a seal formed of thin flexible material provided with incisions forming a plurality of webs for engagement with the teeth of the slot, substantially as described.

4. In a seal-lock of the character described, the combination with a lock member carrying hooks, of a pin having a longitudinally-disposed toothed slot, and a seal of thin sheet material having perforations for engagement with the hooks, and webs for engagement with the slot-teeth, and having a space for the reception of impressions made in the manner and for the purpose set forth.

601,771. BALL OR COP OF TWINE. GEORGE H. ELLIS and JOHN F. STEWARD, Chicago, Ill. Filed Apr. 20, 1895. Serial No. 547,486. (No model.)

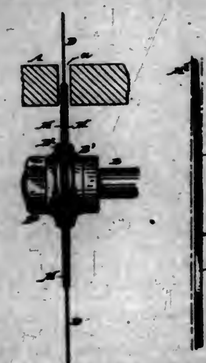
Claim.—1. A cylindrical cop or ball made up of superposed layers or courses, each layer consisting of coils wound spirally from end to end of the cop in reverse directions, the angle of the coils relative to the axial line of the cop being the same in all the layers, and the pitches of the coils being so arranged in the several layers as that the coils in each layer will form a bond for those in the layer beneath.

2. A cylindrical cop or ball made up of superposed layers or courses, each layer consisting of coils wound spirally from end to end of the cop in reverse directions, the angle of the coils relative to the axial line of the cop being the same in all the layers, and the pitches of the coils of any given layer being greater than those of the layer beneath it so as to form a bond for the latter.

3. A cylindrical cop or ball made up of superposed layers or courses, each layer consisting of coils wound spirally from end to end of the cop in reverse directions, the angle of the coils relative to the axial line of the cop being the same in all the layers, and the pitches of the coils in any given layer being greater than those of the underlying layer, and the number of pitches in the several layers diminishing as the diameter of the cop increases.

4. A cylindrical cop or ball made up of superposed layers or courses, each layer consisting of coils wound spirally from end to end of the cop in reverse directions, the angle of the coils relative to the axial line of the cop being the same in all the layers, and the pitches of the coils in any given layer being greater than those of the underlying layer, and the number of pitches in the several layers diminishing as the diameter of the cop increases, the number of pitches in the outer or finishing layer being divisible into the length of the cop in whole or half numbers only.

601,772. WRENCH. THOMAS FORSHEE, New Ulm, Minn. Filed Mar. 26, 1896. Renewed Jan. 26, 1898. Serial No. 668,494. (No model.)

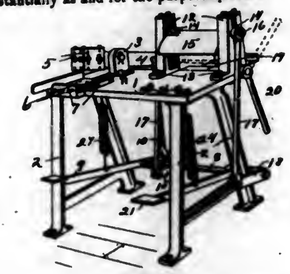


Claim.—1. The combination with the fixed jaw and its shank, of the movable jaw, the arms pivoted on its shank, the dog carried by the said arms, and the eccentric lever mounted on the dog, as set forth.

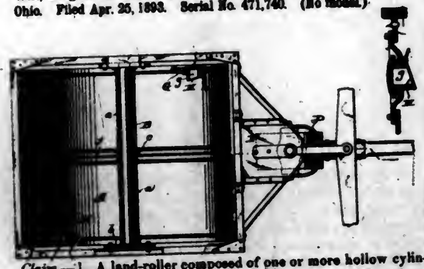
2. The combination with the fixed jaw and its shank, of the movable jaw, the arms pivoted on the shank of the movable jaw, the dog carried by the arms, the eccentric lever mounted on the dog, and the springs on the shank of the movable jaw acting on the said arms, as set forth.

3. The wrench described consisting of the fixed jaw, its toothed shank, the movable jaw, its shank, the guide thereon, the arms pivoted on the shank of the movable jaw, the springs on the shank of the movable jaw and acting on said arms, the toothed dog pivotally mounted on the arms, and the eccentric lever pivoted on the pivot of the dog, all substantially as and for the purpose specified.

601,773. MEANS FOR STIFFENING CIRCULAR SAWS. CHAS. FOSS, Rutherford, N. J. Filed May 29, 1897. Serial No. 638,681. (No model.)



Claim.—The saw A, mandrel B, and securing means B', B², B³, in combination with the disks M of less diameter than the saw, applied one on each face of the latter, and each having the central opening to matching to and receiving said mandrel, the said disks being slightly concaved on the faces adjacent to the saw and corresponding each to the other in diameter, thickness, temper, and concavity, and flattened and compressed into close contact with said saw over the whole covered surface to maintain the saw in a true plane, all arranged to serve substantially as and for the purpose herein specified.



601,774. MACHINE FOR FOLDING SLIP-JOINTS FOR RAVER-TROUGHS. ROBERT P. FOWLER, Canton, Ohio, assignor of one-half to Burnhard Dick, same place. Filed Mar. 26, 1897. Serial No. 630,194. (No model.)

Claim.—The combination of the bed-plate 1 supported upon standards, the housings 12 secured to the bed-plate 1, the combined ham-

mer and gage 15 movable vertically and provided with the recess 22, the folding-bar 19 journaled to the bed-plate and provided with the operating-lever 20, the bars 17, connected at their upper ends to the bearings 16, and at their lower ends to the arms 18, the shaft 8 provided with the foot-lever 21, and the spring 24 connected to the foot-lever, substantially as and for the purpose specified.

601,775. LAND-ROLLER. WILLIAM F. GOODHUE, Milwaukee, Wis., assignor to the Addyston Pipe and Steel Company, Cincinnati, Ohio. Filed Apr. 25, 1893. Serial No. 471,740. (No model.)

Claim.—1. A land-roller composed of one or more hollow cylinders each having a filling-opening in the end and provided with an outwardly-closing check-valve in said opening and a cap for closing said opening outside of the check-valve, substantially as and for the purposes set forth.

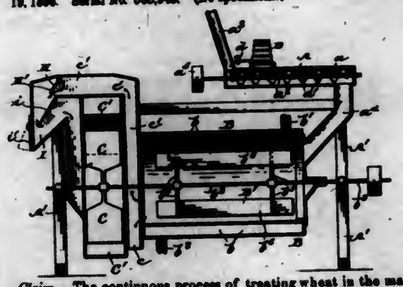
2. A land-roller composed of one or more hollow cylinders, each of which has a vent-opening and is provided in the end near the periphery with an aperture and with an inwardly-opening valve adapted to permit the inflow but prevent the outflow of liquid therefrom, and a cap for closing said aperture outside of said valve, substantially as and for the purposes set forth.

3. In a land-roller, the combination of a suitable frame, a hollow cylinder mounted and arranged to turn therein, a valve arranged to close outwardly over an opening in the end of said cylinder, and a vent-opening between said valve and the periphery of the cylinder, substantially as and for the purposes set forth.

4. In a land-roller, the combination of a suitable frame, a hollow cylinder journaled therein and formed or provided in one end near its periphery with a sleeve open at its ends outside and inside of said cylinder, the outer end of said sleeve being screw-threaded and provided with a screw-cap, and a valve hinged to the inside of the cylinder at one side of said sleeve and provided with a projection arranged to limit its opening, substantially as and for the purposes set forth.

5. In a land-roller, the combination of one or more hollow cylinders, each having a filling-opening and a separate vent-hole and provided with an outwardly-closing check-valve in said filling-opening, substantially as and for the purposes set forth.

601,776. CORK-PROTECTOR. CHARLES W. MACKEY, Moravia, N. Y. Filed Aug. 26, 1896. Renewed Nov. 3, 1897. Serial No. 657,204. (No model.)

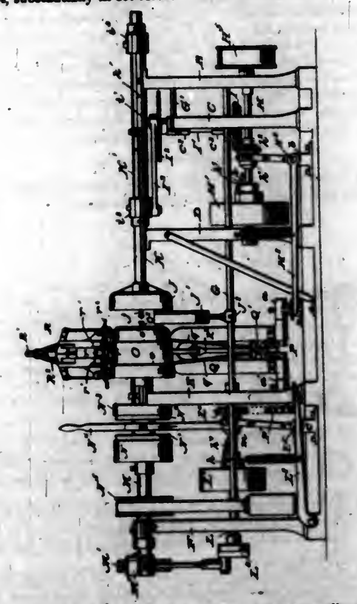


Claim.—1. A corkscrew having an extension adapted to lie against the exterior of the body of a bottle so as to be engaged by the label when the corkscrew is inserted in the stopper, substantially as described.

2. A corkscrew provided with oppositely-projecting extensions adapted to lie against the body of the bottle at substantially diametrically opposite points, so as to be engaged by the label when the latter is applied to the bottle and the corkscrew inserted in the stopper, substantially as described.

3. The combination with a stopper-protecting device adapted to fit over a cork and embrace the body of the bottle so as to be engaged by the label, of a corkscrew permanently secured thereto and adapted to engage the stopper, substantially as described.

601,777. PROCESS OF TREATING WHEAT IN MANUFACTURING FLOUR. ARTHUR F. CHEVERTON, Winneconne, Wis. Filed Mar. 19, 1896. Serial No. 583,943. (No specimens.)



Claim.—The continuous process of treating wheat in the manufacture of flour which consists essentially in first rapidly moving the wheat and slightly moistening it in transit with water without soaking the bran, next passing the wheat through a polisher and at the same time subjecting it to dry heat and mutual attrition whereby it is dried, seasoned, and polished, and finally passing the wheat thus prepared, in the bran, to the first break-rolls, substantially as described.

601,778. BASKET-MAKING MACHINE. ROGER R. REED, Douglas, Mich., assignor of two-thirds to Elmer E. Wood, D. Milton Gerber, and Cornelius Gerber, same place. Filed May 27, 1897. Serial No. 638,247. (No model.)

Claim.—1. In a basket-making machine, the combination with a form mounted on a shaft connected with mechanism for imparting an intermittent rotary movement or a continuous rotary movement thereto, a shaft journaled in line therewith and provided with a hood or cap, means for moving the same over the form so as to bend and retain the basket-splints thereon, of a stapling-machine mounted on a swinging support so that it can be moved into operative position over the form or to one side of the same, when placing the splints on the form or removing the completed basket therefrom.

2. In a basket-making machine, a shaft having a basket-form carried thereby, a cap or hood carried by a shaft on a line therewith, said shaft being mounted so as to be moved to and from the form, a stapling machine mounted on a swinging support, the driving-shaft of the stapling-machine being in gear with the driving mechanism for the shaft upon which the form is mounted, said mechanism embodying a pawl and ratchet for imparting an intermittent rotary motion to the form and gearing to operate the stapling-machine when the form is at rest, substantially as shown and for the purpose set forth.

3. In a basket-making machine, the combination with a shaft having a basket-form attached thereto, mechanism for imparting to said shaft and basket-form an intermittent rotary motion, a pulley mounted on the shaft so as to impart when it positively engages the shaft a continuous rotary movement, a second shaft mounted on a line with the shaft carrying the form, the same being provided with a hood or cap, and means for supporting the shaft so that it may be moved to place the hood or cap partially over the form; together with a stapling-machine supported so as to be moved to an operative position over the form or to one side of the same, the stapling-machine being connected with the shaft carrying the form so that a downward movement of the staple-drivers will be effected when the form is at rest, substantially as set forth.

4. In a basket-machine, the combination of a horizontally-mounted shaft carrying a basket-form, of a shaft mounted on a line therewith and provided with a cap or hood for bending the basket-splints over the form, said shaft being connected with means for moving the same longitudinally, the basket-form having its end adjacent to the hood or cap concave, and a spring-projected rod carried by the shaft upon which the hood or cap is mounted for bending the splints in the concave portion of the basket-form, for the purpose set forth.

5. In a basket-making machine, the combination with the shafts one carrying a form having a concave end and the other a cap or hood, the shaft carrying the cap or hood being movable longitudinally to and from the form, of spring-projected rods carried by the shafts so as to be on a line with each other to provide means for holding the splints and forcing them in the concave portion of the basket-form prior to the engagement of the hood or cap with said splints, said hood or cap bending and holding the splints over the form while the bands are being applied thereto, the spring-projected rod carried by the shaft upon which the form is mounted projecting the basket from the form when the cap is moved away therefrom, for the purpose set forth.

6. In a basket-making machine the combination with shafts one having a form with concave end and the other a splint-bending cap mounted thereon, of spring-projected rods carried by the shafts and positioned centrally with respect to the form and cap, one of the rods having means for limiting its inward movement so that a part thereof will be positively projected to force the splints into the concave end of the basket-form prior to the bending of the splints over the form by the cap, for the purpose set forth.

7. In a basket-making machine the combination with a basket-form mounted on a horizontal shaft, said form having shoulders to provide inner hoop-bearings, the outer end of the form being concave, a hood or cap mounted on a shaft having means for moving the shaft so as to position the hood or cap over the form, the shafts upon which the form and hood or cap are mounted each carrying spring-projected rods which hold the splints centered, one of the rods having means for holding the same positively projected so as to bend the splints within the concave portion of the form, the hood or cap subsequently bending the splints over the form, substantially as shown and for the purpose set forth.

8. In a basket-machine, the combination with a form having a concave end, of a hood or cap adapted to bend the splints over the form, a rod carried by the shaft upon which the hood is mounted, a spring for projecting said rod and a collar or stop to limit the inward movement of the rod to provide a projecting portion which will force the splints into the concave portion of the form.

9. In a basket-making machine, the combination of a shaft mounted so as to be rotatable in bearings, the bearings being supported so as to have a longitudinal movement, a hood or cap for the purpose set forth mounted on one end of the shaft, a lever fulcrumed on a fixed frame and provided with a projecting portion for engagement with the sliding frame having the bearings and means substantially as shown for effecting the movement of the sliding frame for the purpose set forth.

10. In a basket-making machine, the combination with a form, of a cap or hood mounted on a shaft, means for moving the shaft and hood to and from the form embodying a sliding frame with bearings in which the shaft is journaled, a pitman connected to the sliding frame and to an arm or disk, a vertical shaft on which said arm or disk is mounted, a gear-wheel on the lower end of said shaft; together with a horizontal shaft having a driving-pulley loosely mounted thereon, a sliding block for throwing a clutch of the driving-pulley in engagement with the shaft and a lever for moving said clutch, substantially as shown.

11. In a basket-making machine, the combination with a form and hood having spring-projected splint-holding bars or rods, of a centering device positioned beneath the form and cap so as to occupy an intermediate position between the same with which the ends of the splints are adapted to engage, substantially as shown.

12. In a basket-making machine having a form and hood, of a segmental plate supported beneath the same to serve as a centering device for the splints, together with spring-projected splint-holding bars carried by the shafts upon which the form and hood are mounted so as to engage with the center of the splints, substantially as shown.

13. In a basket-making machine having a form and hood or cap, of a segmental centering device supported beneath the same said centering device having on one of its edges an upwardly-projecting flange, the supports for the form and hood having spring-actuated splint-holding rods beneath which the centering device is positioned for the purpose set forth.

14. In a basket-making machine, the combination with the shafts having hollow ends upon which are mounted a form and hood for bending the splints over the same, spring-actuated splint-engaging rods carried by the hollow shafts; together with a segmental centering device adjustably mounted upon the frame below the splint-holding rods for the purpose set forth.

15. In a basket-making machine, the combination with a form and means for holding splints thereon and imparting a rotary movement thereto, of a stapling-machine mounted on a swinging support so as to be moved into operative position over the form, said stapling-machine having a pair of staple-drivers maintained at opposing angles with each other and with the grain of the hoops and splints.

16. In a basket making machine, the combination with a stapling-machine mounted on a movable support the same having in front of the staple-drivers thereof hoop-rollers, of a form mounted on a shaft said form having shoulders against which the inner hoops of the basket abut positioned so that the inner hoops will be beneath the staple-drivers and hoop-rollers adjacent thereto when the stapling-machine is moved over the form, for the purpose set forth.

17. In a basket-making machine, the combination with a form and a cap for holding the splints thereon, and means for imparting an intermittent rotary movement to the form, of a stapling-machine having a pair of rollers for the exterior hoops and mechanism for driving two staples simultaneously when the form is at rest, the shaft carrying the form and the driving-shaft of the stapling machine being in gear with each other, substantially as shown and for the purpose set forth.

18. In a basket-making machine, the combination with a shaft having means for imparting an intermittent rotary movement thereto, a form mounted on said shaft, a stapling machine supported so as to be moved to one side of the form to provide room to bend the splints upon the form, the stapling-machine being moved over the same when in operative position, a cap or hood for holding the splints on the form and mechanism substantially as shown for operating the stapling-machine when the form is at rest for the purpose set forth.

19. In combination with a basket-making machine having a form and means for holding the basket-splints thereon, of a stapling-machine mounted on a swinging support, a foot lever or brake for moving the stapling-machine above the form; together with means for throwing the driving mechanism which operates the stapling-machine in gear with the shaft upon which the form is mounted, substantially as shown.

20. In a machine for making baskets from splints and hoops, a form over which the splints are bent, a cap for bending and holding the splints thereon, in combination with a stapling-machine which is movable at right angles to the longitudinal axis of the form, rollers carried by the frame of the stapling-machine in advance of the staple-driving mechanism and a cross-bar having upwardly-projecting guide-pins, supported so as to be positioned in advance of the rollers, substantially as shown and for the purpose set forth.

21. In a basket-making machine, the combination with a form and a cap or hood for holding the splints thereon, the shaft upon which the form is mounted carrying a ratchet-wheel, means for turning the ratchet-wheel, said shaft also carrying a friction-brake to provide means for holding the shaft against rotation; together with a stapling-machine and means for operating it from the driving-shaft to which the shaft carrying the form is geared so that the staples will be driven when the form is at rest for the purpose set forth.

22. In a basket-making machine, the combination of a pair of shafts in alinement with each other, one of the shafts having a basket-form mounted thereon, the other shaft carrying a cap or hood for bending and holding the splints upon the form, means for imparting an intermittent rotary movement to the shaft carrying the form, a stapling-machine in gear with a main driving-shaft, said main driving-shaft also being connected to the shaft carrying the form, means for disengaging the driving-pulley from the main driving-shaft, a pulley mounted on the shaft carrying the form and a clutch adapted to be placed in engagement therewith, so as to effect a continuous rotary movement of the form without operating the staple-driving mechanism, the parts being organized and combined substantially as shown and for the purpose set forth.

23. In a basket-making machine, the combination of an intermittently-driven shaft carrying a form, of a shaft mounted so as to be movable to and from the form, a hood carried by said shaft, driving-shafts as H, L, and means for connecting said shafts with the shafts carrying the form and hood, pulleys loosely mounted on the shafts L, H, and foot-levers having their ends projecting toward each other, said foot-levers being connected to rock-shafts having arms for engagement with slides mounted on the shafts L, H, so that when the foot-levers are depressed the slides will be moved to engage clutches on the shafts so that said pulleys will be positively connected with the shafts; together with an arm pivotally attached to a crank-shaft, said arm carrying stapling mechanism, a foot-lever for bringing the arm forward so that the stapling mechanism will be in operative position and gearing for connecting the crank-shaft to the shaft L, the parts being combined and organized substantially as shown and for the purpose set forth.

24. In a basket-making machine the combination with the form and means for holding splints thereon and imparting an intermittent rotary motion to the form and splint-holder, of a duplex stapling-machine having separate plungers and staple-forming devices, guide-rollers and wire-holders, motion being imparted to the operative parts by a single rod which is reciprocated from the shaft which drives the shaft carrying the form; the stapling-machine also carrying in front of the staple-inserting plungers, flanged rollers for the hoops and an intermediate resilient bar carrying a cross-bar with upwardly-projecting pins, the parts being organized substantially as shown and for the purpose set forth.

25. In a basket-making machine, the combination with a form, and a hood or cap for bending the splints and holding them on the form, the form and the hood or cap being mounted on independent shafts, means for moving longitudinally one of the shafts so that it will turn in unison with the shaft carrying the form, of a stapling-machine carried by a swinging support, so as to be positioned away from the form and brought over the form, the basket form serving as an anvil for the staple-drivers, substantially as set forth.

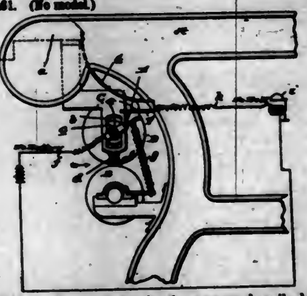
26. The combination in a basket-making machine, having a driven shaft to which is imparted an intermittent rotary movement, a basket-form carried by said shaft and a cap or hood for holding the basket-splints thereon, of a stapling-machine mounted on a swinging support, the driving-shaft of the stapling-machine being geared and ordinately arranged to operate the staple-drivers which are indirectly connected with said shaft so that the downward movement thereof will be between the impulses of the basket-form, the mechanism embodying a driving-shaft with which the driving-shaft of the form and the driving-shaft of the stapling-machine are geared for the purpose set forth.

27. In combination with the basket-making machine, a staple making and driving mechanism, comprising a base-frame with stapling mechanism arranged at opposing angles with respect to the longitudinal axis of the basket-form, the base-frame having a centrally-projecting lug upon which are mounted hoop-rollers, a plate carried by the lug so as to project in advance of the hoop-rollers, said plate having upward-projecting pins; together with a reciprocating frame the downward movement of which actuates the mechanism which forms and drives the staples, substantially as shown.

28. In combination with a basket-making machine, a stapling-machine having a pivotally-supported base-frame with staple making and driving mechanisms carried thereby so as to be at opposing angles relative to the longitudinal axis of the basket-form, an operating-rod which passes through and is guided by the base frame, a frame mounted on said shaft so as to reciprocate therewith said frame carrying depending members which actuate the staple making and driving mechanisms and means in engagement with each other for rotating the basket-form and reciprocating the operating-rod of the stapling mechanism, substantially as shown and for the purpose set forth.

29. In combination with a basket-making machine, a duplex stapling-machine comprising a lower base-frame, the portions which carry the staple making and driving mechanisms being arranged at opposing angles with each other, a driving-rod for operating both staple making and driving mechanism, said rod passing through the base-frame and being guided thereby, a reciprocating frame carrying pawls for operating the feed-wheels, latches for engagement with the staple-formers, and staple-drivers connected to the upper reciprocating frame, substantially as shown and for the purpose set forth.

601,779. CHALK-HOLDER. GEORGE P. ROBBINS, Fremont, Ohio. Filed Mar. 2, 1897. Serial No. 626,760. (No model.)



Claim.—1. A chalk-holder consisting of a conical body B, a longitudinal groove in the wall thereof and a strap or band secured in said groove and of such length as to hold said holder to the hand, as set forth.

2. A chalk-holder consisting of a conical body B, a band or strap secured thereto and means for holding said strap or band to the holder, in combination with a chalk fitting into said holder and held therein by friction.

3. A chalk-holder consisting of a conical body B, a longitudinal groove in the wall thereof entering throughout its entire length, and an elastic strap or band secured in said groove, and of such length as to hold said holder to the hand in combination with a conical piece of chalk or other suitable material, held in said body B by binding against the inner wall thereof and against the elastic band, as set forth.

601,780. APPARATUS FOR DETECTING WRINKLES IN CLOTH. THOMAS ROWE, Woonsocket, R. I. Filed Sept. 13, 1897. Serial No. 651,491. (No model.)

Claim.—In the apparatus for the purpose described, the combination of the main frame, a feed-roll journaled in the main frame, hanger arms or supports connected with the main frame and disposed above the feed-roll and having vertically-elongated slots, the bearing-blocks arranged in said slots, screws taking through threaded apertures in the hanger-arms and adjustably supporting the bearing-blocks, the normally idle detector-roll having journals arranged in the bearing-blocks, a yielding contact device supported by the frame and forming one terminal of an electric circuit, a contact-finger fixed on the journal of the detector-roll and forming the other terminal of the circuit and adapted, when the detector-roll is rotated, to engage the yielding contact device, and a coiled spring connected at one end

to the contact-finger and at its opposite end to the frame, substantially as specified.

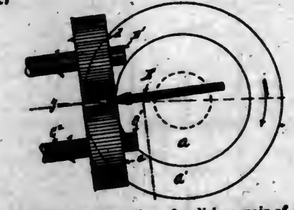
601,781. BATHING-SUIT. MARY M. SHEPARD, Darlington, S. C. Filed Jan. 11, 1897. Serial No. 618,822. (No model.)

Claim.—1. In a bathing-suit, the combination of stockings, pants having their leg portions of larger diameter than the stockings, and having their lower ends gathered and permanently secured to the upper ends of the said stockings so as to drape thereover and produce a baggy effect, and elastics secured at their lower ends to the upper portion of the stockings and at their upper ends to the lower portion of the pants a distance above the tops of the stockings and having the intermediate portion loose, whereby the stockings are supported without interfering with the baggy effect of the pants, substantially as set forth.

2. In a bathing-suit, the combination of a waist and a pair of pants formed together, the pants having the seat portion shirred, elastics applied to the shirred portions, and reinforcing tapes or straps joined at their lower ends to the upper portion of the elastics and connected at their upper ends with the waist, substantially as and for the purpose set forth.

3. In a bathing-suit, the combination of a waist and pants formed together, stockings attached to the pants, reinforcing-strips applied to the stockings, elastics joined to the upper ends of the reinforcing-strips and having connection at their lower ends with the knee portion of the stockings and at their upper ends with the pants, and reinforcing-strips joined at their lower ends to the upper ends of the said elastics and stitched to the waist and extending to the upper portion thereof, substantially as set forth.

4. A bathing-suit comprising a waist, pants, stockings and shoes permanently connected substantially as set forth, corsets having each half permanently secured between its ends to the waist upon opposite sides of a medial line, elastics shirred to the seat portion of the pants, reinforcing-strips applied to the lower portion of the stockings, elastics joined to the upper ends of the reinforcing-strips and having connection at their lower ends with the knee portion of the stockings and shirred thereto, and shirred at their upper ends with the lower portion of the pants, tapes secured to the upper portion of the waist and having their lower ends attached to the upper ends of the elastics applied to the pants and stockings, and other tapes secured to the upper back portion of the waist and having connection at their lower ends with the elastics secured to the seat, substantially as set forth.



601,782. PLANT-SUPPORT. WILLIAM H. SPIRE, Marthasville, Miss. Filed Dec. 22, 1897. Serial No. 663,088. (No model.)

Claim.—1. The herein-described tie, for connecting plants to supports, formed of a single piece of spring metal and comprising the plant-receiving loop having a convex inner side and also having the open mouth, and the outwardly-curved arms forming the terminals of the loop; said arms being adapted to embrace a support and terminating in barbs adapted to be embedded in the same, substantially as specified.

2. The herein-described tie, for connecting plants to supports, formed of a single strip of spring sheet metal and comprising the plant-receiving loop of concavo-convex form in cross-section having its convex side inward and also having an open mouth, and the outwardly-curved arms forming the terminals of the loop; said arms being adapted to embrace a support and terminating in barbs struck from one of their edges at intervals on their length, substantially as specified.

601,788. MECHANISM FOR PIERCING METAL INGOTS. JOHN C. BRUNSON, Erie, Pa. Filed Nov. 1, 1897. Serial No. 657,080. (No model.)

Claim.—1. The combination of a disk, a pair of rolls overlapping the face of said disk, and a mandrel in the axis of the passage between said disk and rolls, substantially as set forth.

2. The combination in an ingot or billet piercing machine, of a disk, a pair of rolls overlapping the edge of the face of said disk, and a piercing-mandrel located in the axis of the passage between said disk and rolls at or near its narrowest point, substantially as set forth.

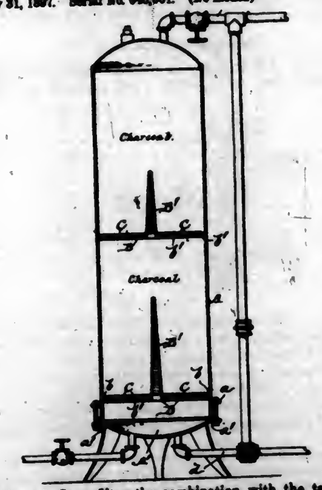
3. The combination in an ingot or billet piercing machine, of a disk having the periphery of its face beveled, a pair of rolls overlapping the beveled surface of said disk, and a piercing-mandrel located in the axis of the passage between said disk and rolls at or near the exit end of said passage, substantially as set forth.

4. The combination in an ingot or billet piercing machine, of a disk, a pair of conical rolls overlapping the edge of the face of said disk, and a piercing-mandrel located in the axis of the passage between said disk and rolls at or near its narrowest point, substantially as set forth.

5. The combination in an ingot or billet piercing machine, of a disk, having the periphery of its face beveled, a pair of conical rolls overlapping the beveled surface of said disk, and a piercing-mandrel located in the axis of the passage between said disk and rolls at or near the exit end of said passage, substantially as set forth.

601,784. MECHANISM FOR ROLLING OUT HOLLOW METAL INGOTS INTO TUBES. JOHN C. BRUNSON, Erie, Pa. Filed Nov. 1, 1897. Serial No. 657,081. (No model.)

Claim.—1. In a machine for reducing and drawing out hollow ingots or billets into tubes, a disk, a pair of rolls overlapping the edge of the face of said disk, and a mandrel in the axis of the passage between said disk and rolls, extending throughout said passage, substantially as set forth.



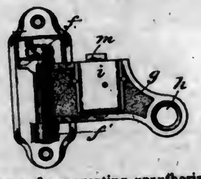
2. In a machine for reducing and drawing out hollow ingots or billets into tubes, a disk having the periphery of its face beveled, a pair of rolls overlapping the beveled surface of said disk, and a tapering mandrel inserted in the ingress end of the passage between said disk and rolls, and extending throughout said passage in the axis thereof, substantially as set forth.

3. In a machine for reducing and drawing out hollow ingots into tubes, a disk, a pair of conical rolls overlapping the edge of the face of said disk, and a mandrel located in the axis of the passage between

said disk and rolls, and extending throughout said passage, substantially as set forth.

4. In a machine for reducing and drawing out hollow ingots into tubes, a disk having the periphery of its face beveled, a pair of conical rolls overlapping the beveled surface of said disk, and a tapering mandrel inserted in the ingress end of and extending throughout the passage between said disk and rolls in the axis thereof, substantially as set forth.

601,785. **FILTER.** JOHN F. WIESBACK, Scranton, Pa. Filed July 31, 1897. Serial No. 646,661. (No model.)

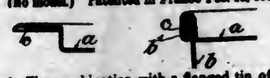


Claim.—1. In a filter the combination with the tank, of the "spider" or "grate" having the central perforated or foraminous cone and the coil of sheet metal arranged edgewise to, and upon, said "grate" or "spider," substantially as specified.

2. In a filter, the combination of a suitable tank or receptacle designed to contain charcoal or other suitable filtering agent, a spider or grate arranged in said tank, a coil of sheet metal arranged edgewise to and upon said spider, a valved service-pipe arranged outside of said tank and connecting therewith at or near its top, a valved feed-pipe connecting with said pipe at or near its bottom, and a valved waste-water pipe located near or at the bottom of the tank, substantially as described.

3. In a filter, the combination of a suitable tank designed to contain charcoal or other suitable filtering agent, a spider or grate arranged in said tank having a foraminous cone, a coil of metal ribbon arranged edgewise to and upon the spider, a valved feed-pipe connecting with the tank at or near its bottom, a valved service-pipe connected to said tank at or near its top, and a valved waste-water pipe connected tot he tank at or near its bottom, substantially as described.

601,786. **LOCK FOR TELEPHONES.** RALPH H. ALLEN, Fitchburg, Mass. Filed Sept. 3, 1897. Serial No. 650,428. (No model.)



Claim.—1. A means for preventing unauthorized use of a telephone, consisting of a base-plate and bracket, adapted to be secured in proximity to the call means of the instrument, and a swinging arm supported by the base-plate or bracket and adapted to engage the call means and to be locked in engaged position and to be unlocked with a key.

2. A means for preventing unauthorized use of a telephone, consisting of a base-plate and bracket, adapted to be secured in proximity to the crank-arm of the call-box, a stationary arm forming a part of the said base-plate and bracket, a swinging arm pivotally supported by the said base plate and bracket and adapted to engage the said crank-arm and to be locked to the stationary arm when so engaged, and to be unlocked by a key and disengaged from said crank-arm.

3. As a new article of manufacture, a base-plate bracket provided with the recessed arm *k*, the swinging locking-arm *g* provided on its end with means to engage the crank-arm of the call or bell box of a telephone, and a lock carried by the swinging arm, adapted to be operated by a key, the bolt of which lock is adapted to engage the recess of the arm *k*.

601,787. **HERMETIC FASTENING FOR PRESERVE OR OTHER TINS.** ISIDORE BLOCH, Paris, France. Filed Aug. 14, 1897. Serial No. 648,198. (No model.) Patented in France Feb. 13, 1897, No. 264,942.

Claim.—1. The combination with a flanged tin, of a cover having a flange facing and adjoining the flange on the tin, one of said flanges being provided with a suitable fillet, the two flanges being deflected into positions parallel with and close to portions of the walls of the tin, substantially as set forth.

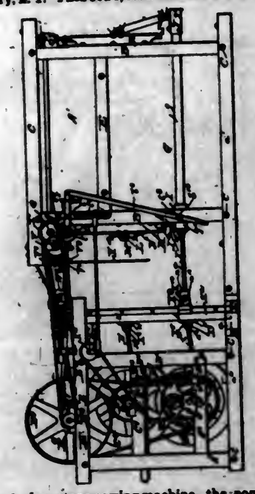
2. The combination with a flanged tin, of a cover having a flange facing the flange on the tin, one of said flanges being provided with a suitable fillet, the flange on one part overlapping and adjoining both sides of the flange on the other part, both flanges being deflected into positions parallel with and close to portions of the walls of the tin, substantially as set forth.

3. The combination with a flanged tin, of a cover having a flange facing and adjoining the flange on the tin, one of said flanges being provided with a suitable fillet, the two flanges deflected into positions close to outer surfaces of the walls of the tin, the cover being deflected inside of the tin, the portions so deflected being placed close to the interior surfaces of said tin, substantially as set forth.

4. The combination with a tin *b* having a flange *b'* turned downward, of a cover *a* having a flange provided with a fillet *c*, each flange being deflected downward and upward along flange *b'*, substantially as set forth.

601,788. **STRING INSTRUMENT.** THOMAS BERRY, Geneva, Ohio. Filed June 26, 1897. Serial No. 642,360. (No model.)

Claim.—1. In a musical string instrument, the combination with a metallic straining-frame, said straining-frame being provided with fulcrumed levers, one arm of said levers engaging and operating a straining-bar to which the strings are attached and another arm engaging a screw whereby the said levers are operated, substantially in the manner and for the purpose set forth.



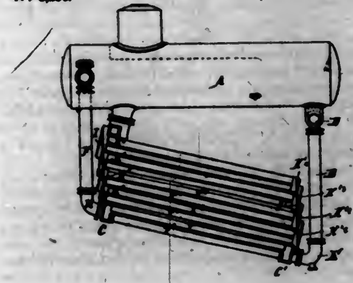
2. The combination with a straining-frame, of levers mounted in said straining-frame and fulcrumed thereto, said levers being operated by adjusting-screws and operating in turn to control the tension of the string by means of a straining-bar to which the strings are attached, substantially as and for the purpose shown and described.

3. The combination with a straining-frame and a series of adjusting-screws connected therewith and operating therein substantially as indicated, of a series of three-armed levers, one of the arms of said levers operating as a fulcrum-point, and engaging in the straining-frame another arm actuated by the adjusting-screws aforesaid, and the third arm operating the straining-bar and through it controlling the tension of the string, substantially as and for the purpose shown and described.

4. The combination in a musical string instrument, of a straining-frame from whence the tension of the string is controlled, said frame being secured to the wooden frame or back of the instrument at the end of the wooden frame, and a bridge in close proximity to the straining-bars, said bridge resting directly either upon the sounding-board or upon the wooden frame of the instrument, substantially as and for the purpose shown and described.

5. The combination with the string-frame of a piano of a metallic straining-frame, provided with suitable straining devices controlling the tension of the strings, said straining-frame being provided with a flange A^6 for securing it to the string-frame, and bridge C located in close proximity to the straining-frame, substantially as and for the purpose shown and described.

601,789. **STONE-SAWING MACHINE.** HARRY H. CUMMINGS, Dobbs Ferry, N. Y. Filed Oct. 9, 1896. Serial No. 608,267. (No model.)



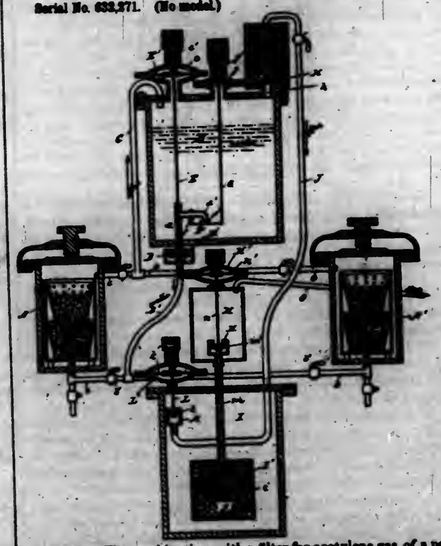
Claim.—1. In a stone-sawing machine, the combination, with a frame, one end of which is provided with longitudinal beams, of short shafts, one above the other, a pulley upon each of the upper shafts, and two driving-pulleys upon the lower one, a belt from the lower pulleys to each of the upper pulleys, a frame upon said beams provided with a toothed rack, a pulley in one end of the rack adapted to engage with the belt from the lower to the upper pulley, a rod, one end of which is provided with a gear-wheel in engagement with the rack, a hand-wheel upon the rod, a sash suspended in the frame, and means for connecting said sash with the two lower shafts, substantially as set forth.

2. In a stone-sawing machine, the combination, with a frame, of a sash suspended at one end of the frame and operating mechanism at the other end, a reciprocating frame intermediate the sash and the operating mechanism, a clamp within the frame, a rod for connecting the clamp with the sash therewith, a vertical screw-threaded shaft through the clamp, a longitudinal shaft journaled in the main frame above the reciprocating frame, and mechanism connected with the upper end of the screw-threaded shaft and longitudinally movably connected with the longitudinal shaft, substantially as set forth.

3. In a stone-sawing machine, the combination, with a frame, provided with posts, of hangers upon the posts, a sash suspended from the hangers, a reciprocating frame at one end of the sash and provided with a clamp, means for moving the reciprocating frame, a vertical screw-threaded shaft through each of the hangers and the clamp, a train of gearing connected with the screw-threaded shafts, and means for operating the gearing continuously or intermittingly, substantially as set forth.

601,790. **WATER-TUBE STEAM-GENERATOR.** LOUIS DE MASTRE, Willebroek, Belgium. Filed Mar. 31, 1897. Serial No. 630,173. (No model.) Patented in Belgium Dec. 28, 1896, No. 125,270; in France Feb. 13, 1897, No. 264,045; in Italy Feb. 14, 1897, No. 56/310; in England Feb. 26, 1897, No. 5,216; in Germany Mar. 2, 1897, No. 96,833; in Spain Mar. 6, 1897, No. 20,901, and in Austria Mar. 8, 1897, No. 47/3,233.

Claim.—1. A water-tube steam-generator consisting of one or two rows of inclined water-tubes placed immediately over the fire, joined at their ends into transverse collectors communicating at each end direct with an upper steam receiver and collector the front one at or about water-level, and the rear one at the base thereof, an upper group of inclined water-tubes interposed between said lower group and the steam-receiver consisting of separate elements each comprising two superposed water-tubes joined at their ends into vertically-arranged short sectional junction-boxes each connected to the one above and below it by open water-tube couplers, the upper front boxes all communicating with a transverse collector connected to the base of the steam-collector and the lowest rear boxes communicating by open water-tube couplers with the rear side of the rear transverse collector of the lower tube group, substantially as described for the purposes specified.

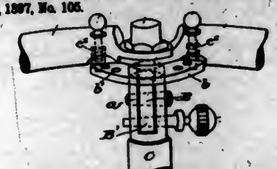


2. In a water-tube steam-generator the combination with the upper steam-receiver A of the lower tube group T, collectors O O' and independent pipe connections thereto, the upper tube group T^5 with sectional tube-end junction-boxes $K'K^2$, K^2, K^3, K^4, K^5, K^6, K^7, K^8 formed and arranged in sinuous lines, the front upper transverse collector L' being connected to the base of the steam-receiver A and the rear water connection to collector O' substantially as described.

3. In a water-tube steam-generator the combination with the upper steam-receiver A of the lower tube group T, collectors O O' and independent pipe connections thereto, the upper tube group T^5 with sectional tube-end junction-boxes K', K^2, K^3, K^4, K^5, K^6, K^7, K^8, K^9 in vertical lines with the front transverse collector L' connected to the base of the receiver A and rear water connection to collector O' substantially as described.

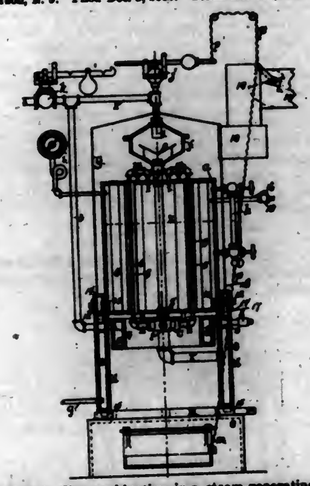
4. In a water-tube steam-generator the combination with the steam-receiver A, lower tube group T independently connected thereto, of the upper group of tubes T^5 comprising a superposed series of tubulous elements each element made up of two inclined superposed water-tubes fixed at their ends into sectional junction-boxes each box having three openings in its inner face, two for the tubes, and the third for a coupler joining it to the next lower similar box, three openings in front, one for the upper coupler, and two for access-holes and covers, said boxes being arranged in step-like form at each end and resting on each other substantially as described.

5. In a water-tube steam-generator the combination with the steam-receiver A, of the lower group of pipes T having an independent connection with the receiver at each end, the upper group of pipes parallel and coextensive with said lower group, an independent connection from the front of said upper group to the receiver, and a connection between the rear ends of the upper and lower group, substantially as described.



601,791. **APPARATUS FOR GENERATING ACETYLENE GAS.** JOHN FLOOD and JOSEPH KIPLING, Quebec, Canada. Filed Apr. 15, 1897. Serial No. 633,271. (No model.)

Claim.—The combination, with a filter for acetylene gas, of a perforated vessel I inside the ves-



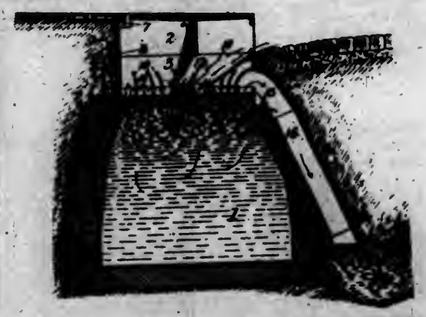
sel F', absorbent cotton in the vessel *i*, charcoal between the vessels F and *i*, a gas-pipe leading out of the vessel *i*, a gas-pipe J leading into the filter, and an automatic valve connected to the said filter and regulating the admission of gas through the pipe J, substantially as set forth.

601,792. HANDLE-BAR FOR CYCLES. DOUGLAS GARDNER and EDWARD R. HARTLEY, Birmingham, England. Filed Mar. 11, 1897. Serial No. 626,902. (No model.) Patented in England June 26, 1896, No. 14,123; in Germany Dec. 28, 1896, No. 93,244; in Belgium Feb. 20, 1897, No. 126,474; in France Feb. 22, 1897, No. 264,303; in Italy Feb. 28, 1897, XXXII, 43,984; in Spain Feb. 26, 1897, No. 20,458, and in India Mar. 16, 1897, No. 105.

Claim.—In combination, the steering-pillar having a forked upper end, a segmental plate pivoted in said fork and perforated to receive a pin, the said segment carrying a horizontal circular plate with a pivot-stud centrally thereof and of the fork and segment, and the handles both pivoted on said stud and having a pin passing through the handles into perforations in the plate, substantially as described.

601,793. STEAM-GENERATING APPARATUS. HENRY HERRIG, Paterson, N. J. Filed Dec. 3, 1897. Serial No. 660,686. (No model.)

Claim.—1. The combination, in a steam-generating device of a water-holding case *c*, pipes *u*, connected to pipes *o*, running through boiler-tubes 6, the pipe *w*, the pipes *r* and *s* for supplying case *c* from water-back and boiler; and the water-back *d*, the boiler *a* and their connections together substantially as described.



2. The combination in a steam heating device of an annular superheating-chamber, and its connection with a separator *f*, and the water-back *d*, the boiler *a*, and their connection with each other; substantially as described.

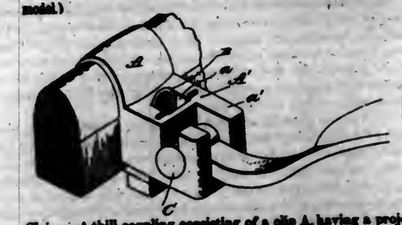
3. In a steam heating apparatus the annular superheating-chamber, in combination with the case *c*, and pipes *u*, *o*, and *w*, for the purpose of making steam quickly and superheating steam, all substantially as set forth.

4. In a closed-circulation and steam heating device the superheating device placed inside of the fire-box; consisting of an annular chamber in connection with a separator *f*, in combination with the water-back *d*, boiler *a*, water-heating case *c*, the water-tube connection *r*, pipes *u* and *o*, substantially for the purpose set forth.

5. In a steam-heating and closed circulating device a water-back *d*, and boiler connected; heating-case *c*, water-tube *r*, small pipes *u*, *o*, and *w*, in combination with steam-separating case *f*; jacket *g*, an annular superheating-chamber *b*, and pipes adapted for radiator connections, completing a closed circulation, substantially as described.

601,794. CATCH-BASIN FOR SEWERS. JOSEPH W. HENNINGER, Plymouth, Pa. Filed Feb. 17, 1897. Serial No. 623,774. (No model.)

Claim.—In a catch-basin for sewers of the character described, the combination with the two-part or sectional casting formed with apertured lugs, 8, the upper section having an inlet-opening and rectangular top, and the lower section having an outlet-opening, of the adjusting-bolts, 9, the inlet-tube 12 having oppositely-flaring sections, the inclined gutter 14 extending partly around the lower casting, the grating 18 along the outer edge of the gutter, and the outlet-pipe 16, substantially as described.



601,795. DRAFT-EQUALIZER. GEORGE F. HILLEGAS, Lane County, Oreg. Filed Aug. 9, 1897. Serial No. 647,893. (No model.)

Claim.—1. A draft-equalizer comprising a pair of flat bars A A, equalizer-bars pivoted between the ends of the same so as to engage therewith and provided at their ends with draft-hooks, means for connecting and centrally spreading the bars A A consisting of a tubular section, a bolt passing therethrough and a clevis the ends of which lie over the bars so as to be engaged by the head of the bolt and its nut, substantially as shown and for the purpose set forth.

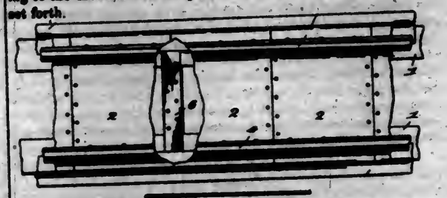
2. In a draft-equalizer the combination with the metallic bars A, A, a tubular section for holding said bars separated at the center, a bolt which passes through the tubular section the bars *a a* and the eyes of the clevis, a clevis the ends portions of which lie over the bars A, A, bars or doubletrees B, B, pivotally attached to the outer ends of the bars A A by bolts, substantially as shown and for the purpose set forth.

601,796. THILL-COUPLING. FRANK A. KEEN and PHILIP H. KEEN, Mason City, Iowa. Filed Aug. 26, 1897. Serial No. 649,467. (No model.)

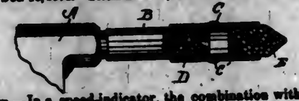
Claim.—A thill-coupling consisting of a clip A, having a projecting block A', with an aperture *a* therethrough, the rear wall of the aperture being inclined to provide an opening which is wider at the base than at the top, a transverse socket in advance of the aperture *a* and connected by an opening therewith, a thill-iron having a circular cross bar and a shank which projects therefrom and a metallic antirattling-spring B made of a single piece of wire to present coils, the upper end members farthest from the coil being bent outwardly so as to lie over the top wall of the block, an intermediate portion bearing upon the cross-bar C of the thill-iron, the parts being combined and organized substantially as shown and for the purpose set forth.

601,797. OIL-CAN. LEWIS MARSH, New York, N. Y. Filed Feb. 19, 1897. Serial No. 624,068. (No model.)

Claim.—An oil-can, in which are comprised a body or oil-holder; a vertical ring upon the body at the base of the spout, containing absorbent material; and a removable cloak arranged to pass over the absorbent material holder, clearing the same, but snugly embracing the body of the oil-holder, and extending to the bottom thereof, substantially as shown and described.



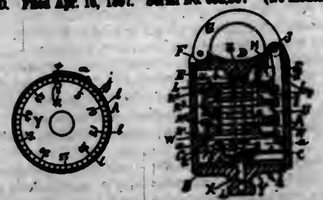
601,798. REFRIGERATOR LUNCH-BOX. ADOLF SOBEKA, New York, N. Y. Filed May 4, 1897. Serial No. 635,522. (No model.)



Claim.—As an improved article of manufacture, a refrigerator lunch-box comprising an outer shell 1, of waterproof paper-board, a box 1×, of sheet metal, inclosed within said paper shell and having an apertured partition 8, which divides it into two compartments, an ice-chamber at the bottom of one of said compartments, and an outlet for the water from the ice, a sheet-metal cover for said box, said cover being also covered with waterproof paper-board, a hinging-strap 3, which hinges the cover to the box, a securing strap and buckle for said cover, and an apertured tray 11, suspended in the box over the ice-chamber, said tray having hooks 11×, which take, one over the partition in the box and the other over one end of the latter, substantially as set forth.

601,799. RAILWAY BED AND TIE. BEN SMITH, Denver, Ill. Filed Sept. 20, 1897. Serial No. 652,573. (No model.)

Claim.—A road-bed and ties comprising a series of stringers arranged end to end and parallel with each other; metallic plates connecting the said stringers and extending entirely across the upper faces thereof, said plates being formed with perforations for the passage of spikes or bolts, whereby the plates and the track-rails are secured to the stringers, metallic plates secured to the upper outer edges of the stringers for the purpose set forth, and metallic strips secured to the faces of the braces between the stringers and extending to the metallic side strips, substantially as and for the purpose set forth.



601,800. SPEED-INDICATOR. LABOT S. STARRETT, Athol, Mass. Filed Dec. 16, 1896. Serial No. 573,864. (No model.)

Claim.—In a speed-indicator, the combination with the chambered spindle B and its conically-recessed yielding plug D, of the auxiliary sleeve C fitting frictionally over and around the chambered end of the spindle, and having the yielding conical tip E, substantially as and for the purpose set forth.

601,801. PERMUTATION-PADLOCK. ASHER B. STORY, Buxton, N. D. Filed Apr. 16, 1897. Serial No. 632,207. (No model.)

Claim.—1. In a combination or permutation lock, the combination with an operating-dial having the touching-pin *k*, the deep and numbered graduations *j*, upon its side and the deep graduations *l*, farther apart upon its outer edge or circumference, of a spring-arm having two edges adapted to be pressed one against the graduations *j*, and the other against the graduations *l*, substantially as and for the purpose set forth.

2. In a permutation-padlock, the combination with the casing A, having the screw-top D, adapted to be screwed upon the casing and having the hole H, the curved shackle G, pivoted to one edge of the cover and having the notched locking-bar I, pivoted to its swinging end and adapted to be inserted through the hole H, in the opposite edge of the cover and means for guiding it inside the casing, so as to prevent unscrewing of the cap, when the locking-bar is inserted, and notched locking-disks for locking the bar I, inside the lock, the said notches for the locking-bar being deeper as they approach the cover or top of the lock, substantially as and for the purpose set forth.

601,802. WHEEL. CHARLES D. STEVENS, New York, N. Y. Filed Feb. 27, 1897. Serial No. 625,236. (No model.)

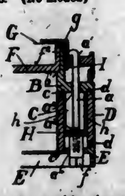
Claim.—1. The combination in a wheel, of a rim comprising a spring split circular tube A A', the portion A being independent and of a differing material from the part A', and constituting the tread proper, substantially as described.

2. The combination in a wheel, of a rim comprising a spring split circular tube A A', the portion A being independent and of spring metal and united at one side only to the portion A', substantially as herein specified.

3. The combination in a wheel, of a rim comprising a spring split circular tube A A', the free lapping portion of which is shouldered for the reception of the other edge portion, substantially as specified.

601,803. BARREL-LINING. JOHN V. BUSH, Chicago, Ill., assignor, by direct and mesne assignments, to Taylor B. Brown, same place. Filed June 12, 1897. Serial No. 640,488. (No model.)

Claim.—1. A removable lining for barrels made of three separate pieces of thin, flexible material comprising a tubular body portion consisting of a continuous strip which extends from the top to the bottom of said barrel and overlaps at its meeting edges, a lower end wall provided with an upturned marginal flange which extends outside of and embraces the lower end of the body portion, a sheet or disk engaging the upper end of the body portion to form the top wall of the lining; said tubular body portion being slitted at its upper margin to form a plurality of flaps which are bent inwardly to overlie said top wall and which, when they are so bent inwardly, overlap each other at their side margins to form in effect a continuous inwardly extending flange above said wall.



2. A removable lining for barrels or the like made of three separate pieces of thin flexible material comprising a tubular body portion which consists of a continuous strip extending from the top to the bottom of the barrel and overlapping at its meeting edges, a lower end wall comprising a circular sheet or disk of flexible material slitted in its margin and turned upwardly to form a plurality of marginal flaps which meet each other and overlap to constitute a continuous flange which extends outside of and embraces the tubular end of the body portion and a circular sheet or disk engaging the upper end of said tubular body portion to form the top wall thereof said tubular body portion being provided with a plurality of integral flaps upon its upper edge which are turned inwardly to overlie said top wall.

3. A removable lining for bulged barrels made of three separate pieces of thin, flexible material comprising a tubular body portion made from a continuous strip equal in length to the greatest interior circumference of the barrel, said body portion being crimped or folded at its opposite ends to fit within the end portions of the barrel, a lower end wall provided with an upturned, marginal flange which latter is adapted to extend outside of and embrace the lower end of said body portion and a sheet or disk adapted to engage the upper end of said body portion to form the top wall of the lining.

4. A removable lining for bulged barrels made of three separate pieces of thin flexible material comprising a tubular body portion made from a continuous sheet which is equal in length to the greatest interior circumference of the barrel and which is crimped or otherwise shaped at its opposite ends to fit within the end portions of the barrel, a lower end wall provided with a slitted upturned marginal flange adapted to extend outside of and embrace the lower end of said body portion, a circular sheet or disk adapted to engage the upper end of said body portion to form the top wall of the lining and a plurality of integral flaps on the upper end of the said body portion which are turned inwardly to overlap said top wall and being arranged to overlie each other at their side edges.

601,804. BANJO. JOHN BRANDT, Chicago, Ill. Filed Mar. 29, 1897. Serial No. 629,742. (No model.)

Claim.—1. In a banjo, the combination of a drum, of a ring having a flange at a suitable angle to the body of said ring, said flange having an offset part or shoulder on the inner side thereof: and a sounding-board placed beneath said drum, and occupying the entire area of said flanged ring, said sounding-board having a flange adapted to fit closely against the inner offset portion of the flange on said ring, in such manner that said sounding-board may be held in position by the friction of said adjacent parts alone; said sounding-board having a sound-hole therein: substantially as described.

2. A banjo, the body whereof is formed of a hollow frame composed of parallel rings, and rings, the bodies whereof are placed substantially perpendicular thereto; the several portions of said frame being detachably united by suitable means, substantially as described.

3. A banjo, the body whereof is composed of a hollow frame, composed of separable portions detachably united by hook-bolts or clamps, substantially as described.

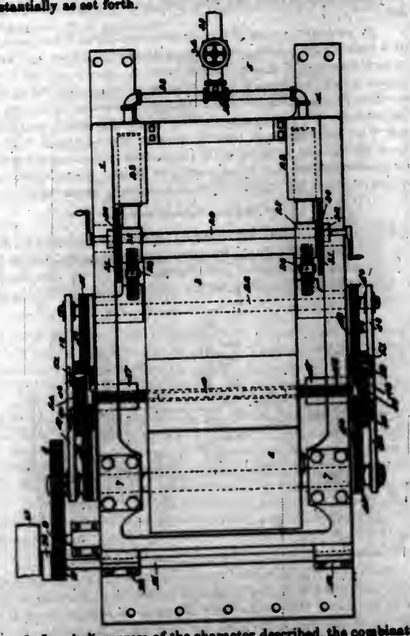
4. A banjo, the body whereof is formed of a hollow frame, composed of parallel rings and rings placed perpendicular thereto; said parallel rings having suitable apertures therein to receive hook-bolts, or other suitable form of clamp; in combination with an adjustable ring for regulating the tension of the drum of said banjo, and hook-bolts, or other form of adjustable clamps, passing through said apertures and engaging with the adjustable tension-regulating ring, substantially as described

5. A banjo, the frame whereof is composed of a flat ring having a flange placed perpendicular thereto, said flange sustaining the drum of the banjo and an outside flange or guide having a sliding engagement with the flange of an adjustable ring for regulating the tension of the drum of said banjo; two rings placed perpendicularly to said flat ring on the side thereof, opposite said perpendicular flange, and a ring at the opposite ends of said perpendicular rings, forming a bearing for hook-bolts or clamps, connecting said several portions of said frame, substantially as described.

6. In a banjo, the body whereof is composed of a hollow frame composed of rings and flanges, as described, a supplementary ring placed between the upper and lower rings of said frame, and held rigidly in position as a bearing for the nuts on the hook-bolts for regulating the tension of the drum, substantially as described.

7. In a banjo, substantially as described, a ring B, having an upright flange, B', for sustaining the drum of said banjo, and an outer flange, B^2, having sliding engagement with a downward flange, A^2, of the ring A; said ring A, having an inside flange, A', for holding the drum of said banjo in position, and regulating the tension thereof; in combination with an inner ring, C, and an outer ring, D, placed perpendicular to the central portion, b', of the ring, B'; said rings, C and D, engaging at their opposite ends with the ring E; said ring E having an outer downward flange, e'; said rings B, C, D and E being held together by the hook-bolts, b, and the nuts, b^2, bearing on the outer portion of the ring E; and hook-bolts or clamps, a, bearing upon the upper outside surface of the ring, A, at one extremity thereof, and having nuts, f, at their other extremity; said hook-bolts passing through suitable apertures in said several rings, and said nuts, f, having a suitable bearing within said hollow frame for adjusting the ring A, substantially as described.

601,805. TENT-FASTENING. ROBERT C. COOK, Oak Park, Ill. Filed Mar. 13, 1897. Serial No. 627,246. (No model.)



Claim.—1. The combination, with a tent-section having a corded edge, of a fastening for said section, said fastening having a metal body provided at one end with curved jaws forming an enlarged and unobstructed opening which receives and is adjustable along the corded edge of the tent-section, said jaws having between their extremities an opening of less width than the corded edge, extending in the line of strain and adapted to admit the body of the tent-section, and the body of said fastening being perforated for the attachment thereto of a rope, substantially as and for the purpose described.

2. A combined tent-clip and guy-rope fastening consisting of a metal body having open jaws at one of its ends curved to embrace the margin of the tent and adjustable therealong, intermediate separated perforations through which an end of the guy-rope may be run, and having its other end adapted for connection with another strand or end of the guy-rope, substantially as described.

601,806. PRESS FOR BALING COTTON. FRANK I. DYER, Washington, D. C., assignor to the American Cotton Company, New York, N. Y. Filed Nov. 23, 1894. Serial No. 529,251. (No model.)

Claim.—1. In a cotton-press of the character described, the

combination of two baling-rolls, and a core mounted between said baling-rolls in the same horizontal plane therewith, the baling-rolls being movable toward and away from each other, whereby the completed bale may be dropped by gravity from between the baling-rolls, substantially as set forth.

2. In a baling-press of the character described, the combination of two baling-rolls, a core mounted between said baling-rolls and in the same horizontal plane therewith, and means for effecting pressure on the baling-rolls, said baling-rolls being movable away from and toward each other, whereby the completed bale may be dropped by gravity from between the same, substantially as set forth.

3. In a baling-press of the character described, the combination of two baling-rolls, a core mounted between said baling-rolls and in the same horizontal plane therewith, a hydraulic cylinder having a piston connected with the journal-boxes of one of the baling-rolls, and means for offering resistance to the movement of said piston in said cylinder, said baling-rolls being movable toward and away from each other, whereby the completed bale may be dropped by gravity from between the same, substantially as set forth.

4. In a baling-press of the character described, the combination of two baling-rolls, a core mounted between said baling-rolls and in the same horizontal plane therewith, a hydraulic cylinder having a piston connected with the journal-boxes of one of the baling-rolls, a second and smaller cylinder connected with said hydraulic cylinder behind the piston therein, and a piston in said second cylinder adapted to be elevated by the movement of the hydraulic piston to allow for the gradual escape of water from the hydraulic cylinder, said baling-rolls being movable toward and away from each other, substantially as set forth.

5. In a baling-press of the character described, the combination of two baling-rolls, a core mounted between said baling-rolls and in the same horizontal plane therewith, said baling-rolls being movable toward and away from each other, a hydraulic cylinder having a piston connected with the journal-boxes of one of the baling-rolls, a second and smaller cylinder connected with said hydraulic cylinder behind the piston therein, a piston in said second cylinder adapted to be elevated by the movement of the hydraulic piston to allow for the gradual escape of water from the hydraulic cylinder, and means for effecting a graduated resistance to the elevation of the second piston, substantially as set forth.

6. In a baling-press of the character described, the combination of two baling-rolls, a core mounted between said baling-rolls and in the same horizontal plane therewith, said baling-rolls being movable toward and away from each other, a hydraulic cylinder having a piston connected with the journal-boxes of one of the baling-rolls, a second and smaller cylinder connected with said hydraulic cylinder behind the piston therein, a piston in said second cylinder adapted to be elevated by the movement of the hydraulic piston to allow for the gradual escape of water from the hydraulic cylinder, and an adjustable weight on the piston of the said second cylinder, substantially as set forth.

7. In a baling-press of the character described, the combination of a stationary baling-roll, a movable baling-roll, a core mounted between said baling-rolls in the same horizontal plane therewith, the baling-rolls being movable toward and away from each other, means for effecting pressure on the baling-rolls, a shaft carried by the movable baling-roll behind the same and having a gear-wheel keyed near each end thereof, and a rack on each side of the main frame of the machine with which said gear-wheel engages for the purpose mentioned, substantially as set forth.

8. In a cotton-press of the character described, the combination with two baling-rolls mounted in the same substantially horizontal plane, of a core mounted between said baling-rolls and on which the bale is formed, means for constantly rotating the bale, whereby a continuous sheet or bat of cotton may be wound convolutionally thereon, and an inclined apron or guideway for conveying said continuous sheet or bat to the revolving bale, substantially as set forth.

9. In a cotton-press of the character described, the combination of a stationary baling-roll, a movable baling-roll mounted in the same substantially horizontal plane therewith, means for rotating said rolls, means for effecting pressure on the movable baling-roll, and an apron or guideway permanently located above the stationary baling-roll for conveying a continuous sheet or bat of cotton between said rolls, whereby said sheet or bat will be wound convolutionally on the bale, substantially as set forth.

10. In a cotton-press of the character described, the combination of a stationary baling-roll, a movable baling-roll mounted in the same substantially horizontal plane therewith, a core mounted between said baling-rolls and on which a continuous sheet or bat of cotton is wound convolutionally while being subjected to pressure of said baling-rolls, means for rotating said baling-rolls, means for effecting pressure on the movable baling-roll, and an apron or guideway permanently located above the stationary baling-roll for conveying said continuous sheet or bat to the rotating bale, substantially as set forth.

11. In a cotton-press of the character described the combination of two baling-rolls mounted in the same substantially horizontal plane and between which the bale is formed, said rolls being movable gradually away from each other as the bale enlarges in size, means for resisting the tendency of said rolls to separate, means for constantly rotating the bale, whereby a continuous sheet or bat of cotton may be wound convolutionally thereon, an apron or guideway for conveying said continuous sheet or bat to the rotating bale, and a guide or table beneath said baling-rolls for receiving the finished bale, substantially as set forth.

12. In a cotton-press of the character described, the combination of two baling-rolls mounted in the same substantially horizontal plane, a core mounted between said baling-rolls and on which the bale is formed, means for effecting pressure on the bale during its formation, means for constantly rotating the bale, whereby a continuous sheet or bat of cotton may be wound convolutionally thereon, an apron or guideway for conveying said continuous sheet or bat to the rotating bale, and a guide or table beneath said baling-rolls for receiving the finished bale, substantially as set forth.

13. In a cotton-press of the character described, the combination of a stationary baling-roll, a movable baling-roll mounted in the same substantially horizontal plane therewith, means for rotating said rolls, means for effecting pressure on the movable baling-roll, an apron or guideway permanently located above the stationary baling-roll for conveying a continuous sheet or bat of cotton between said rolls, whereby said sheet or bat will be wound convolutionally on the bale, and a guide or table beneath said rolls for receiving the finished bale, substantially as set forth.

14. In a cotton-press of the character described, the combination of a stationary baling-roll, a movable baling-roll mounted in the same substantially horizontal plane therewith, a core mounted between said baling-rolls and on which a continuous sheet or bat of cotton may be wound convolutionally while being constantly subjected to the pressure of said baling-rolls, means for rotating said baling-rolls, means for effecting pressure on said movable baling-roll, an apron or guideway permanently located above the stationary baling-roll for conveying said continuous sheet or bat to the revolving bale, and a guide or table beneath said baling-rolls for receiving the finished bale, substantially as set forth.

15. In a cotton-press of the character described, the combination of two baling-rolls and a core mounted between said baling-rolls in the same horizontal plane therewith, means for feeding a continuous sheet or bat to said core, and means for automatically starting the commencement of the winding of said sheet or bat around said core, substantially as set forth.

16. In a cotton-press of the character described, the combination

of two baling-rolls and a core mounted between said baling-rolls in the same horizontal plane therewith, means for feeding a continuous sheet or bat of cotton to said core, and a flexible guide-strip in engagement with said core for starting the commencement of the winding of said continuous sheet or bat thereon, substantially as set forth.

17. In a cotton-press of the character described, the combination of two baling-rolls between which the bale is formed, said baling-rolls being movable gradually away from each other as the bale enlarges in size, means for constantly rotating the bale, whereby a continuous sheet or bat of cotton may be wound convolutionally thereon, an operating-lever 15 actuating a clutch for arresting the rotation of the rolls, a cylinder containing a fluid, a piston mounted therein with which one of said rolls is connected, whereby the tendency of the rolls to separate is resisted, means for resisting the flow of liquid from said cylinder by the movement of the piston therein, and a valve adjacent to said operating-lever for allowing the return of the liquid into the cylinder for the formation of a new bale, substantially as set forth.

18. In a cotton-press of the character described, the combination of two baling-rolls mounted in the same substantially horizontal plane and between which the bale is formed, said baling-rolls gradually separating as the bale enlarges, a sprocket-wheel for driving each end of the shaft of each baling-roll, and connections between said sprocket-wheels for driving said baling-rolls, said connections allowing for the separation of said baling-rolls, substantially as set forth.

19. In a cotton-press of the character described, the combination of two baling-rolls mounted in the same substantially horizontal plane, said baling-rolls gradually separating as the bale enlarges, a core mounted between said baling-rolls and on which the bale is formed by convolutionally winding a continuous sheet or bat thereon, a sprocket-wheel for driving each end of the shaft of each baling-roll, and connections between said sprocket-wheels for driving said baling-rolls, said connections allowing for the separation of said baling-rolls, substantially as set forth.

20. In a cotton-press of the character described, the combination of two baling-rolls mounted in the same horizontal plane, means for resisting the tendency of said rolls to separate, and a core adapted upon the accumulation of the cotton to be supported slightly out of the plane of the baling-rolls, whereby the thrust of the bale will be received by the said baling-rolls instead of upon the bearings of said core, substantially as set forth.

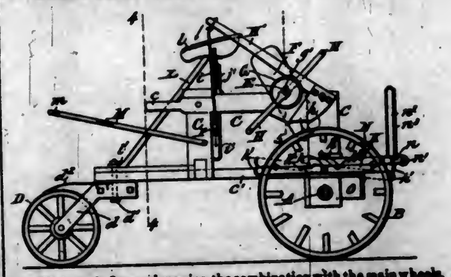
21. In a cotton-press of the character described, the combination of two baling-rolls mounted in the same horizontal plane, a core normally in the plane of the baling-rolls and between the same, and means for gradually elevating the core out of its normal plane during the formation of the bale for the purpose mentioned, substantially as set forth.

22. In a cotton press of the character described the combination of two baling-rolls, means for effecting pressure on the baling-rolls, a core mounted between said baling-rolls and normally in the same plane therewith, and means for gradually elevating the said core out of its normal plane during the formation of the bale, substantially as set forth.

23. In a cotton-press of the character described, the combination of two baling-rolls, means for effecting pressure on the baling-rolls, means for rotating said baling-rolls simultaneously, a core mounted between said baling-rolls and normally in the same plane therewith, and means for gradually elevating said core out of its normal plane during the formation of the bale, substantially as set forth.

24. In a cotton-press of the character described, the combination of the main frame, two baling rolls mounted therein in the same horizontal plane, an inclined guide in each side of said frame, a bearing-box working in each of said guides, and a core carried by said bearing-boxes normally in the plane of the baling-rolls and adapted to be gradually elevated out of its normal plane during the formation of the bale, substantially as set forth.

25. In a cotton-press of the character described, the combination of two baling-rolls mounted in the same horizontal plane, one of said rolls being stationary and the other movable, a core normally in the plane of the baling-rolls and between the same, means for gradually elevating the core out of its normal plane during the formation of the bale, a shaft 29 having gear-wheels 32 keyed to the ends thereof, racks 31 with which said gear-wheels engage, and adjustable connections between the movable baling-roll and said shaft for the purpose mentioned, substantially as set forth.



26. In a baling-press of the character described, the combination of two baling-rolls movable toward and away from each other, a core mounted between said baling-rolls and in the same plane therewith, sprocket-wheels 45, 46 carried by the shafts of said baling-rolls, swinging arms 47, 48 extending from said shafts and connected together at the lower ends, sprocket-wheels 50 and 51 at the lower ends of said swinging arms, connections between said sprocket-wheels 50 and 51, and sprocket-chains 55 and 56 connecting said sprocket-wheels 50, 51, and 45, 46, substantially as set forth.

27. In a baling-press of the character described, the combination of a stationary baling-roll, a movable baling-roll, a core mounted between said baling-rolls and movable toward and away from the stationary roll, and a shaft carrying a roll of canvas mounted above said core and traveling back and forth with the same, substantially as set forth.

28. In a cotton-press of the character described, the combination of a main frame, a baling-roll 2 mounted therein, slotted guides 20 in each side of said frame, bearing-boxes 21 carried in said slotted guides, a core 4 mounted in said frame between said baling-rolls, sprocket-wheels 45, 46 carried by the shafts of said baling-rolls, swinging arms 47, 48 extending down from said shafts and connected together at the lower ends thereof, sprocket-wheels 50 and 51 at the lower ends of said swinging arms, connections between said sprocket-wheels 50 and 51, and sprocket-chains 55 and 56 connecting said sprocket-wheels 50, 51, and 45, 46, substantially as set forth.

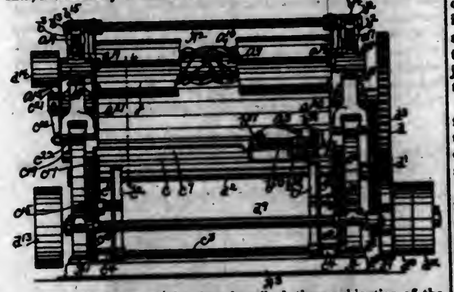
601,807. COMBINED REEL-CARRIER AND FEED-CART.

MARTIN HELGESON and OLAUS HELGESON, Linden, Minn., assignors of one-third to R. K. RASMUSSEN, Lake Crystal, Minn. Filed June 12, 1897. Serial No. 640,491. (No model.)

Claim.—1. In a reel-carrier, the combination with the main wheels, a reel-shaft, and a brake-roller secured thereto and adjustable in and out on the same, of a brake-lever, arranged to engage the brake-roller in one position of the same, and provided with a shoe arranged to engage one of the main wheels in the other position of the brake-roller, substantially as described.

2. In a reel-carrier, the combination with the main wheels, a reel-shaft having two pin-holes at its end, a brake-roller mounted on said end and having a pin-hole arranged to be brought into register with either pin-hole in the shaft, and a pin insertible in the registering pin-holes, of a brake-lever arranged to engage the brake-roller in one position of the latter, and provided with a shoe for engagement with one of the main wheels when the brake-roller is in its other position.

3. In a reel-carrier, the combination, with a main wheel of a scraper-bar pivoted eccentrically to the axis of the main wheel, a scraper at each end of the scraper-bar, each scraper being arranged to be brought into engagement with the wheel-rim when the scraper-bar is tipped in one direction on its pivot, and means for locking said scraper-bar in such tipped position.



4. In a reel-carrier, the combination with a main wheel of a scraper-bar pivoted eccentrically to the axis of the main wheel and provided with notches equidistant from the pivotal point and on each side of the same, a scraper at each end of the scraper-bar and arranged to respectively contact with the wheel-rim, when the scraper-bar is tipped, and a locking-pawl pivoted above the scraper-bar and arranged to be brought into engagement with either notch in the said bar, whereby the same is locked when tipped in either direction.

5. In a combined reel-carrier and feed-cart, the combination, with a framework arranged to receive both a reel and a cart-body interchangeable with the reel, and wheels on which said framework is mounted, of a removable brake mechanism arranged to brake the wheels and the reel, a cross-bar arranged to engage both the brake mechanism and the cart-body, and means for operating the cross-bar, whereby the said means serves either to apply the brake mechanism or to tilt the cart-body, substantially as described.

601,808. MACHINE FOR WORKING HIDES OR SKINS.

ALBERT F. JOHNS, Salem, Mass., assignor to the Vaughn Machine Company, Portland, Me. Filed June 4, 1897. Serial No. 639,267. (No model.)

Claim.—1. In a machine of the class described, the combination of the following instrumentalities, viz: a movable work-support upon which the hide or skin to be treated is placed, and an operating roll or cylinder supported by levers whose pivots are in a substantially vertical plane passing through the axis of the roll or cylinder and normally held substantially in the path of movement of the work-support, and means to automatically hold the said cylinder in its normal position and permit it to yield as the skin passes by it and yet automatically maintain the said cylinder in contact with the hide or skin under pressure irrespective of the thickness of the said hide or skin, substantially as described.

2. In a machine of the class described, the combination of the following instrumentalities, viz: a movable work-support, an operating cylinder or roll cooperating therewith, supports for said roll or cylinder movable in the arc of a circle and in which said roll is supported above the center of said circle, and means connected to said supports to normally place the said roll substantially in the path of movement of the work-support and adapted to permit the said roll to be moved by the work away from its normal position and to automatically maintain the said roll in contact with the work irrespective of the thickness of the same, substantially as described.

3. In a machine of the class described, the combination of the following instrumentalities, viz: a revolvable drum or work-support, means to secure the work thereon, a revolving cylinder or roll cooperating with the said drum, pivotal supports for said roll in which said roll is mounted in a substantially vertical line through the pivots for said supports, means to automatically move the said supports and the roll or cylinder toward said drum and maintain the said roll in engagement with the work on the revolving drum, substantially as described.

4. In a machine of the class described, the combination of the following instrumentalities, viz: a revolvable operating tool cooperating with said drum, substantially vertical pivotal supports for said tool movable toward and from the drum and in which the said tool is supported substantially in a vertical line through the pivots for said supports, means to automatically move said tool toward the said drum, and means to limit the movement of the tool toward said drum, substantially as described.

5. In a machine of the class described, the combination of the following instrumentalities, viz: a movable work support, a operating roll or cylinder cooperating therewith, pivoted levers supporting said roll, rods connected to said levers, springs to act on said rods and normally position the operating-roll substantially in the path of movement of the work-support, and means to limit the movement of the said operating-roll toward and from the work-support, the said springs automatically keeping the said operating-roll in engagement with the work while the latter is carried by its support past the said roll, substantially as described.

6. In a machine of the class described, the combination of the following instrumentalities, viz: a movable segmental drum, a clamping mechanism cooperating therewith, and an automatic feed mechanism cooperating with the segmental drum and clamping mechanism and actuated by said drum to feed the work onto the drum when the clamping mechanism is open, substantially as described.

7. In a machine of the class described, a segmental rotatable drum, an automatic work-feed mechanism consisting of a support for the work movable toward the drum, and a pusher movable with said support, and means to act on said pusher and push the work off from its support, substantially as described.

8. In a machine of the class described, the combination of the following instrumentalities, viz: a movable work-support, an operating roll or cylinder cooperating therewith, substantially vertical pivoted levers supporting said roll, rods connected to said levers, and springs to act on said rods and automatically keep said operating-roll in engagement with the work while the work is carried by its support past the said roll, substantially as described.

9. In a machine of the class described, the combination of the following instrumentalities, viz: a work-support comprising segments of a drum, clamping mechanisms cooperating with said segments and comprising stationary members or jaws, and movable jaws located within and movable toward the center of the drum to open the said jaws, actuating mechanisms for said movable jaws connected to said jaws to positively move the same, and a cam to operate said actuating mechanisms, substantially as described.

10. In a machine of the class described, the combination of the following instrumentalities, viz: a work-support comprising segments of a drum, an automatically-positioned operating roll or cylinder cooperating with said drum-segments, clamping mechanisms cooperating with said segments and comprising stationary members or jaws, and movable jaws located within and movable toward the center of the drum to open said jaws, actuating mechanisms for said movable jaws connected to said jaws to positively move the same, and a cam to operate said actuating mechanisms, substantially as described.

11. In a machine of the class described, the combination of the following instrumentalities, viz: a rotatable segmental drum, an automatic feed mechanism for the work cooperating with said segmental drum, and means movable with the drum to operate said feed mechanism, substantially as described.

12. In a machine of the class described, the combination of the following instrumentalities, viz: a movable work-support, an operating roll or cylinder, pivoted levers in which said roll is adjustably supported, spring-actuated rods connected to said levers to move the said roll toward the work-support, and adjustable means carried by the said levers to limit the movement of the said roll toward the work-support, and means to regulate the force of the said springs, substantially as described.

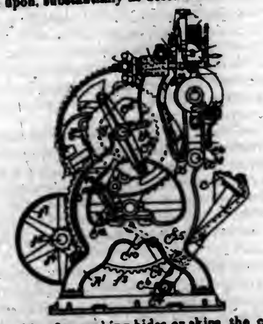
13. In a machine of the class described, the combination of the following instrumentalities, viz: a rotatable segmental drum provided with a clamping mechanism comprising a stationary jaw, and a movable jaw pivotally supported within the drum at one side of the center thereof and movable toward the center of the drum to open said jaw, substantially as and for the purpose specified.

14. In a machine of the class described, the combination of the following instrumentalities, viz: a rotatable segmental drum, a stationary clamping-jaw secured to the said drum, a movable clamping-jaw pivoted within the drum at one side thereof to cooperate with the inner face of the stationary jaw and movable toward the center of the drum to open said movable jaw, a cam, and mechanism connected to the free end of the pivoted jaw and operated by said cam, substantially as and for the purpose specified.

15. In a machine of the class described, the combination of the following instrumentalities, viz: a movable work-support upon which the hide or skin to be treated is placed, and an operating roll or cylinder movable in the arc of a circle having its center in a substantially vertical plane extended through said roll and normally held substantially in the path of movement of the work-support, and means to automatically hold the said cylinder in its normal position and permit it to yield as the skin passes by it and yet automatically maintain the said cylinder in contact with the hide or skin under a minimum pressure irrespective of the thickness of the said hide or skin, and means to adjust the pressure of the operating roll or cylinder upon the work, substantially as described.

16. In a machine of the class described, the combination of the following instrumentalities, viz: a movable work-support, an operating roll or cylinder cooperating therewith, substantially vertical levers pivoted at their lower ends and in which the said roll is pivoted to move in a substantially horizontal direction, and means to act on said levers and yieldingly maintain the said roll in operative engagement with the work on the said support, substantially as described.

17. In a machine of the class described, the combination of the following instrumentalities, viz: a movable work-support upon which the hide or skin to be treated is placed, and an operating roll or cylinder movable in the arc of a circle having its center in a substantially vertical plane extended through said roll and normally held substantially in the path of movement of the work-support, and means to automatically hold the said cylinder in its normal position and permit it to yield as the skin passes by it and yet automatically maintain the said cylinder in contact with the hide or skin under a minimum pressure irrespective of the thickness of the said hide or skin, substantially as described.



18. In a machine of the class described, the combination of the following instrumentalities, viz: a segmental drum, a clamping mechanism cooperating therewith and comprising a stationary jaw and a movable jaw pivoted within the drum off the center thereof and movable toward said center to open said jaw, an operating-roll, substantially vertical levers supporting said roll and pivoted in a substantially vertical plane tangential to said drum, means to move said roll toward said drum, and means to limit said movement of the roll, substantially as described.

601,809. MACHINE FOR WORKING HIDES OR SKINS.

ALBERT F. JOHNS, Salem, Mass., assignor to the Vaughn Machine Company, Portland, Me. Filed June 9, 1897. Serial No. 639,969. (No model.)

Claim.—1. In a machine for working hides and skins, the combina-

tion of the following instrumentalities, viz: a rotatable work-support, a clamping mechanism movable with said work-support and provided with a movable jaw pivoted within the said work-support off the center thereof and movable toward the center of said work-support in the act of opening, an actuating mechanism for said movable jaw, and a cam provided with a cam-groove which is engaged by said actuating mechanism and is constructed to open the jaw, to hold the same open to permit the hide to be placed in position, to gradually close said jaw on the hide, and to hold the jaw closed while the hide is being acted upon, substantially as described.

2. In a machine for working hides or skins, the combination of the following instrumentalities, viz: a rotatable work-support, a clamping mechanism coöperating therewith and provided with a movable jaw, a cam provided with a cam-groove, and an actuating mechanism for said movable jaw engaging said cam-groove and comprising two loosely-connected members having a yielding medium interposed between them, and means to limit the movement of said members by said yielding medium, substantially as described.

3. In a machine for working hides or skins, the combination of the following instrumentalities, viz: a rotatable work-support, a clamping mechanism coöperating therewith and provided with a movable jaw, a cam provided with a cam-groove, and an actuating mechanism for said movable jaw engaging said cam-groove and comprising two loosely-connected members, a spring interposed between said members, means to adjust the tension of said spring, and means to limit the movement of said members by said spring, substantially as described.

4. In a machine for working hides or skins, the combination of the following instrumentalities, viz: a rotatable segmental drum, a clamping mechanism coöperating therewith and provided with a movable jaw pivoted at one end within said drum and having its free end movable toward the center of the drum in the act of opening, an actuating mechanism positively connected to the free end of said jaw, and a cam having a cam-groove engaged by said actuating mechanism to positively move said jaw in opposite directions and thereby positively close and open said jaw, substantially as described.

5. In a machine for working hides or skins, the combination of the following instrumentalities, viz: a rotatable work-support, a clamping mechanism coöperating therewith and provided with a movable jaw, an actuating mechanism positively connected to said jaw and consisting of loosely-connected members having a yielding medium between them, means to limit the movement of said members by said yielding medium, and a cam positively engaged by said actuating mechanism to positively close and open the said movable jaw, substantially as described.

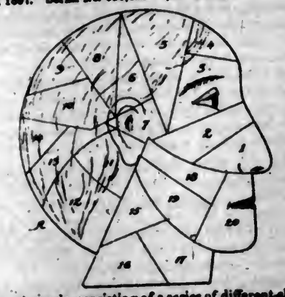
6. In a machine for working hides or skins, the combination of the following instrumentalities, viz: a segmental drum, a clamping mechanism coöperating therewith and comprising a stationary jaw, a movable jaw pivoted within said drum at one side of its center to move toward the center of the drum in the act of opening, a cam provided with a cam-groove, and an actuating mechanism for said movable jaw comprising two members loosely connected together and one of which is connected to the free end of the movable jaw, and a yielding medium between said members, substantially as described.

7. In a machine for working hides or skins, the combination of the following instrumentalities, viz: a movable work-support, an operating-roll coöperating therewith, supporting-levers for said roll, a hood or cover for said roll pivoted to said levers, and means to lock said cover in its operative position, substantially as described.

8. In a machine for working hides or skins, the combination of the following instrumentalities, viz: a rotatable work-support, a clamping mechanism coöperating therewith and provided with a movable jaw pivoted at one end within said work-support off the center thereof and having its free end movable toward the center of the work-support in the act of opening, a stationary cam provided with a cam-groove, and an actuating mechanism for said movable jaw positively connected to the free end of said jaw and engaging said cam to be actuated thereby to positively and pivotally open and close said movable jaw, substantially as described.

9. In a machine for working hides or skins, the combination of the following instrumentalities, viz: a rotatable work-support, a clamping mechanism coöperating therewith and provided with a movable jaw, an actuating mechanism connected to said jaw and comprising two members pivotally connected together and provided with arms a yielding medium interposed between said arms, means on said members to limit their movement by said yielding medium, and a cam positively engaged by said actuating mechanism to positively close and open said movable jaw, substantially as described.

601,810. RAILROAD-TIE. JOHN KLEIN, Nescopeck, Pa. Filed Sept. 30, 1897. Serial No. 653,622. (No model.)



Claim.—1. A metallic tie comprising a central section adapted to extend between and engage the inner faces of a pair of rails and provided with lateral extensions having openings, the end sections engaging the outer faces of the rails and provided with threaded pins extending through the openings of the lateral extensions, and nuts engaging the threaded pins and arranged at the inner edges of the lateral extensions, substantially as described.

2. A metallic cross-tie comprising a central section provided with lateral extensions having openings, the end sections provided with threaded pins extending through the openings of the lateral extensions, nuts engaging the threaded pins and arranged at the inner edges of the lateral extensions, and the vertical projections 3 mounted on the sections and engaging the inner and outer faces of the rails, each projection being provided with vertical faces and recessed at 7 and undercut at 4 to provide recesses to receive the bottom flanges of the rails, substantially as described.

3. A metallic tie formed of three sections, the middle sections being adapted to extend between and partly below the track-rails and having its ends widened laterally and provided with vertical projections to engage the web of the respective rails on their inner sides and having also a recess in each end from which openings extend out to opposite sides of the middle portion of the section, and the end sections being adapted to abut against the ends of the middle sections below the rails and having vertical projections to engage the web of the respective rails of their outer sides, each end section having a tongue on its inner end to fit in the recess in the ends of the middle section, threaded pins extending from the tongue through the said openings, and nuts on the threaded pins, substantially as described.

601,811. PUZZLE. JACOB H. LANDIS, Custer's Ford, Pa. Filed Nov. 19, 1897. Serial No. 659,121. (No model.)

Claim.—A puzzle, consisting of a series of different-shaped blocks adapted to be arranged and rearranged to form the outline of two or more figures, said blocks having various features printed on each side thereof, whereby in one arrangement one figure will be represented and by a reversal and a different arrangement another figure will be represented, said blocks being numbered so that by placing adjacent blocks so as to have consecutive numbers aid will be given in the formation of the figures, substantially as shown and described.

601,812. BEEF-ROASTER. PIERRE MICHEL, Philadelphia, Pa. Filed Nov. 20, 1897. Serial No. 659,561. (No model.)

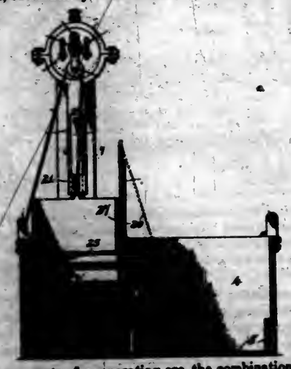
Claim.—In combination, a furnace, an open grate therefor, a flue leading therefrom, a casing inclosing the space in front of the grate, sliding doors arranged on curved ways, a series of spindles journaled vertically, a series of supporting-rods suspended from said spindles, a series of chains depending from the rods, a cross-shaft, gears carried thereby meshing with gears carried by the spindles, a set of beveled gears for revolving the cross-shaft, a worm-wheel secured upon the beveled gear-shaft, a worm meshing with said worm-wheel, and a motor-wheel carried upon the same shaft with the worm, all arranged substantially as and for the purpose set forth.

601,813. BICYCLE HANDLE-BAR. HOWARD W. MCGRADY, Oak Park, Ill. Filed May 10, 1897. Serial No. 635,661. (No model.)

Claim.—1. A tubular bicycle handle-bar in combination with a tubular handpiece detachably connected to the handle-bar, said handpiece being composed of a metal tube internally provided with a piston and air-conduits, whereby it is adapted to serve as a pump, said handpiece being externally provided with a suitable cushion forming a hand-grip, substantially as described.

2. A tubular bicycle handle-bar in combination with a pump-barrel, said parts being adapted for threaded connection with each other, the threads being located externally of the body of the pump and at a point between its ends, the discharge end of the pump being adapted to project into the hollow end of the handle-bar and the remainder of the body of the pump projecting beyond said bar and adapted to serve as a handpiece, substantially as described.

3. The combination, with a hollow handle-bar, of a hollow grip having an outer closed end and an open inner end, and detachably secured to the handle-bar, and a piston in the grip, and having its stem projecting into the handle-bar, substantially as described.



601,814. GARMENT-CLASP. WILLIAM G. MOORE, Wilmington, Del. Filed June 4, 1897. Serial No. 639,422. (No model.)

Claim.—In a garment-clasp, the combination of two oppositely-located semispherical casings and a rod having a flattened circular head thereon socketed within one of the said casings, the said rod having an oval head upon its free end which engages within the other casing, said casing having a key-shaped aperture leading therethrough, and means for fastening the said casings to the opposing flaps of the garment, substantially as shown and described.

601,815. ORE SEPARATOR. ANDREW W. PATTERSON, Aurora, Mo. Filed May 26, 1897. Serial No. 638,263. (No model.)

Claim.—1. In apparatus for separating ore, the combination of a tank, a jig-box, a shaft having an eccentric portion, connections between the jig-box and eccentric portion of the shaft and comprising parts slidably related and having a limited movement, and means independent of the suspending and jigging mechanism for raising and lowering the jig-box and moving the parts comprising the slidable connections, substantially as set forth.

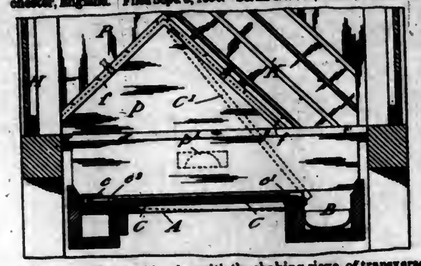
2. In apparatus for separating ore, the combination of a tank, a jig-box, a shaft having an eccentric portion, bars secured at their outer ends to the jig-box and eccentric portion of the shaft and having their inner ends slidably connected, and limited in their outward movement, a windlass, and a cord or flexible connection between the jig-box and windlass for raising and lowering the jig-box and moving the parts comprising the slidable connection, substantially as set forth.

3. In combination, a tank, a jig-box, a shaft, an eccentric adjustably connected with the shaft, bars slidably related and connecting the adjustable eccentric with the jig-box, and limited in their outward movement, and means independent of the jigging mechanism for raising and lowering the jig-box and moving the slidably-related bars relatively to each other, substantially in the manner set forth for the purpose described.

4. In apparatus for separating ore, a jig-box provided with an opening in its side, a pendent plate having loose connection at its upper end with the box at a point below the said opening, a gate normally closing the opening, and a connection between the pendent plate and gate for raising the lower end of the plate when elevating the gate, substantially as set forth for the purpose described.

5. An apparatus for separating ore comprising in its construction a tank subdivided by a vertical partition, forming a vat and sludge-box, the rear end of the vat and the partition being provided with sluice-gates, a jig-box operating in the vat and having a gate-controlled opening in its rear side, plates having loose connection with the sides of the jig-box, a shaft, eccentrics adjustably connected with the shaft, bars slidably connected and interposed between the jig-box and eccentrics, sheave-pulleys loosely mounted upon the said shaft, a windlass, and connections between the windlass and jig-box for raising and lowering the latter, substantially in the manner set forth for the purpose specified.

601,816. HOOK AND EYE. CHARLES F. ROSSIER, Aldrich, Ala. Filed Mar. 15, 1897. Serial No. 627,522. (No model.)

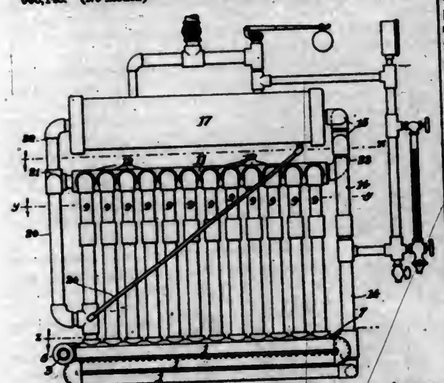


Claim.—1. A garment-fastener having a dished body-plate provided with prongs projecting on its concave side and extending approximately parallel with it, and lying chiefly within its concavity, said prongs extending parallel to and out of line with one another.

2. A garment-fastener having a dished body-plate provided with prongs 3, 3, projecting on its concave side, having abrupt bases 10, and extending approximately parallel with it, but turned downwardly at their points, formed with barbed heads, and lying chiefly within the concavity of the dished plate.

3. A garment-fastener having a dished body-plate provided with prongs projecting on its concave side and extending approximately parallel with it, and lying chiefly within its concavity, said prongs having barbed heads, the rear shoulders 9, 9 of which are beveled and rounded as shown to hold the prongs in the fabric while permitting intentional detachment therefrom.

601,817. PURIFIER FOR MIDDLINGS. HENRY SIMON, Manchester, England. Filed Sept. 3, 1896. Serial No. 604,666. (No model.)

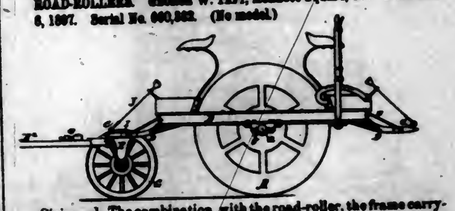


Claim.—1. The combination with the shaking-sieve, of transverse dust-collecting channels arranged above the same and hinged to one of the longitudinal sides of the sieve-frame, whereby the channels can be swung up when access is required to the sieve, substantially as set forth.

2. The combination with the shaking-sieve having a longitudinal dust-channel along one of its sides, of a grid of transverse dust-collecting channels arranged above the sieve with their lower sides in proximity to the sieve and their upper sides sloping toward said longitudinal dust-channel, said grid of channels being composed of sections which are arranged side by side from the head to the tail of the sieve and hinged to the sieve-frame on the side on which said longitudinal channel is arranged, substantially as set forth.

3. The combination with the inclosing casing and the shaking-sieve having a longitudinal dust-channel along one of its sides, of a grid of transverse dust-collecting channels attached to the sieve and arranged in proximity to the upper side of the sifting-surface, with their upper sides sloping toward said longitudinal channel, and stationary steeply-inclined dust-collecting channels extending across the interior of said casing and arranged with their lower ends over said longitudinal channel and with their higher ends over the opposite side of the sieve, substantially as set forth.

601,818. BOILER FOR STEAM HEATING APPARATUS. HADLEY J. STRICKER, Port Chester, N. Y. Filed Nov. 29, 1897. Serial No. 660,145. (No model.)



Claim.—1. In a boiler for a steam heating apparatus, the combination of the horizontal pipes disposed in communicating lengths one above the other at the sides of the fire-box, the horizontal pipes at the front and rear of said box and with which the first-mentioned pipes communicate, the horizontal pipes 7, 8, in communication with the before-mentioned pipes, the vertical pipes leading from the pipes 7, 8, the horizontal pipe 11 near the top of the boiler with which said vertical pipes communicate, the steam-dome at the top of the boiler, and connections between the ends of said dome and the ends of said pipe 11, substantially as set forth.

2. In a boiler for a steam heating apparatus, the combination of a system of communicating pipes horizontally disposed around the sides of the fire-box of a furnace, vertical pipes communicating with each other and extending upward at opposite sides of the boiler, a horizontally-disposed pipe near the top of the boiler into which these vertical pipes lead, a steam-dome on top of the boiler, and connections between the ends of said horizontal pipe and the ends of said dome and additional connections between the aforesaid connections and the horizontally-arranged series of pipes independent of the said vertical pipes, substantially as set forth.

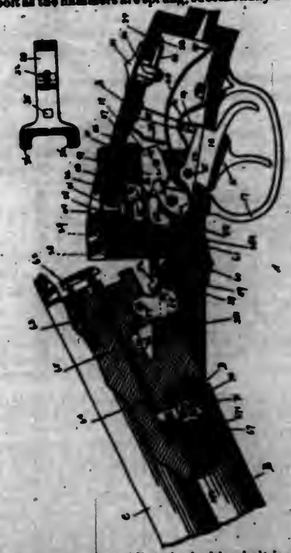
3. In a boiler for a steam heating apparatus, the combination of a system of communicating pipes horizontally disposed around the sides of the fire-box of a furnace, the series of vertical pipes communicating with each other and leading upward from said system at opposite sides of the boiler, the steam-dome at the top of the boiler, the horizontally-disposed pipe 11 near the top of the boiler and into which the vertical pipes lead, the pipes 14, 18, 20, leading from said horizontal system upwardly and connected with the sides of said dome, and connections between the ends of the pipe 11 and the pipes 14, 20, substantially as set forth.

601,819. TONGUE-TRUCK CONNECTION FOR REVERSIBLE ROAD-ROLLERS. GEORGE W. TAFT, Kennett Square, Pa. Filed Dec. 6, 1897. Serial No. 660,862. (No model.)

Claim.—1. The combination, with the road-roller, the frame carrying the bearings for the roller axle or journals, and the detachable tongue-truck; of a connection-plate fixed to said frame, and having the forwardly tapered horse V-shaped mouth, and seat for receiving the pintle-stud, and the locking yoke or loop hinged upon said connection-plate and adapted to fall in front of the pintle-stud for confining the same in said seat; said yoke provided with the forward projection having the upwardly-inclined under surface, substantially as set forth.

2. In combination, substantially as described, with a road-roller, its draft-frame, and the detachable tongue-truck having means for harnessing the team thereto, and carrying the pintle-stud; a tongue-truck connection at each end of said draft-frame, each comprising a projecting bifurcated plate having forwardly-tapered arms or horns with a pintle-receiving space between, and a movable yoke or fastener adapted for automatic elevation, and instant engagement with the pintle-stud of said tongue-truck when backed into said receiving-space, and means under control of the attendant for retracting said fastener and thereby detaching said tongue-truck, for the purposes set forth.

3. In a tongue-truck-attaching appliance, the connection-plate having a pintle-seat and forwardly-open mouth leading into said seat, the side portions fitted with lugs or shoulders *m*; and the upwardly-swinging yoke, its arms loosely hinged on said plate, its fore part having a forwardly upwardly inclined projection, an inner seat for embracing the pintle-stud, and its outer angles fitted with surfaces *n* that engage or abut on said shoulders, in combination with the tongue-truck having the pintle-stud fixed thereon.



4. In a tongue truck-attaching appliance, the pintle-stud rigidly fixed upon the tongue-plate, said stud having a head or flange that projects rearward and laterally beyond the cylindrical body of the stud, but presenting no projection at its forward side; in combination with the connection-plate provided with a pintle-seat recess with a semicircular flange or lip over which said head engages; and a yoke or drop-fastener adapted to fall in front of said pintle-stud for retaining said pintle with said head and lip in conjunction, substantially as set forth.

601,820. BREECH-LOADING FIREARM. REINHARD T. TORKELSON, Worcester, Mass. Filed Mar. 18, 1893. Serial No. 466,732. (No model.)

Claim.—1. In a gun, the combination of a trigger 10 and a sear 12 formed in separate pieces, and mounted on the same shaft, the trigger-body being cut away along its upper edge to present a long working shoulder, and being provided with an overhanging lug 14, the sear fitting under, and being held in place by the lug 14, and having a long working face to rest upon the shoulder of the trigger-body, substantially as described.

2. In a gun, the combination of a trigger, a hammer, and a safety-slide 30 formed of a spring-metal body having an integral spring-catch 31 adapted to hold the safety-slide in one of two positions, an integral spring-finger 36 adapted to be engaged by the hammer, a finger-piece or push 31 extending outside of the gun-casing, and an arm 35 secured to the slide by being headed into the same, and adapted to engage the trigger, substantially as described.

3. The combination in a gun of the framing, the barrels pivoted thereto, the hammers, the firing-pins, the triggers, the cocking-lever for cocking the hammers as the gun is broken, a vertical shaft having a lever or snap at its upper end, and suitably connected at its lower end to operate a sliding locking-bolt for locking the barrels and framing together, of pins or projections on the hammers, adapted to be engaged by the locking-bolt so that the first part of the unlocking movement of the locking-bolt tends to move the hammers away from the firing-pins, and that thereafter the hammers are cocked by the breaking of the gun, the locking-bolt being moved far enough forward, when the same is in position to lock the frame and barrels together that the pins or projections on the hammers, will not strike the locking-bolt as the hammers are sprung, substantially as described.

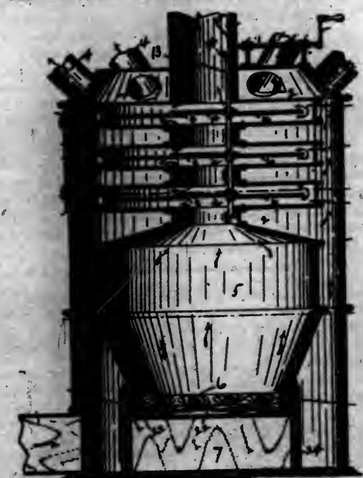
4. In a gun, means for holding the locking-bolt in one position, consisting of the cylinder 45 having an ear 46 adapted to fit into the framing, the pin 48 fitted into the cylinder, said pin being slabbed at 49, and the edge of the cylinder being forced in at 50 to engage the slabbed portion of the pin to prevent the pin from being removed from the cylinder, and a spring 51 mounted behind the pin, substantially as described.

5. In a gun, the combination of the locking-bolt having the inclined cam-shoulder 39 and a tooth 40 arranged upon the upper surface of the locking-bolt, and the vertical operating-shaft 41 having a downwardly-projecting rib or tooth 43 which fits between said cam-shoulder 39 and the tooth 40 whereby the locking-bolt can be moved positively in either direction, the tooth 40 being curved so as not to interfere with the rearward motion of the locking-bolt, substantially as described.

6. In a gun, the combination of the framing, the barrels pivoted thereto, of a slide 59 having a dovetailed projection fitting into a dovetailed way in the framing, and being held in place by a screw 61 carried by said slide, and fitting into a groove in the framing, a friction-spring mounted in a recess in said slide, the slide being so arranged that when the screw 61 is removed, the slide can be moved back far enough so that it can be disengaged from the dovetailed way, the triggers and hammers, a pivoted cocking lever, a pivoted cam carried by the barrels, and adapted to actuate the cocking-lever, and to be engaged by the slide 59 so that it may be moved from its engagement with the cocking-lever, substantially as described.

7. The combination in a gun of the framing carrying the breech mechanism, of the barrels pivoted to the framing, the extractor mounted in the barrels, the extractor-lever, said extractor-lever being mounted in a slotted block 67 on the pins 69, said slotted block being fixed with relation to said barrels, thus forming a bearing for the extractor-lever, which can be replaced without replacing the entire fire-arm, the extractor-lever being adapted to bear on part of the framing to actuate the extractor, substantially as described.

601,821. BALL-BEARING FOR CYCLES OR VELOCIPEDES. WILLIAM W. TOURJÉE, Hartford, Conn. Filed June 28, 1897. Serial No. 642,567. (No model.)

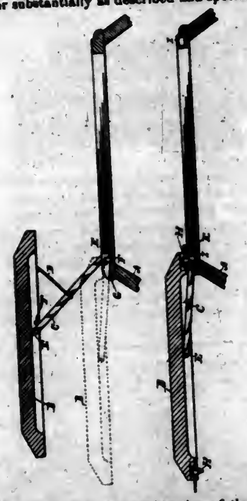


Claim.—1. A ball-bearing member consisting of an externally-threaded section having a raceway and an internal thread adjacent to said raceway; a ball-retainer seated in said section and provided with a series of recesses to receive and retain the balls; and an externally-threaded cap fitted within the first-named section and serving to secure the ball-retainer in position.

2. The combination of a shaft; a casing surrounding said shaft; a bearing consisting of two sections secured, respectively, to the shaft and casing and having bearing-surfaces, the bearing-section carried by the casing having an annular seat; a disk loosely fitted in said seat and having a central aperture to receive the shaft and also having a series of substantially elliptical sockets extending from the wall of the aperture; and a series of balls disposed in said sockets.

3. A retainer for bearing-balls, consisting of a plate having an aperture and a series of substantially elliptical recesses communicating with the aperture.

601,822. HOT-AIR FURNACE. JAMES T. WARREN, Buffalo, N. Y. Filed Nov. 13, 1897. Serial No. 658,341. (No model.)



Claim.—In a hot-air furnace the combination with the fire-box and smoke-pipe, of a series of separated drums communicating with each other and with the fire-box and smoke-pipe and arranged within the hot-air chamber, a series of diaphragms of less diameter than the drums and centrally arranged therein whereby the heat generated in the fire-box has passing contact with the entire radiating-surface of the drums, and a series of openings in the diaphragms and a series of dampers operating with the openings in the diaphragms to produce a direct draft from the fire-box to the smoke-pipe when desired.

601,828. BURIAL-CASKET. OSCAR M. ALLEN, Kalamazoo, Mich. Filed Apr. 23, 1896. Serial No. 588,705. (No model.)

Claim.—1. In a burial-casket the combination of the body portion A; the lid B, with recesses on its under side; links C, pivoted at each end with the pivots E, one of which is located in a recess in the lid and the other of which is located in the side of the opening in the top; adjustable bolts F, with shoulders F', thereon located in the lid and on the top in position to project into the path of the links for adjusting the same; a hook D, on the lid positioned to hook under a link to sustain the top in the level position; catches on the lid positioned to engage catch-plates on the body to fasten the lid and to adjust the same on a level with the top in the open position all coacting together substantially as described for the purpose specified.

2. In a burial-casket the combination of the body portion A;

the lid B, with recesses on its under side; links C, pivoted at each end with the pivots E, one of which is located in the recess in the lid and the other of which is located in the top; catches on the lid positioned to engage catch-plates on the body to fasten the lid and to hold the same on a level with the top in the open position all coacting together substantially as described and specified.

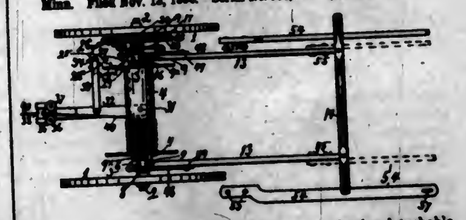
3. In a burial-casket the combination of the body portion A; the lid B, with recesses on its under side; links C, pivoted at each end with the pivots E, one of which is located in a recess in the lid and the other of which is located in the opening in the side of the top; adjustable bolts F, with shoulders F', thereon located in the lid and on the top in position to project into paths of the links for adjusting the same; the hook D, on the lid positioned to hook under a link to sustain the top in the level position all coacting together as described for the purpose specified.

601,824. VELOCIPEDE DRIVING-GEAR. GERALD BARKER, London, England. Filed Nov. 27, 1896. Serial No. 613,517. (No model.) Patented in England Nov. 16, 1894, No. 22,151; in France Aug. 20, 1895, No. 248,956; in Belgium Aug. 20, 1895, No. 117,235, and in Germany Sept. 7, 1895, No. 86,700.

Claim.—In velocipede driving-gear, the combination with the main cranks, of secondary cranks mounted thereon provided with planet-wheels, and stationary externally-toothed sun-wheels with which said planet-wheels engage, said sun and planet wheels being of the same size, and pedals upon the secondary cranks.

601,825. APPARATUS FOR SHAPING METAL WARE. TIMOTHY CONNERS, Portland, Conn., assignor to the American Stamping Company, New York, N. Y. Filed May 17, 1897. Serial No. 636,572. (No model.)

Claim.—In apparatus for the manufacture of swelled ware, the externally-tapered dies B B', recessed to conjointly present the circular bottom space *c*, a plate C adapted for said space, together with the confining-ring D, and rubber filling E, in combination with the punch H and flange-holding die G of a die-press, all arranged for joint operation substantially as herein specified.



601,826. VEHICLE-TIRE. GEORGE W. CROSS, Pittston, Pa. Filed June 12, 1897. Serial No. 640,409. (No model.)

Claim.—1. A vehicle-tire having an annular recess and side recesses, and a spring or springs embedded in said tire, substantially as set forth.

2. A vehicle-tire having an annular recess or recesses, and two parallel springs embedded in said tire, substantially as set forth.

601,827. HAND-CART. GUSTAF A. DAHLBERG, New Sweden, Minn. Filed Nov. 12, 1896. Serial No. 611,977. (No model.)

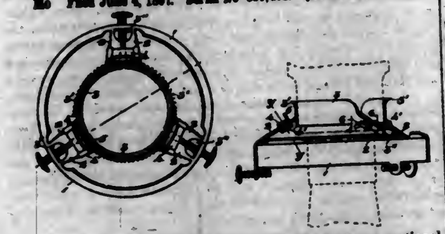
Claim.—1. A combined hand and horse cart, having detachable shafts for the horse, adapted to be readily attached to the shafts used for hand-power, substantially as set forth.

2. In a wire-cart, the combination with a pair of ground-wheels, axle and frame carried thereby, a wire-reel mounted on the frame and operatively connected with one of the ground-wheels, a shunting-lever pivoted in the frame and carrying at one end rollers for guiding the wire onto the reel, a pitman pivoted to said lever, the crank-wheel 27 operating the pitman and having teeth upon its periphery and a spiral-toothed wheel engaging said teeth, and being secured to one of the traction-wheels, is thereby revolved, and operates the shunting-lever, substantially as set forth.

3. In a hand-cart the combination of a pair of ground-wheels, a frame carried thereby, a wire-reel mounted in the frame and a swinging arm for guiding the wire onto the reel, said arm being provided with four friction-rollers or guiding-sheaves between which the wire passes, and means for swinging the arm by the revolving of one of the ground-wheels, substantially as shown and described.

4. A hand-cart having a pair of ground-wheels and a frame carried thereby, and a pair of shafts projecting from the frame and connected together by a handle as 14, said shafts being adjustably secured to the frame, so that they may readily be raised and lowered relatively to the frame, by the extensible braces 48, substantially as and for the purpose described.

601,828. LEATHER AND RUBBER SUBSTITUTE. ORRIN R. DUREN, Boston, Mass., assignor of one-half to Charles Curtis, Newton, Mass. Filed July 1, 1897. Serial No. 643,092. (No specimens.)



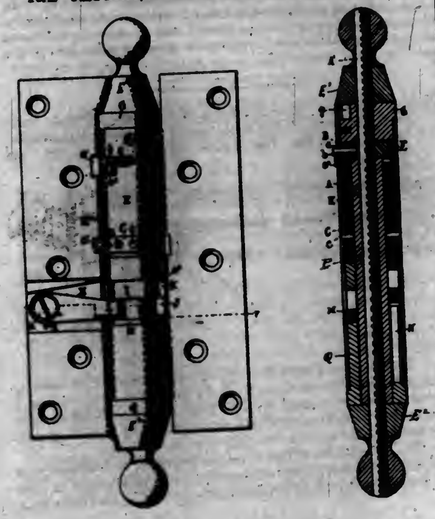
Claim.—1. The improved of making a substitute for leather or rubber, consisting in first drying a mass of chemical wood-pulp, then separating the individual dry fibers to bring the mass to a flocculent state, then mixing the flocculent fibers with a mass of rubber cement and pulverized mineral, and then forming the mixture into the shape desired and subjecting it to a degree of heat which is less than that usually employed for vulcanization.

2. The improved method of making a substitute for rubber or leather, consisting in first drying a mass of chemical wood-pulp, secondly separating the individual dry fibers to bring the mass to a flocculent state; thirdly, mixing the flocculent fibers with a mass of rubber cement and a pulverized mineral; fourthly, spreading the mixture into a relatively thick sheet, fifthly, subjecting the sheet to a degree of heat which is less than that usually employed for vulcanization, and lastly, compressing the sheet.

3. A compacted sheet of material consisting of chemical wood fibers uniformly mixed with and enveloped in a firmly-adherent mass of cured rubber and pulverized mineral.

4. As an article of manufacture, a vehicle-tire composed of compacted material, said material consisting of chemical wood fibers uniformly mixed with and enveloped in a firmly-adherent mass of cured rubber and pulverized mineral.

601,829. SHADE-HOLDER. MORRIS D. GREENBARD, St. Louis, Mo. Filed June 4, 1897. Serial No. 639,471. (No model.)



Claim.—1. In a shade-holder, a suitable shade-ring, a sectional clamping-band forming a part thereof, a series of pairs of flat webs having outer inclined edges connecting the sections of the clamping-band to the shade-ring, a slide having rounded terminal portions embracing the webs, the bases of the webs being cut away to increase the resiliency of the same, substantially as set forth.

2. In a shade-holder, a suitable shade-ring, a clamping-band, webs connecting the band to the shade-ring, the bases of the webs being cut away at their juncture with the shade-ring, substantially as set forth.

3. In a shade-holder, a shade-ring, a clamping-band, and flat webs having outer inclined or diverging edges connecting the shade-ring to the clamping-band, the bases of the webs being cut away at their juncture with the shade-ring, substantially as set forth.

4. In a shade-holder, a suitable shade-ring, a sectional clamping-band forming a part thereof, a series of pairs of flat webs rigidly connecting the sections of the band to the shade-ring, the webs having outer inclined edges normally diverging from the shade-ring toward the clamping-band, a slide embracing each pair of webs and adapted to draw the same together upon movement thereof in one direction, the flat faces of the webs being inclined to the planes of the circles of the shade-ring and clamping band, substantially as set forth.

601,830. DOOR-CHECK. CHARLES F. HARRINGTON, New York, N. Y., assignor to the Mechanical Door Hinge Check Company, of New York. Filed Nov. 3, 1896. Serial No. 610,965. (No model.)

Claim.—1. A door-check consisting of a hinge having in combination interfering projections carried by the opposite parts of the hinge, engaging with each other before the door is completely closed so as to check the closing movement, and moved out of engaging position after the door is checked to permit the final closing of the door, substantially as set forth.

2. In a door-check whose elements are attached to a door-hinge, the combination of a check-pawl, a channel in which the said check-pawl travels, a shoulder in the path of travel of said pawl, a channel or chamber into which the said pawl may pass after striking against the said shoulder, and means for causing said pawl to strike said shoulder and for causing said pawl to pass into said chamber, as the door is closed, substantially as set forth.

3. In a door-check whose elements are attached to a door-hinge, the combination of a check-pawl, a channel in which the said check-pawl travels, a shoulder in the path of travel of said pawl, a channel or chamber into which the said pawl may pass after striking against the said shoulder, and means for causing said pawl to strike said shoulder and for causing said pawl to pass into said chamber, and means for decreasing the sharpness of the blow of the said pawl upon the said shoulder, substantially as set forth.

4. In a door-check whose elements are attached to a door-hinge, the combination of a check-pawl, a channel in which the said check-pawl travels, a shoulder in the path of travel of said pawl, a channel or chamber into which the said pawl may pass after striking against the said shoulder, and means for causing said pawl to strike said shoulder and for causing said pawl to pass into said chamber, means for allowing a yielding movement to said shoulder under the blow of said pawl, and a device for retarding the movement of the door while swinging to, having means for suddenly decreasing the opposition of said device to the closing movement of the door before it is fully closed, substantially as set forth.

5. The combination of the leaves of a door-hinge with a check-pawl, a channel in which said check-pawl moves, having an offset *i*, and a chamber K, a shoulder formed in said channel means for holding the said pawl so as to strike said shoulder, springs connected with said shoulder, permitting it to give under the blow of said pawl, and means for causing said pawl to pass into said chamber K, after its contact with said shoulder, substantially as set forth.

6. In a door-check, a combination with the leaves of a door-hinge, of a spring-actuated check-pawl attached to one leaf of the hinge, a catch-lever adapted to hold said check-pawl against its spring, a channel in the body of the hinge in which the end of said check-pawl travels, a leg in said channel for operating the catch-lever, a shoulder held by a spring in said channel and capable of a yielding movement when struck by said check-pawl, and a chamber connected with the channel into which said check-pawl may pass when not held by the catch-lever against its spring.

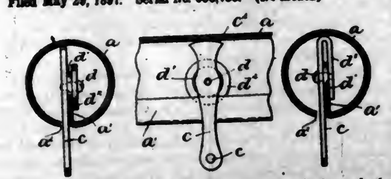
7. The combination of the leaves of a door-hinge and a door-checking device operating to bring the door to a full stop before it is shut with a spring connected to said leaves and means for adjusting the tension of the said spring, and means for increasing its tension on the opening of the door and partially releasing said tension when the door has reached a predetermined position, substantially as set forth.

8. The combination of the leaves of a door-hinge and a door-checking device operating to bring the door to a full stop with a spring A, connected to said leaves and operated by the movement thereof, a pawl F for holding said spring, the lug, *b*, adapted to be caught by spring-catch for holding said spring, and the pin, *g*, for tripping said pawl, and releasing said spring, substantially as set forth.

9. In a door-check the combination with a door-checking device having a check-pawl of a movable block, having a shoulder against which the check-pawl of the checking device strikes, and spring or springs connected with said block so as to allow the same yielding movement under the contact of said check-pawl, substantially as set forth.

10. In a door-check the combination with a door-checking device having a check-pawl of a movable block, and a shoulder against which the pawl of the checking device strikes, spring or springs connected with said block so as to allow the same a yielding movement under the contact of said pawl, and means for limiting the movement of said block against said springs, substantially as set forth.

11. The combination of the leaves of a hinge with a door-check substantially concealed in the structure of the hinge, and having a check-pawl working in a channel and adapted to impinge upon a shoulder in said channel, and springs connected with said shoulder and allowing the same a yielding movement, and a spring for retarding the closing movement of the door, having means operated by the opening movement of the door for increasing the strength of said spring, and means operated by the closing of the door for partially releasing said spring when the door is at a predetermined position, substantially as set forth.



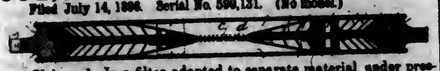
601,881. CORNER-BUFFER FOR TRUNKS. JOSIAH W. HAYDEN, Jr., Boston, Mass. Filed Oct. 13, 1897. Serial No. 655,095. (No model.)

Claim.—1. A corner-buffer for trunks, comprising a pyramidal frame having attaching extensions and intermediate guide portions to embrace the corner edges of the trunk, said frame having an opening at the apex and an adjacent enlarged internal seat, a yielding disk located in said seat and provided with an outer recessed face, and a substantially hemispherical metal buffer mounted in the disk and extended through the apex-opening of the frame, substantially as described.

2. A corner-buffer for trunks, comprising a pyramidal frame having attaching extensions and intermediate guide portions to embrace the corner edges of the trunk, said frame having an opening at the apex and an adjacent enlarged internal concaved seat, a yielding disk having a convex periphery, and a recessed outer face, and a hemispherical metal buffer mounted in the outer face of the disk and with its convex surface extended partially through the apex-opening of the frame, substantially as described.

601,882. CURTAIN-POLE. ALBERT F. HENDERSON, Boston, Mass. Filed May 29, 1897. Serial No. 638,753. (No model.)

Claim.—1. The combination with a curtain-pole formed of sheet metal bent into tubular form with a single inwardly-projecting flange or track a' and a longitudinal slot, of a carrier consisting of a hanger passed through said slot into the interior of the said pole, and provided with a roller entirely inclosed by the said pole and resting upon said flange or track said hanger and said pole being constructed and arranged to coact in holding the roller from being displaced from the track.



2. The combination of a curtain-pole formed of sheet metal bent into tubular form with a single inwardly-projecting flange or track located entirely inside thereof, and having a longitudinal slot, and a carrier consisting of a hanger passed through said slot into the interior of the pole and resting upon the flange or track, said hanger having means for holding the roller on the track.

3. The combination with a curtain-pole formed of sheet metal bent into tubular form with a single inwardly-projecting flange or track a' and a longitudinal slot, of one or more carriers, each consisting of a hanger passed through said slot and provided with a roller resting upon said flange or track, said hanger having its upper portion extended beyond the roller into proximity to the inner wall of the pole for the purpose set forth.

4. The combination with a curtain-pole formed of sheet metal bent in tubular form with a single inwardly projecting flange or track, of a carrier consisting of a hanger having its upper portion doubled upon itself, and a roller resting and rolling upon the said flange or track, and journaled in the doubled portions of the hanger.

5. The combination with a curtain-pole formed of sheet metal bent into tubular form with a single inwardly-projecting flange or track a' and a longitudinal slot, of a carrier consisting of a hanger passed through said slot into the pole, a roller resting and rolling upon said track, a screw for journaling said roller on the hanger, and means coacting with the body of the hanger for holding the roller on the said track, said hanger having its upper portion in proximity to the upper interior wall of the tube and curved as at c^3.

601,883. FILTER-PRESS. ELI E HENDRICK, Carbondale, Pa. Filed July 14, 1896. Serial No. 599,131. (No model.)

Claim.—1. In a filter adapted to separate material under pressure, the combination of a series of press elements arranged in series, each element comprising a ring or annulus, a filtering medium removably connected therewith and having a substantially central opening, and a detachable locking-ring for securing said filtering medium to said ring or annulus, substantially as set forth.

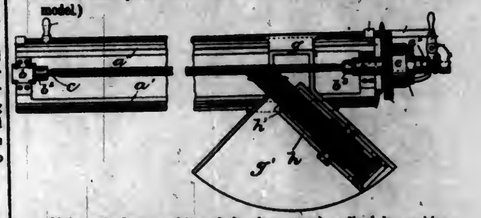
2. In a filter-press element of the character described, the combination of a ring or annulus having an interior flange, a series of filter-plates removably secured to the same and supported thereby, (said series comprising a central vertically-corrugated plate and two adjacent perforate plates on both sides thereof) all of said plates having a central opening for the passage of the liquid under pressure, and two blankets secured together at said central opening and covering said plates and resting on the ring or annulus, substantially as described.

3. In a filter-press element of the character described, the combination of a ring or annulus provided with an interior flange, a filter-plate supported on said flange, a locking-ring cooperating with the ring or annulus for securing said plate in position, said plate having a central opening for the passage of the liquid under pressure, and two blankets secured together at said central opening and covering said plate and resting on the ring or annulus, substantially as set forth.

4. In a filter-press element of the character described, the combination of a ring or annulus provided with an interior flange, a filter-plate supported on said flange, a locking-ring for securing said plate in position, means for detachably securing said locking-ring to the ring or annulus, said plate having a central opening for the passage of the liquid under pressure, and two blankets secured together at said central opening and covering said plate and resting on the ring or annulus, substantially as described.

5. In a filter-press element of the character described, the combination of a ring or annulus provided with an interior flange, a series of filter-plates supported on said flange, (said series comprising a central corrugated plate and two perforate plates on both sides thereof,) all of said plates having a central opening for the passage of the liquid under pressure, a locking-ring cooperating with the ring or annulus for securing said series of plates in position, and two blankets secured together at said central opening and covering said plate and resting on the ring or annulus, substantially as described.

6. In a filter-press element, the combination with a ring or annulus having internal lips, of a filtering medium within said ring or annulus and a locking-ring coacting with said internal lips to secure said filtering medium to said ring or annulus, substantially as described.



7. In a filter-press element, the combination with a ring or annulus having internal lips beveled at their ends, of a filtering medium and a locking ring coacting with said internal lips to secure said filtering medium to said ring or annulus, substantially as described.

8. In a filter-press element, the combination with a ring or annulus having internal lips, of a filtering medium and a locking-ring, having rabbets or grooves coacting with said internal lips to secure said filtering medium to said ring or annulus, substantially as described.

9. In a filter-press element, the combination with a ring or annulus, of a filter plate or plates, a locking-ring for securing removably said plate or plates in position, and a disk of fabric, substantially as described.

10. In a filter-press element, the combination with a ring or annulus having an outlet for the filtered material, of a filter plate or plates having hollow bosses, a locking-ring for securing said plate or plates in position and a blanket of fabric on either side of said plate or plates, substantially as described.

601,884. MACHINE FOR MAKING VEHICLE-TIRES. FREDERICK W. HEBETH, Boston, Mass., assignor to the Consolidated Rubber Works, same place. Filed Apr. 30, 1897. Serial No. 634,607. (No model.)

Claim.—1. In a machine of the character described, in combination, a bed, a mandrel thereon, means for rotating the mandrel, a carriage mounted to slide upon the bed, means for sliding the carriage, a warp beam mounted upon the carriage, and a liquid-receptacle also mounted upon the carriage to move therewith.

2. In a machine of the character described, in combination, a bed having parallel guides, a mandrel, a carriage arranged to slide on the parallel guides of the bed, means for sliding said carriage, a liquid tank or receptacle mounted upon the said carriage, and a warp-beam also mounted upon the carriage, said receptacle and said beam being adjustable relatively to the mandrel.

3. In a machine of the character described, in combination, a bed-frame having parallel guides, a carriage arranged to slide upon said guides, a mandrel mounted upon the said frame, a liquid tank or receptacle mounted upon said carriage, a warp-beam journaled upon said carriage, and means for conducting the threads therefrom through the liquid in the tank to the mandrel.

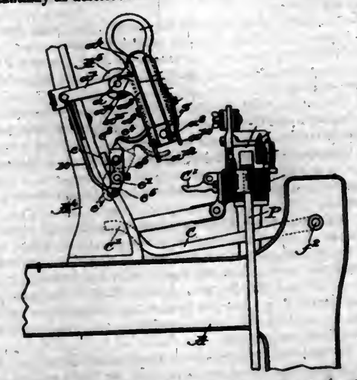
4. In a machine of the character described, in combination, a a bed-frame, a mandrel thereon, a carriage arranged to slide upon the bed-frame, a warp-beam mounted upon the carriage, and adjustable means mounted upon the carriage for varying the width of the warp.

5. In a machine of the character described, in combination, a bed-frame, a mandrel thereon, a carriage arranged to slide upon the bed-frame, a warp-beam mounted upon the carriage, and an adjustable comb mounted upon the carriage for varying the width of the warp.

601,885. BATH-GOWN. HARTLAND LAW and HERBERT H. LAW, San Francisco, Cal. Filed Aug. 4, 1897. Serial No. 647,078. (No model.)

Claim.—1. A bath-gown composed of flexible material and provided with a body portion having side openings extending the width of the gown and downward from the shoulder portion thereof, a rear portion, a front portion of greater length than the rear portion, tapering side portions connected to the front and rear portions at their lower ends and extended at their upper ends to form the lower portion of the sleeve, tapering sleeve portions to form the upper portion of said sleeves, and means for contracting the neck and outer ends of the sleeve portions; substantially as specified.

2. A bath-gown comprising front, bottom and rear portions, said front portion being of greater length than the rear, tapering side portions secured to the front, bottom and rear portions at their lower ends to form side openings extending the width of the gown downward from the shoulder portion thereof, tapering sleeve portions secured to the upper ends of the front, rear and side portions, and means for contracting the outer ends of said sleeve portions; substantially as specified.



601,886. SHUTTLE-CHANGING MECHANISM FOR LOOMS. CHARLES A. LITTLEFIELD, Lowell, Mass., assignor to the Northrop Loom Company, Saco, Me., and Hopedale, Mass. Filed Dec. 4, 1896. Serial No. 614,498. (No model.)

Claim.—1. A loom containing the following instrumentalities, viz: a lay having a shuttle-box; a filling-detector; a movable shuttle-feeder independent of the lay; a shuttle-transferrer operative upon failure of the filling to transfer a shuttle from the shuttle-feeder to the shuttle-box, and connections between the transferrer and shuttle-feeder to move the feeder into position for the transfer of a shuttle, substantially as described.

2. A loom containing the following instrumentalities, viz: a lay having a shuttle box; a filling-detector; a movable shuttle-feeder independent of the lay; a shuttle-transferrer, and means independent of the lay and operative upon failure of the filling to move the shuttle-feeder in unison with the lay and to effect the transfer of a shuttle from the feeder to the shuttle-box, substantially as described.

3. A loom containing the following instrumentalities, viz: a lay having a shuttle-box; a filling-detector; means independent of the lay to support a fresh shuttle; a transferrer, including a rock-shaft, located at the rear of the lay-path, and mounted independently of the shuttle-supporting means, and fingers on said rock-shaft, adapted to engage and transfer a shuttle from its supporting means to the shuttle-box upon failure of the filling, substantially as described.

4. A loom containing the following instrumentalities, viz: a lay having a shuttle-box; a filling-detector; and a shuttle-feeder pivotally mounted above and independent of the lay, and adapted to be moved in unison therewith for a part of its stroke, in juxtaposition to the shuttle-box, combined with a transferrer mounted on a stationary part of the loom, means operative upon failure of the filling to actuate the transferrer and transfer a shuttle from the feeder to the shuttle-box while said feeder is moving in unison therewith and means to move the feeder by or through operation of the transferrer, substantially as described.

5. A shuttle-feeder for looms, comprising end guards having openings therein through which the extremities of a shuttle project, yielding detents to retain and also support the shuttle in the feeder, and side guides to direct the exit of a shuttle, substantially as described.

6. In a loom the following instrumentalities, viz: a lay having a shuttle-box; a movable shuttle-feeder independent of the lay and having an open bottom; yielding detents to engage the lowermost shuttle and retain it in the feeder; an independently-supported transferrer having fingers to engage the projecting ends of the lowermost shuttle and transfer it to the shuttle-box; and means operative upon failure of the filling to move the shuttle feeder in unison with the lay and at the same time effect the transfer of a shuttle, substantially as described.

7. In a loom adapted to renew its supply of filling when necessary, the lay having a receiving shuttle-box at one end and an ejecting shuttle-box at the other end; a movable shuttle-feeder independent of the lay and adjacent the receiving shuttle-box, containing a supply of shuttles each with its filling; a filling-detector; means to effect the ejection of the spent shuttle; and means independent of the lay, to move the shuttle-feeder in unison with the lay and transfer a fresh shuttle from the feeder to the receiving shuttle-box, said means operating simultaneously upon failure of the filling, substantially as described.

8. In a loom provided with means to renew its supply of filling when necessary, the lay, a shuttle-box thereon provided with two throats, one above the other, means to direct the exit of a shuttle from the box through one of said throats, and across the lay, or through the other throat to be ejected, and a filling-detector, to control the operation of said shuttle-directing means, substantially as described.

9. In a loom provided with means to renew its supply of filling when necessary, the lay, a shuttle-box thereon provided with two throats, one above the other, and a movable bottom, means to move the bottom to direct the exit of a shuttle from the box through either of said throats and a filling detector to control such means, whereby the shuttle when thrown from the said box either travels across the lay or is ejected, substantially as described.

10. In a loom provided with means to supply a fresh shuttle upon failure of the filling, the lay, a filling-detector; a shuttle-box having a shuttle-ejecting throat, and a throat in alinement with the raceway of the lay, a pivoted bottom for said shuttle-box, slotted for the picker-stick, a detent to retain said bottom in normal position, whereby the shuttle when thrown travels across the lay, and a releasing device, controlled by the filling-detector, to release the shuttle-box bottom from its detent upon failure of the filling, and after the entrance of the shuttle into the said box, whereby the shuttle will be shot through the ejecting-throat and ejected at the next stroke of the picker-stick, substantially as described.

11. In a loom provided with means to supply a fresh shuttle upon failure of the filling, the lay having a shuttle-box provided with an

ejecting-throat, a box-bottom mounted to swing vertically, a shuttle-director movable with said bottom, and means operative upon failure of the filling to swing said bottom and move the director to direct the shuttle to said ejecting-throat, to be ejected from the shuttle-box by the picking mechanism at the next pick, substantially as described.

12. In a loom, the lay having a shuttle-box provided with an ejecting-throat and a movable bottom, and a receptacle beneath the lay, combined with means operative upon failure of the filling to move said bottom to direct a shuttle to said throat as it is thrown from the shuttle-box, to be ejected therefrom, into said receptacle, substantially as described.

13. In a loom, filling-supplying mechanism, and mechanism operative upon failure of the filling to effect the delivery of a fresh supply of filling at one end of the loom and to eject the spent filling-carrier at the other end during the back stroke of the lay, substantially as described.

14. In a loom provided with means to furnish a fresh supply of filling, the lay, a shuttle-box thereon, a filling-detector, and means controlled thereby and operative upon failure of the filling, to eject a spent filling-carrier from the shuttle-box by effecting a change in the direction and location of its normal path of movement as it leaves said shuttle-box during the back stroke of the lay, substantially as described

15. In a loom provided with means to furnish a fresh supply of filling, the lay, a shuttle-box thereon, a filling-detector, means controlled thereby and operative upon failure of the filling, to eject a spent filling-carrier in the shuttle-box by effecting a change in the direction and location of its normal path as it leaves the inner end of the said shuttle-box during the back stroke of the lay, and means to restore the shuttle-box to normal condition at the next beat of the lay, substantially as described.

16. A loom containing the following instrumentalities, viz: a lay having a shuttle-box; means independent of the lay to support one or more fresh shuttles, and movable adjacent to and in unison with the shuttle-box when a shuttle is to be transferred; means located at the rear of the lay-path and operative upon failure of the filling, to engage and transfer a shuttle from said supporting means to the shuttle-box, and devices independent of the lay to effect the movement of the supporting means, substantially as described.

17. In a loom provided with means to supply a fresh shuttle upon failure of the filling, the lay having an ejecting shuttle-box, cooperating picking mechanism, and means operative upon failure of the filling to effect a change in the direction of the normal path of movement of the spent shuttle, while the latter is in the ejecting shuttle-box, whereby it will be ejected as it is thrown from the said shuttle-box by said picking mechanism, substantially as described.

601,887. BOBBIN OR UNDER-THREAD CASE FOR SEWING-MACHINES. LEE A. MILLER, Milwaukee, Wis., assignor to The Wheeler & Wilson Manufacturing Company, Bridgeport, Conn. Filed June 18, 1897. Serial No. 641,263. (No model.)

Claim.—1. A bobbin-case having a post and a lever mounted on said post, combined with a starting device having a projection to engage the bobbin surrounding said post, and connections between said lever and starting device to start said bobbin outwardly on said post, substantially as described.

2. A bobbin-case having a post, a starting device presenting a projection outside said post, and a bobbin surrounding said post, and a lever mounted on said post, combined with a link which in the movement of said lever operates said projection, substantially as described.

3. A bobbin-case having a post, a starting device made as a sliding sleeve having a projection, and a bobbin mounted on said sleeve, combined with a lever mounted on said post, and having a link connected with and operating said sleeve, substantially as described.

4. A bobbin-case having a post, a starting device made as a sliding sleeve having a projection, and a bobbin mounted on said sleeve, combined with a lever mounted on said post, and having a link connected with and operating said sleeve, said lever being long enough to overlap the bobbin from its center to the edge of the bobbin-case, the end of the lever entering a notch of the said case, substantially as described.

601,888. MAGAZINE-FIREARM. SAMUEL H. MCCLEAN, Washington, Iowa. Filed Mar. 13, 1891. Serial No. 384,944. (No model.) Patented in England Apr. 7, 1892, No. 6,063; in France June 7, 1892, No. 222,156, and in Germany June 26, 1892, No. 68,699.

Claim.—1. In a breech-loading firearm, a grip-lever, an operating-lever connected to the grip lever, a spring resisting the movement of said levers, a reciprocating breech-block connected to the operating-lever, shell-extractors attached to the breech-block, a vertically-reciprocating cartridge-carrier, a carrier-lever connecting said breech-block and carrier, and a rotating multichambered magazine engaged by the carrier to rotate it.

2. In a breech-loading firearm, a grip-lever, an operating-lever connected to the grip-lever, a spring resisting the movement of said levers, a breech-block connected to the operating-lever, a vertically-reciprocating carrier, a carrier-lever connecting the carrier and the breech-block, and a rotating multichambered magazine having spring-actuated cartridge-followers engaging with the carrier to rotate the magazine.

3. In a firearm provided with a barrel, cartridge-magazine, and stock or handle, the combination of a grip-lever pivotally suspended between the walls of a chamber in said stock or handle, an operating-lever connected by a rod or bar with the said grip-lever, and its lower extremity pivotally connected to the walls of said chamber, a spring bearing on said lever, a breech-block pivotally connected with the upper extremity of said operating-lever, a cartridge-carrier, and a cartridge-carrier-lifting lever, all substantially as shown.

4. In a firearm the combination of a grip-lever pivotally suspended between the walls of the chamber formed of opposite sides of the stock or handle, an operating-lever composed of two parts hinged together and connected by a bar or rod with said grip-lever, its lower extremity pivotally connected with said walls and held in position by a spring, a breech-block pivotally connected with the upper extremity of said operating lever, a cartridge-carrier, a cartridge-carrier-lifting lever, and a hammer, all actuated and operated by the retraction of said grip-lever and by said spring.

5. In a firearm, the combination of a grip lever and an operating-lever connected by a bar or rod each pivotally connected with the opposite walls of the chamber of the stock or handle, a spring resisting the retraction of said levers and restoring them to their normal position, and a breech-block pivotally connected with said operating-lever, said breech-block being provided with projecting pins engaging in grooves in the opposite walls of said chamber, whereby by means of the retraction of said grip-lever and said spring said breech-block may be withdrawn from and returned to its position as breech to the barrel of the firearm as desired.

6. In a firearm the combination of a grip-lever and an operating-lever connected by a bar or rod, each pivotally connected with the opposite walls of a chamber in the stock or handle, a spring resisting the retraction of said levers and restoring them to their normal position, a cartridge-carrier-lifting lever, a breech-block pivotally connected with said operating-lever, and a cartridge-carrier operated by said cartridge-carrier-lifting lever.

7. In a firearm, the combination of a breech-block provided with projecting pins on its opposite sides, near both forward and rear ends, the former pins engaging in horizontal grooves and the latter in vertical and inclined grooves in the opposite walls of the chamber of the stock or handle of said firearm, blocks or plates located and sliding in said horizontal grooves provided with spring-catches whereby the said breech-block is moved backward or forward in said groove, whose depth diminishes and increases at proper distances, the rim or flange of the cartridge is seized by said spring-catches, and the shell or cartridge is extracted, and an operating-lever connected with said breech-block and by the means of which the same is operated.

8. In a firearm, the combination of a rotating cartridge-magazine provided with two or more chambers, a cartridge-carrying device capable of upward and downward movement between the opening of one of the chambers of the magazine and the bore of the barrel, said cartridge-carrying device being operated by an operating-lever mechanism making engagement between the rotating magazine and the cartridge-carrying device, after the last cartridge in the chamber of the magazine has been expelled, whereby the upward movement of the cartridge-carrying device rotates the magazine to the desired

position when another chamber is presented for the ejection and use of the cartridges.

9. In a firearm a rotating magazine having cartridge tubes or chambers, each tube or chamber having a longitudinal groove; a plunger provided with a stock and spring, movable in said tube or chamber, each plunger provided with a pin moving in said groove and capable when said tube or chamber is empty of projecting through a slot in the end wall or partition of the chamber of the stock or handle, in combination with a cartridge-carrying device provided with a vertical plate containing a diagonal or inclined slot, engaging the projecting pin of said plunger, whereby the upward movement of said cartridge carrying device rotates said magazine and brings the next loaded chamber opposite the point of ejection.

10. In a firearm a cartridge carrier having a vertical and a horizontal plate or face, the horizontal plate being provided on each side with dependent arms or wings and having two longitudinal slots, the vertical plate adjusted to move in vertical grooves in the opposite walls of the chamber of the stock or handle, and having a diagonal or inclined slot, in combination with two shells hinged to the central line of the horizontal plate, a pair of sliding bars passing beneath said shells and made integral with a vertical plate, said bars being pivotally connected with rods that passing through the slots in said horizontal plate are pivotally connected with the respective arms or wings thereof, whereby the cartridge ejected from the magazine may be retained or freed in the receipt and delivery thereof by said cartridge-carrier.

11. In a firearm, a breech mechanism, a grip-lever forming a hand grasp substantially as described, pivotally supported in the stock or grip of the weapon and conforming to the contour of said parts and operatively connected to the breech mechanism and means to return the grip-lever to normal position.

12. A grip-lever, movably retained and controlled by the walls of a chamber formed in the stock or handle of a firearm, an operating-lever connected to the said grip-lever, a reciprocating breech-block connected to the said levers, and a spring resisting the movement of said levers, and restoring them to their normal position, the reciprocating of the grip-lever giving a reciprocating movement to the breech-block.

13. In a breech-loading firearm, the combination of a hand grip-lever pivotally mounted in the stock-chamber, an operating-lever connected to the grip-lever and operated thereby, a spring resisting the movement of said levers and restoring them to their normal position, a reciprocating breech-block pivotally connected to the operating-lever, a spring-actuated hammer engaged by said breech-block, and a spring-actuated trigger engaging the heel of the hammer, the grip-lever operating to actuate the operating-lever and breech-block and cock the hammer and the trigger operating to release the hammer.

14. A grip-lever connected to an operating-lever, a spring resisting the movement of said lever and restoring them to their normal position, the said lever connected to a reciprocating breech-block, which breech-block engages with the short arm of a carrier-lever, the long arm of which lever engages with a vertically-reciprocating carrier, a carrier provided on its anterior face with a diagonal groove which engages with a rotating cartridge-magazine, the upward movements of the carrier rotating the magazine, the grip-lever causing a reciprocating movement of the breech-block, a vertically-reciprocating movement of the carrier and a rotating movement of the magazine.

15. A grip-lever provided with a projection or connection for engagement with the operating mechanism of a breech-loading firearm, an operating-lever which is connected to the said grip-lever and is hinged to a reciprocating breech block, a spring resisting the movement of said levers, and restoring them to their normal position, the said breech block engaging with a spring-actuated hammer which engages with a trigger in the usual manner, the said breech-block also engaging with the short arm of a carrier-lever, the long arm of which engages with a vertically-reciprocating carrier, a vertically-reciprocating carrier provided on its anterior face with a diagonal groove, which engages with the rotating cartridge-magazine, the upward movement of the carrier rotating the magazine, the grip-lever giving a reciprocating movement to the breech-block, a vertically-reciprocating movement to the carrier, a rotating movement to the magazine, and a rearward movement to the hammer, the said grip-lever and trigger actuating and discharging the firearm.

16. In a firearm, provided with a stock or handle having a chamber therein, the walls of the stock-chamber having cam-grooves 25, which grooves 25 are of varying depth, a grip-lever provided with a connection for engagement with the operating mechanism of a breech-loading firearm, an operating-lever connected to the said grip-lever, a spring resisting the movement of said levers, and restoring them to their normal position, a reciprocating breech-block connected with the said levers, the breech-piece provided with pins or bearings d'' arranged to engage with spring-extractors, spring-extractors arranged to slide back and forth in the cam-grooves 25, the extractors engaging with the pins d'' and the outer side of the extractors constructed to bear against the bottom of the grooves, the cam action of the grooves causing the extractors to grasp the cartridge as moved forward and to release the shell when fully extracted.

17. A vertically-reciprocating cartridge-carrier having attached to its upper face a cartridge receiver or cradle, the semicylindrical walls of the receiver being fastened to the upper surface of the carrier in the central longitudinal line thereof, the forward ends of these shells being even with the front face of the carrier and constructed to receive the cartridges as they pass out of the magazine into the stock-chamber.

18. In a firearm the barrel, the stock or handle provided with a chamber therein, a grip-lever, an operating-lever movably retained and controlled in its movements by the walls of said chamber, and bars or rods E connecting said grip-lever and operating-lever, in combination with the firing mechanism of said firearm, as set forth.

19. In a firearm, the combination with the grip-lever and the operating-lever suitably connected together, of a reciprocating breech-block and shell extractor attached thereto, said operating-lever actuating said breech-block and said shell-extractor, substantially as set forth.

20. In a firearm the combination with the stock and barrel thereof, and a reciprocating breech-block attached to the operating-lever, of, a grip-lever C, an operating-lever D, bar E connecting the same, and spring S, as set forth.

21. In a breech-loading magazine-firearm, the combination of firing mechanism, a reciprocable breech-block carrying shell-extracting means, a vertically-reciprocating cartridge-carrier arranged between the magazine and barrel, and a spring-controlled hand grip-lever pivotally and yieldingly supported between the walls of the stock-chamber and connected with the breech-block and cartridge-carrier and operative by the compression of the hand to actuate the firing mechanism and thereafter extract the spent shell and bring a fresh cartridge into position at the barrel, substantially as described.

22. In a breech-loading firearm, the combination with the vertically-reciprocating cartridge-carrier and means for actuating it by operating the weapon, of a diagonal groove in the outer wall of the cartridge-carrier and a multichambered rotary magazine, the chambers containing springs against which the cartridges are inserted and having projections on the cartridge-followers thereof to enter the said diagonal groove as the chambers become depleted of cartridges, whereby the reciprocating movement of the cartridge-carrier rotates the magazine, substantially as and for the purpose set forth.

23. In a breech-loading magazine-firearm, a reciprocating breech-block, a reciprocating cartridge-carrier, means for reciprocating the carrier and breech-block, releasable support for the carrier when elevated, comprising a spring-catch having a latch-shaped support in the path of the carrier and a second latch-shaped support in the path of the breech-block.

24. In a breech-loading magazine-firearm, the combination with the reciprocating breech-block, of a vertically-reciprocating spring-actuated cartridge-carrying device and a carrier-lever connecting the breech-block and carrier.

25. In a breech-loading firearm, a grip-lever forming a hand-grasp, a reciprocating breech-bolt connected to the grip-lever, a vertically-reciprocating cartridge-carrier, and a carrier-lever engaging the carrier and engaged by the breech-bolt.

601,889. MAGAZINE BOLT-GUN. SAMUEL H. MCCLEAN, Washington, Iowa. Filed Mar. 23, 1894. Serial No. 505,003. (No model.) Patented in England May 15, 1894, No. 9,537; in France May 17, 1894, No. 236,235, and in Germany May 19, 1894, No. 83,136.

Claim.—1. In a breech-loading firearm, a stock-chamber provided with cam-guides in the walls thereof, a grip-lever connected to the stock or handle and provided with guides, a firing-pin, a breech-bolt, a connection between the breech-bolt and the grip-lever provided with a pin to engage the guides of the stock chamber and the grip-lever, and a sear in the path of the grip-lever to hold the firing-pin, substantially as described.

2. In a firearm, a firing mechanism comprising a grip-lever connected to a reciprocating breech-piece, an immovable guide engaging the connecting medium a movable cam-guide in the grip-lever engaging the connecting medium, a spring-actuated firing-pin carried by the breech-piece and a sear engaging the firing-pin and located in the path of the grip-lever.

3. In a firearm, a stock-chamber provided with cam-guides in the walls thereof, a grip-lever connected to the stock or handle and formed with cam-slots in its upper extremities, a reciprocating breech-bolt, connection between the breech-bolt and the grip-lever provided with pins to engage the guides in the stock-chamber and grip-lever, a firing-pin carried by the breech-bolt, a sear engaging the firing-pin, and a trigger engaging the sear.

4. In a breech-loading firearm, a grip-lever, a reciprocating breech-piece connected to the grip-lever a spring-actuated firing-pin carried by said breech-piece, a sear for engaging the firing-pin, a trigger engaging said sear and a dog to lock and release the grip-lever and the trigger being operative to release the dog and firing mechanism, substantially as described.

5. In a breech-loading firearm, a firing mechanism, comprising a grip-lever, a reciprocating breech-piece connected to the grip-lever, a spring-actuated firing-pin carried by the breech-piece, a sear engaging the firing-pin, and provided with an arm extending through the stock-wall whereby the sear may be disengaged from engagement with the firing-pin.

6. In a firearm, a cartridge-carrier held movably between the walls of the forward end of the stock-chamber, its rear end connected to the walls of the stock to move the rear end of the carrier in an upward and backward direction and its forward end connected to the stock-walls to give the forward end of the carrier an upward and rotary movement, a carrier-lever connected to the carrier, and an operating-lever connected to the carrier-lever, the said carrier having both a reciprocating and rotating movement with relation to the barrel and magazine.

7. In a breech-loading firearm, a grip-lever, a reciprocating breech-piece connected to said lever, a spring-actuated firing-pin carried by said breech-piece, a sear engaging said pin and disengaged from the pin by the grip-lever, a cartridge-carrier having a reciprocating and rotating movement and a carrier-lever connected to the grip-lever, and engaging with the carrier to operate it, substantially as described.

8. In a breech loading firearm, a stock-chamber having cam-guides located opposite the rear end of the magazine and rising into line with the barrel, a cartridge-carrier having pins or lugs on its upper corners to engage the guides, the guides controlling the movement of the carrier to give it a compound reciprocating and rotary motion with relation to the magazine and barrel, and an operating-lever connected to the carrier.

9. In a breech-loading firearm, a grip-lever forming a hand-grasp, substantially as described, pivotally supported in the stock or grip of the weapon and conforming to the contour of said part, a carrier-lever connected to said grip lever and having a cam-guide to engage the cartridge-carrier, and a cartridge-carrier connected to the carrier-lever.

10. In a breech-loading firearm, a grip-lever, a carrier-lever connected to the grip-lever, and a cartridge-carrier supported in stationary cam-guides and connected to the carrier-lever.

11. In a firearm a cartridge-holder having gripping-arms hinged to the sides of a cartridge-carrier, a spring to draw the arms together, a wedge-shaped cam having a reciprocating movement to open and close the arms.

12. In a breech-loading firearm a grip-lever provided with a lug J^3, on its inner forward part, a trigger provided with a catch L' on its inner side thereof, a lock M pivoted to the trigger-plate in front of the trigger to engage therewith to hold it out of engagement with the grip-lever.

13. In a breech-loading firearm, a cartridge-carrier having grooves in its upper side to receive and hold a reciprocating cam, a cartridge-holder hinged to the opposite sides of the carrier and having its upper ends formed to grip the cartridge, and its inner sides converging toward each other, a reciprocating wedge-shaped cam engaged and held on the upper side of said carrier by the grooves and having a reciprocating movement to open and close the cartridge-holder.

14. In a breech-loading firearm, a cartridge-holder having gripping-arms hinged to the side of the cartridge-carrier, a spring to draw the arms together, a wedge-shaped cam having a reciprocating movement to open and close the arms, said cam being in the path of the forward movement of the breech-piece when the carrier is in its upper position, and engaging with a stop when it descends to position in front of the magazine, to reciprocate the cam.

15. In a breech-loading firearm, a reciprocable breech-piece, a spring-actuated firing-pin carried by said breech-piece, a sear for the firing-pin, a cartridge-carrier having a compound reciprocating and rotary motion with relation to the magazine and barrel, a carrier-lever having a cam-guide engaging the carrier, a grip-lever connected with the breech-piece and carrier-lever to operate them, a cartridge-holder connected to said carrier and automatically actuated to open at the barrel and close at the magazine.

16. In a firearm, a grip-lever or hand-grasp, a carrier-lever connected to said grip-lever or hand-grasp, a carrier connected to said carrier-lever, a cartridge-holder connected to said carrier and having gripping-arms to engage the cartridge, a reciprocating cam removable between the said arms to open and close them.

17. In a firearm, a grip-lever a reciprocating breech-piece connected to said grip-lever, a spring-actuated firing-pin carried by said breech piece, a sear engaging said firing-pin, a trigger engaging said sear to disengage it from the firing-pin, a carrier-lever connected to the grip-lever, a carrier connected to said carrier-lever, and having a reciprocating and rotating movement, a cartridge-receiver connected to the carrier and provided with arms which are opened and closed by a reciprocating cam, substantially as described.

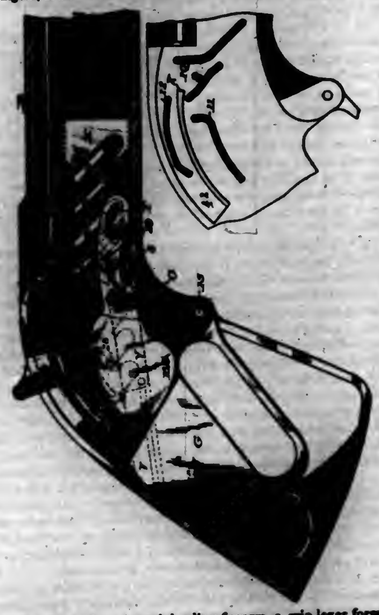
18. In a firearm a cartridge-magazine conveying its cartridges in file containing a spring-actuated cartridge-follower and a longitudinal rack connected to the follower and provided with a series of seats for the ends of a file of cartridges, to maintain the cartridges in regular order substantially as described.

19. In a breech-loading firearm, the combination with the stock-chamber and carrier, of a magazine containing a spring-controlled rack adapted to hold the supply of cartridges in file and locking means substantially as described, for the rack disengaged by the action of the cartridge-carrier to release the rack to feed the cartridges successively to said carrier, substantially as described.

20. In a breech-loading firearm, the combination with the stock-chamber and carrier of a magazine containing a spring-controlled rack, adapted to hold the supply of cartridges in file, and having a scale to indicate the number of cartridges in the magazine, and a locking means for the rack located in the path of the carrier and disengaged by the carrier to successively feed the cartridges into the embrace of the carrier, substantially as described.

21. In a breech-loading firearm the combination of a reciprocating breech-piece, a spring-actuated firing-pin carried by said breech-piece, a sear engaging the firing-pin, a cartridge-carrier having a compound reciprocating motion with relation to the barrel and the magazine, a cartridge-holder having arms to automatically grasp the cartridge as it passes into the stock-chamber, and release it as it passes into the barrel, a grip-lever connected to the breech-piece, a carrier-lever connected to the grip-lever and cartridge carrier to operate them, and a magazine having a spring-controlled rack, said rack being provided with locking means which means are disengaged by the movement of the carrier to allow the magazine to feed the cartridges successively into the embrace of the cartridge-holder, substantially as described.

22. The combination of the magazine, the spring-actuated follower therein, the cartridge-rack connected to the follower, and formed with seats to receive the cartridges, and having pins on the sides thereof, and a guide in the stock-chamber formed with grooves in the sides to take the pins of the cartridge-rack, as and for the purpose specified.



23. A breech-loading firearm having a grip-lever forming a hand grasp, substantially as described, pivotally supported in the stock or grip of the weapon and conforming to the contour of said part as its primary actuating means for loading and firing the weapon, a carrier-lever having a pin-and-slot connection with the grip-lever to permit limited movement of the latter independently of the carrier-lever, substantially as described.

24. In a breech-loading firearm comprising in combination with the barrel and stock or handle containing a chamber, a spring-controlled grip-lever carrying studs and provided with a cam-slot, a breech-piece carrying the firing-pin and an extractor and having a hinged link connection by a pin with said cam-slot and entering a stationary cam guide O, sears for the firing-pin and a thumb-piece on one of the sears, a trigger provided with a locking-dog and an adjustable lock, a carrier-lever having a slot for the stud and adapted to be engaged with said grip-lever and provided with a cam-guide, a cartridge-carrier engaging and controlled by said cam-slot, and stationary cam-guides and provided with a cartridge-holder and a magazine operator to feed the cartridges to the carrier, the whole being constructed and arranged to operate, substantially as described.

25. In a breech-loading firearm, a cartridge-carrier movable between the magazine and the barrel, a movable cam-guide engaging and reciprocating the carrier, and a stationary cam-guide engaged by the carrier.

26. In a breech-loading firearm, a cartridge-carrier engaging with a movable and an immovable cam-guide to reciprocate the carrier, an actuating-lever, and a carrier-lever having a pin-and-slot connection with the actuating-lever and connected to the carrier to control the movements of the carrier.

601,840. MAGAZINE-FIREARM. SAMUEL H. McCLEAN, Washington, Iowa. Filed June 20, 1894. Serial No. 514,120. (No model.)

Claim.—1. In a breech-loading firearm, a grip-lever forming a hand-grasp, hinged to the stock or handle of the weapon, and conforming to the contour of the gripping-hand, and a breech-bolt connected to and carried by said lever.

2. In a breech-loading firearm, a breech-closing mechanism, comprising a swinging hand grip-lever hinged to the stock or handle of the firearm, and having an upper or breech-closing extremity, provided with a slot; a swinging breech-bolt connected to and carried with said swinging grip-lever by a pin which engages with the said slot to give a limited movement to the breech-bolt.

3. A forward locking device for a breech-loading firearm, comprising a stock-frame having a receiver formed as an arc of a circle; a cam-guide in the frame beneath the receiver, the forward end of the guide being eccentric to the movement of the breech-bolt; a breech-bolt formed on the arc of a circle to swing in said receiver; a hand grip-lever hinged to the stock or handle and having cam-slots in its upper end, and a locking-bar hinged at its rear end to the breech-bolt and connected to the grip-lever by a pin which cooperates with the said cam-guides to lock and unlock the breech-bolt in front of the guides and immediately behind the breech.

4. A forward locking mechanism for a breech-bolt, comprising a swinging hand grip-lever hinged to the stock or handle of the weapon; a swinging breech-bolt connected to the grip-lever by a pin and slot to give limited movement to the breech-bolt; a locking-bar hinged at its rear end to the breech-bolt and connected to the grip-lever by a pin and a movable and an immovable cam-guide engaged by said pin to lock and unlock the breech-bolt.

5. In a breech-loading firearm, a receiver having a cam-guide groove which has a varying direction, the cam part of the guideway being eccentric to the path of movement in which the breech-bolt is guided, a breech-bolt movable in the receiver, and shell-extractors attached to the breech-bolt and engaging with the said cam-guide groove to engage and release the cartridge.

6. A stock-frame, in a firearm, having a receiver formed on an arc of a circle, and a cam-guide in the frame, formed with a varying rearward direction; shell-extractors pivoted to a swinging breech-bolt, and provided with a pin to engage the said guide, to cause the extractors to engage with the cartridge, and to move the hooked extremity of the extractors in line with the bore of the barrel.

7. In a breech-loading firearm; a stock-frame having a cam-guide in walls of the receiver, the guide having a rearward and varying direction, and the rear end of the guide having a short curve eccentric to the movement of the breech; shell-extractors attached to a reciprocating breech-bolt, and provided with a pin to engage with said cam, the rear end of the cam causing the extractors to assist in ejecting the shell.

8. In a breech-loading firearm: a carrier-lever pivoted to an operating-lever and connected to a movable cartridge-carrier, and provided with a pin to engage with a guide in the stock-wall to modify the movement of the lever.

9. In a breech-loading firearm, a cartridge-carrier having gripping-arms pivotally supported in the carrier, having a crank to rotate the arms, their upper ends formed to grip the cartridge; a movable slide retained on the upper side of the carrier and connected to the cranks to rotate the arms into and out of engagement with the cartridge.

10. In a breech-loading magazine-firearm, a cartridge-carrier having gripping-arms pivoted to the carrier, and having cranks; a reciprocating slide to engage the arms by means of cam-slots to rotate the arms.

11. In a breech-loading firearm; a firing mechanism, comprising a swinging hand-grip lever; a breech-bolt connected to and carried with the lever; a firing-pin carried by the breech-bolt; and a sear to hold and release the firing-pin.

12. In a breech loading firearm; a firing mechanism, comprising a grip lever; a breech-bolt carried by the grip-lever; a spring-actuated firing-pin carried in the breech-bolt; a sear engaging the firing-pin and located in the path of the movement of the grip-lever, and disengaged by the grip-lever to fire the weapon.

13. In a breech-loading firearm; a stock-frame having guides 9, 10 and 14 in the walls of the stock-chamber; a swinging grip lever hinged to the stock or handle; a carrier-lever pivoted to the grip-lever, and having a pin engaging the guide 14; and a carrier having pins at its forward and rear ends to slide in the guides 9 and 10, the carrier being pivotally connected to the carrier-lever.

14. In a breech-loading firearm; a loading mechanism, comprising a swinging grip-lever pivoted to the stock or handle of the weapon; a breech-bolt connected to and carried with the grip-lever; a carrier-lever connected to the grip-lever by a pin and slot; and a reciprocating carrier connected to the carrier-lever.

15. In a magazine-firearm, a swinging grip-lever hinged to the stock or handle of the weapon; a breech-bolt connected to and carried with the grip-lever; a carrier-lever connected to the grip-lever; a carrier having gripping-arms pivoted in the carrier, and having a crank engaged by a reciprocating slide to rotate the arms; a cartridge-magazine carrying its cartridges in file, and having a rack to maintain the regular order of the cartridges; and a spring engaging the rack and disengaged by the carrier.

16. In a firearm; a cartridge-ejector attached to the upper surface of a cartridge-carrier, and having an upwardly-projecting arm to engage the cartridge, and a laterally-projecting arm to engage with a shoulder on the stock-wall, the upward movement of the carrier actuating it to laterally eject the cartridges.

17. In a breech-loading firearm; a swinging grip-lever pivoted to the stock or handle of the weapon; a breech-bolt connected to and carried with the grip-lever; a carrier-lever connected with the grip-lever; a movable carrier attached to the carrier-lever; and a cartridge-ejector attached to the upper surface of the carrier, and having an upwardly-extending arm to engage the cartridge, and a laterally-extending arm to engage a lug on the side wall to laterally eject the cartridge.

601,841. MAGAZINE BOLT-GUN. SAMUEL N. MCCLEAN, Washington, Iowa. Filed June 5, 1895. Serial No. 551,783. (No model.)

Claim.—1. In a firearm, a reciprocating breech-bolt having a wedge-shaped cam on its under side, a reciprocating handle connected to the said bolt, a vibrating cartridge-carrier having gripping-arms and converging cam-faces on the inner sides thereof, the wedge on the under side of the breech-bolt movable between the arms of the carrier to release the cartridge.

2. In a firearm, a reciprocating handle having a cam-guide which is provided with a double or diamond-shaped forward end, a reciprocating breech-bolt connected to said handle, and a vibrating cartridge-carrier engaging said handle by means of the said guide, substantially as described.

3. In a firearm, a reciprocating handle, a longitudinally-reciprocating breech-bolt having a pin or projection on its under side, a connecting medium H between the said bolt and handle, having a diagonal cam-guide which partially encircles the bolt to reciprocate and rotate it, and shell extractors attached to a collar which encircle said bolt, and a side wall of the receiver having a groove of varying depth the extractors adjusted to bear against the bottom of said grooves to actuate the extractors to grip the cartridge, substantially as described.

4. In a firearm, a reciprocating handle having in its side walls a cam-guideway which is provided with a double or diamond-shaped forward end, a reciprocating breech-bolt connected to said handle, a vibrating cartridge-carrier having gripping-arms for holding the cartridge and engaging with the cam-track in said handle by means of pin P^2 to vibrate it between the barrel and magazine, substantially as described.

5. In a firearm, a reciprocating handle having in its side walls a cam-guideway which is provided with a double or diamond-shaped forward end to hold the carrier in alinement with the barrel until the extractors have gripped the cartridge and started in into the barrel and to permit the breech-bolt to be sufficiently withdrawn before lifting the carrier, a reciprocating breech-bolt connected to said handle, a vibrating cartridge-carrier having gripping-arms for holding the cartridge and engaging with the cam-guideway in said handle to vibrate it between the barrel and magazine, a wedge-shaped projection attached to said breech-bolt and movable between the arms of said carrier to separate them when said bolt is reciprocated, substantially as described.

6. In a firearm, a reciprocating handle having a cam-guideway in its side walls, said guideway having a double or diamond-shaped forward end, a cartridge-carrier having gripping-arms which engage with said guideway by means of pin P^2 to cause a vibrating movement of the carrier, substantially as set forth.

7. In a firearm, a reciprocating handle, a cartridge-rack formed with a series of notches corresponding to the number of cartridges carried by the rack, a dog pivoted in said handle, and arranged to connect with said notches whereby the reciprocating movement of the handle causes a reciprocating movement of the rack, all substantially as described and set forth.

8. In a firearm, a reciprocating handle, a cartridge-rack formed with a series of notches corresponding to the number of cartridges carried by the rack, a dog pivoted in said handle and arranged to connect with the said notches whereby the reciprocating movement of the handle causes a reciprocating movement of the rack, a spring-actuated dog T attached to said handle and a spring-actuated dog engaging said rack and located in the path of movement of the dog T and disengaged by the said dog to release the rack, all substantially as described.

9. In a firearm, a cartridge-rack having a series of notches corresponding to its number of cartridges, a dog engaging said notches, and a slide or feed cut-off engaging the said dog to disengage it from the rack, all substantially as described.

10. A cartridge-magazine located beneath the barrel, a cartridge-rack E formed of sections hinged together and having a series of chambers corresponding to the number of cartridges carried in the magazine, a guide for the said rack extending through said magazine, and the stock in which the rack slides in its reciprocating movement, all substantially as described.

11. In a firearm, a reciprocating handle having a cam track in its side walls, a reciprocating breech-bolt connected to said handle, a cartridge-carrier having gripping-arms engaging by means of the pin P^2 with the cam-guide in the said handle to vibrate the carrier, a cartridge-rack having a series of chambers for its cartridges and a corresponding series of notches on its under side, a cartridge-rack guide D in which the said cartridge-rack is guided, a spring-actuated dog S located in the handle, and movable beneath the said rack located in the said handle and engaging with the notches in the said rack to actuate it, substantially as described.

12. In a firearm, a reciprocating handle having a cam-guide in its side walls, a reciprocating breech-bolt connected to said handle, a cartridge-carrier having gripping-arms engaging the cam-guide in the said handle by means of pin P^2 to vibrate the carrier, a cartridge-rack having a series of chambers for its cartridges and a corresponding series of notches on its under side, a cartridge-rack guide D in which the said cartridge-rack is guided, a spring-actuated dog S located in the handle, and movable beneath the said rack and located in the said handle and engaging with the notches in the said rack to actuate it, an auxiliary dog pivoted to the side walls and located beneath the rack engaging the notches of the rack and disengaged from the rack by the rearward movement of the handle, substantially as described.

13. In a firearm, a reciprocating handle, a reciprocating breech-bolt having diagonal cam-lugs attached to its forward end, the side walls of the receiver having corresponding cam-lugs to engage and lock the bolt, a connecting medium H between the said breech-bolt and the handle having a diagonal cam-slot which partially encircles the bolt, a spring-actuating firing-pin carried by said bolt, a sear engaging said firing-pin, located in the path of the handle and disengaged by the handle to discharge the weapon, all substantially as described.

14. In a firearm, a reciprocating handle having a wedge-shaped forward end a vibrating cartridge-carrier having gripping-arms, and converging cam-faces on the inner sides thereof, the said handle movable between the arms to cause them to grip and release the cartridge, a reciprocating breech-bolt having a diagonal cam-leg attached to its forward end, a side wall of the receiver having corresponding cam-lugs to engage and lock the bolt, a connecting medium H between the said breech-bolt and the handle having a diagonal cam-slot which partially encircles the bolt, a spring-actuated firing-pin carried by said bolt, a button firing device engaging said firing-pin, composed of a sear engaging said firing-pin and having a button to disengage it from said pin, all substantially as described and set forth.

15. In a firearm, a reciprocating handle, a reciprocating breech-bolt connected to said handle, a connecting medium H between said breech-bolt and said handle having a cam-slot partially encircling the bolt, a lock H^6 located across the path of the track H^5 in the part H and engaging the pin J' to lock and release it, a cam-groove A' in the frame having a longitudinal direction beneath the bolt and carving down near its forward end to actuate the said lock to release the pin J' and allow the part H to rotate the bolt, substantially as described.

16. In a breech-loading firearm, a reciprocating and rotating breech-bolt, a stock-frame having a cam-guide A' beneath the bolt, and a bolt-actuating part having a cam-guide encircling the bolt, the said bolt-actuating part engaging the cam-guide of the stock-frame to actuate, lock and release the bolt.

17. In a breech-loading firearm, a reciprocating and rotating bolt, a stock-frame having a cam-guide A' beneath the bolt, and a handle connected with the bolt and engaging the said cam-guide to time the rotating locking action of the bolt.

18. In a breech-loading firearm, a reciprocating breech-bolt having its bolt-head integral with the body part thereof, shell-extractors attached to a collar to encircle the bolt, the said collar formed of relatively-movable sides to permit the extractors to be applied to the bolt between the locking-lugs and the body part of the same.

601,842. MAGAZINE BOLT-GUN. SAMUEL N. MCCLEAN, Washington, Iowa. Filed June 20, 1895. Serial No. 553,493. (No model.)

Claim.—1. In a magazine-firearm, a cartridge-magazine carrying its cartridges in file, a stock-wall having a groove in line with the foremost cartridge in the magazine, a slide movable in the said groove and having a forward hooked extremity extending into the path of the cartridges, and a rearward hooked extremity extending into the path of the breech-bolt, and a reciprocating breech-bolt engaging the said slide to afford a limited movement of the same.

2. In a firearm, a reciprocating handle, a breech-bolt having a reciprocating and rotating movement, a connecting medium between the bolt and the handle having a cam-guide to rotate the bolt, a cartridge-magazine carrying its cartridges in file, a stock-wall having a guide D^4, opposite the foremost cartridge in the magazine, a slide D, movable in said guide-grooves, and engaging with the foremost cartridge in the magazine, and with the said connecting medium to turn the bolt and handle, and a cartridge-carrier to transfer cartridges from the magazine to the barrel.

3. In a breech-loading firearm, a reciprocating handle, having a wedge-shaped forward end, a cartridge-carrier having gripping-arms to engage the cartridge and beveled between the arms, a reciprocating breech-bolt connected to the said handle, and said handle movable between the arms of the carrier.

4. In a firearm, a reciprocating handle, a reciprocating carrier movable between the barrel and magazine and actuated by said handle, a reciprocating breech-bolt, a connecting medium H between said breech-bolt and handle, a dog H' pivoted to the said part H, a stock-frame having a longitudinal cam-groove H^3 to guide the dog H', a cartridge-magazine carrying its cartridges in file and a slide D engaging the foremost cartridge in the magazine and having a rear or hooked extremity in the path of the dog H' and engaged by it to transfer cartridges from the magazine to the carrier, all substantially as described and set forth.

5. In a firearm, a cartridge-carrier movable between the magazine and barrel and having gripping-arms to engage the cartridge, a reciprocating handle movable between said arms and having a wedge-shaped forward end to cause the carrier to open and close, substantially as described and set forth.

6. In a firearm, a breech-bolt having both a reciprocating and rotating movement, a firing-pin movable in a chamber formed on the bolt and having only a reciprocating movement, the connecting part of the pin with the bolt having a cam shape and the connecting part of the bolt with the pin having a cam shape the rotating movement of the bolt bringing it into line with the firing movement of the pin, and a connecting medium H between said bolt and said handle partially encircling the bolt and having a cam-guide to reciprocate and lock it, shell-extractors attached to a collar which encircles the bolt, the stock-wall having converging cam-guides to cause the extractors to grip and release the cartridge, all substantially as described and set forth.

7. In a firearm, a cartridge-magazine carrying its cartridges in file, a spring-actuated follower, a stock-frame having slots O^2 and O^7 and a pin on said follower C' cooperating with these slots in the stock to permit the magazine to be opened for the purpose of filling it, all substantially as described and set forth.

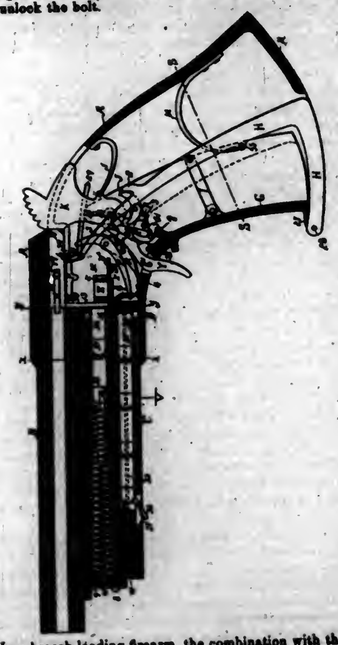
8. In a firearm, a reciprocating handle, a breech-bolt having near its forward end cam-shaped lugs E', a stock-frame having a corresponding cam-shaped lug A', a connecting medium H between said handle and bolt and partially encircling the bolt and connected with it by a cam-guide H^2, which guide has both a straight and a diagonal part to cause both a reciprocating and rotating movement of the bolt and to permit a firing movement of the handle after the locking movement of the bolt is complete, a lock T pivoted to the part H and engaging the pin H^4 and a stock-wall having a cam-guide H^5 to engage the said lock T, all substantially as described and set forth.

9. In a firearm, a reciprocating handle, a reciprocating breech-bolt, a connecting medium between said bolt and handle partially encircling the bolt and having a cam guide to rotate and lock it, a firing-pin movable in a chamber formed in the bolt and having a lug which prevents it from partaking of the bolt's rotation, the face of the pin which connects with the bolt having a cam shape and the face of the bolt which connects with the pin having a corresponding cam shape, the rotating movement of the bolt bringing it into line with the complete firing movement of the pin, a dog L engaging the said spring-actuated firing-pin and located in the path of the handle and disengaged by the handle to discharge the weapon, all substantially as described and set forth.

10. In a firearm, a reciprocating handle, a longitudinally-reciprocating breech-bolt, a spring-actuated firing-pin carried by the bolt, a connecting medium between said bolt and handle which engages with the pin H^4 and employs the action of a cam-guide to reciprocate and rotate the bolt, a sear engaging the firing-pin and a trigger engaging the sear to disengage it from said pin and engaging with said handle by means of the notch K^3 which notch is of sufficient length to allow the trigger to disengage the sear and discharge the weapon, the further movement of the trigger causing said trigger to release the handle, all substantially as set forth and described.

11. In a firearm, a reciprocating handle, a reciprocating breech-bolt connected to said handle, a carrier movable between the magazine and barrel and actuated by said handle, a cartridge-magazine carrying its cartridges in file, a reciprocating slide engaging the foremost cartridge in the magazine, a dog having a hook-shaped extremity and pivotally attached to the connecting medium between the bolt and handle, a stock-wall having a longitudinal cam-guide connected to said wall to cause it to engage, actuate, and release the carrier-feeding slide, a spring-actuated firing-pin carried by said breech bolt, shell-extractors attached to said bolt, a sear engaging the firing-pin and tripped by the handle, substantially as described.

12. In a firearm, a reciprocating handle, a reciprocating dog actuated by said handle, a stock-wall having a cam-guide to engage and control the movement of said dog, a cartridge-magazine carrying its cartridges in file, a carrier-feeding slide engaging the foremost cartridge in said magazine and engaged by the said reciprocating dog the dog having a sufficient forward movement to allow the initial part of the rearward movement of the handle to unlock the bolt before the dog encounters said slide to actuate it to draw a cartridge from the magazine into the receiver, substantially as described and set forth.



13. In a firearm, a reciprocating handle, a reciprocating dog actuated by the said handle, a cartridge-magazine carrying its cartridges in file, a reciprocating slide engaging the foremost cartridges in the magazine and engaged by the said dog to transfer cartridges from the magazine to the carrier, and a pin connected to said slide to draw it out of the path of said dog and cut off the magazine when it is desired to use the weapon as a single-loader, all substantially as set forth and described.

601,848. MAGAZINE-FIREARM. SAMUEL N. MCCLEAN, Washington, Iowa. Filed Apr. 20, 1892. Renewed July 19, 1897. Serial No. 643,103. (No model.) Patented in England Apr. 7, 1892, No. 6,052, and in Germany June 25, 1892, No. 62,660.

Claim.—1. In a breech-loading firearm, an actuating mechanism comprising a grip-lever, a locking-dog engaging the grip-lever, and a trigger engaging the dog to release the grip-lever by the firing movement of the trigger.

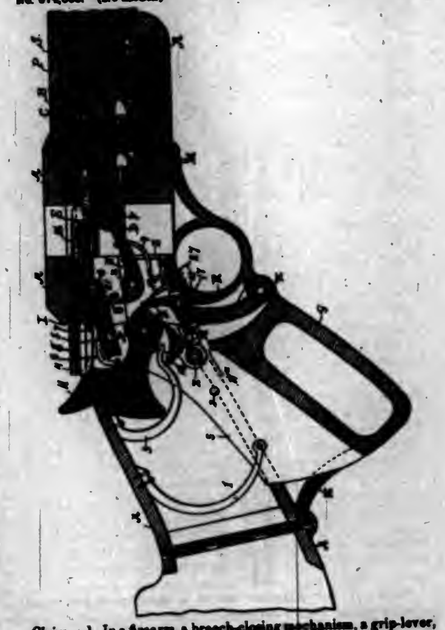
2. In a breech-loading firearm, a grip-lever, an operating-lever

connected to said grip-lever, a reciprocating breech-block, a connecting medium between said breech-block and said levers and a stock-wall having a cam-track to engage the said connecting medium to lock and unlock the bolt.

3. In a breech-loading firearm, the combination with the reciprocating block, of a grip-lever and operating-lever connected together, a guide-groove 29, in the stock-wall a breech-locking bar P, hinged at one end to the breech-block and engaging the said guide-groove, a link connection O, between the end of said locking-bar and operating-lever, and a shoulder on the stock-wall against which the said bar locks, substantially as described.

4. In a breech-loading firearm, the combination with the reciprocating breech-block, of a grip-lever, an operating-lever connected with the grip-lever and with the breech-block, a spring resisting the movement of said levers and restoring them to their normal position, a spring-actuated hammer cocked by the movement of the breech-block, a spring-actuated trigger to engage the hammer, and a spring-actuated secondary sear engaging said hammer and located in the path of the forward movement of the operating-lever.

5. In a breech-loading firearm, a grip-lever an operating-lever connected to the grip-lever, a reciprocating breech-block connected to the operating-lever, a spring-actuated hammer cocked by the movement of the breech-block a sear engaging the hammer, and located in the path of the movement of the operating-lever, and engaged by the operating-lever to discharge the weapon.



6. In a breech-loading firearm, the combination with the reciprocable breech-block, of an operating-lever connected to the breech-block a grip-lever connected to the operating-lever, a spring resisting the movement of said levers to restore them to their normal position, a spring-actuated hammer, a spring-controlled locking-dog to engage and lock the grip-lever, and a spring-actuated trigger connected with said dog to release the grip-lever by the firing movement of the trigger.

7. A cartridge-carrying device for a breech-loading magazine-firearm, said device comprising a reciprocating carrier having cam-guides formed in its horizontal portion and arranged in pairs the members of which are located respectively near the forward and rear ends of the carrier a cartridge-receiver formed in relatively-adjustable sections having lugs to engage the said cam-guides the cam-action of the guides and the reciprocating movement of the cartridge-receiver operating to open and close the same.

8. In a breech-loading firearm the combination with the rotary magazine having tubular chambers containing spring-plungers, of a spring-catch 46 normally locking the magazine against rotation and disengaged by the contact of the spring-plungers, substantially as described.

9. In a firearm, a grip-lever hinged to the stock or handle of the weapon, a spring resisting the movement of the lever, a dog engaging the lever and holding it locked in its forward position, and a trigger engaging the dog to release the grip-lever by the action of the trigger.

601,844. MAGAZINE-FIREARM. SAMUEL H. MCCLEAN, Washington, Iowa. Filed June 17, 1896. Renewed Mar. 15, 1898. Serial No. 674,000. (No model.)

Claim.—1. In a firearm, a breech-closing mechanism, a grip-lever, a reciprocating breech-bolt connected to the grip-lever by a pivot which engages with a movable and an immovable cam-guide, to reciprocate and lock the breech-piece.

2. In a firearm the side walls of the chamber having cam-grooves 21 which grooves have a curved and rearward direction, a grip-lever having lateral walls arranged to pass forward and upward on either side of the operating devices, said walls having cam-slots cut in their upper extremities, a breech-locking pin which passes through the said cam breech-locking slots and extends into said curved grooves 21, a breech-locking bar which is hinged to a reciprocating breech-bolt and connected to said breech-locking pin, a locking-shoulder fixedly attached to the stock-wall which engages with the said breech-locking bar N.

3. In a breech-loading firearm, a breech-locking mechanism, comprising a frame-wall having a cam-guide located beneath the breech-bolt and a shoulder against which the breech-bolt is locked, a reciprocating breech-bolt, a grip-lever having a cam-guide in its upper extremity, a connecting-bar between the breech-bolt and the grip-lever to engage with the said cam-guides to lock and unlock the breech, and to engage with said shoulder when the breech-bolt is locked.

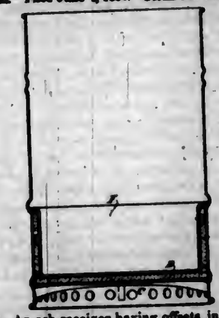
4. In a breech-loading firearm, a grip-lever hinged to the stock or handle of the weapon, a spring to resist the movement of the lever, a breech-bolt connected to said lever, a hammer engaged by the breech-bolt, a spring-actuated sear engaging the heel of the hammer and a lug on the grip-lever, which, in its forward movement disengages the said sear from the hammer.

5. In a breech-loading firearm a firing and automatic firing mechanism, comprising a grip-lever a spring to resist the movement of the grip-lever, a reciprocating breech-bolt, a hammer engaged by the breech-bolt, a sear to engage the heel of the hammer and located in the path of, and disengaged by the grip-lever to fire the weapon, a trigger to engage the hammer, and a lock attached to the frame to engage the trigger and hold it out of engagement with the hammer, whereby the weapon may be discharged by the action of the trigger or grip-lever as desired.

6. In a breech-loading firearm, a grip-lever forming a hand-grasp, a reciprocating breech-bolt, a connecting medium between the grip-lever and the breech-bolt engaging with a movable and an immovable cam-guide, and a cartridge-carrier, all actuated by said grip-lever.

7. In a breech-loading firearm a chamber having a cam-guide beneath the breech-bolt and a breech-locking shoulder, a grip-lever having cam-slots in its upper end, a connecting-bar between the breech-bolt and grip-lever and engaging said cam-guides and said shoulder to lock and unlock the breech, a carrier-lever engaging with said bar and a reciprocating carrier engaging said lever.

8. A stock wall or plate provided with a triangular-shaped cam-groove *a*, a reciprocating cartridge-receiver or semicylindrical shell E attached to a cartridge-carrier a movable bearing 11 against which the shell E springs, the said bearing engaging with the said triangular cam-groove *a* and the cam action of the groove operating to open and close the receiver as and for the purpose set forth.

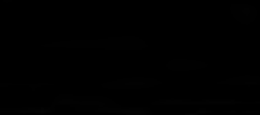


9. A cartridge-receiver or semicylindrical shell E, a cartridge-carrier connected with said shell, movable bearings 11 against which the respective opposite sides of the shell E spring in opening, a stock wall or plate containing a cam-groove *a* with which the said movable bearings 11 engage, a projection or arm 12 which is arranged in the path of the forward movement of a reciprocating breech-bolt, a reciprocating breech-bolt engaging with the said bearings 11.

10. A cartridge-magazine located beneath the barrel and having its rear end hinged to the frame, so that the magazine can be swung out to the side of the frame when it is desired to load the same, the forward end of the magazine having a corresponding hinge which is fastened to an arm which arm is fixedly attached to the barrel.

11. A cartridge-magazine located beneath the barrel and having at its rear end a projection attached to the side of the magazine which projection is hinged to the frame of the weapon, the forward end of the magazine having a corresponding projection which is attached or hinged to a projection or arm which is fixedly attached to the barrel, the said magazine containing a spring-actuated plunger and having a longitudinal slot in which slot sides a pin or spur which is fixedly attached to the plunger and by means of which the plunger can be forced forward.

12. The combination with the barrel and stock of a breech-loading firearm of a magazine beneath the barrel and eccentrically and pivotally supported.



601,845. SAFETY ASH-RECEIVER. SIDNEY M. SMITH, San Francisco, Cal. Filed June 4, 1897. Serial No. 639,462. (No model.)

Claim.—1. An ash-receiver having offsets in its sides, a bottom for the receiver, arched upward to resist strain and having its edge expanded into one of said offsets, a second bottom of smaller diameter than the interior of the receiver and having its edge turned upward parallel with the sides of the receiver and expanded into the other offset, and a filling of non-heat-conducting material in the spaces between the bottoms and between the upturned edge of one bottom and the inner wall of the receiver.

2. An ash-receiver consisting of an exterior containing vessel, channels formed intermediate between the top and bottom edges, a bottom arched and having its edges expanded and locked into the lower channel, a second bottom of smaller diameter than the interior of the receiver with sides extending upwardly and the upper edge expanded and locked into the uppermost of the grooves or channels of the receiver, and a filling of non-conducting material continuous between the double bottoms and the double sides.

601,846. SPINDLE AND BEARING. WALLACE I. STIMPSON, Milford, Mass., assignor to the Sawyer Spindle Company, Boston, Mass. Filed Oct. 24, 1896. Renewed Nov. 13, 1897. Serial No. 658,437. (No model.)

Claim.—1. A bolster-case, a bolster held from rotation therein and having a tapering bore, a spindle having a tapering pintle to enter said bore, a step adjustably connected with the bolster by a screw-thread, and a spring locking-finger on the step adapted to engage the bolster and prevent rotation of the step relatively thereto, said finger having its free end bent out to facilitate unlocking, substantially as described.

2. A bolster-case, a bolster held from rotation therein and having a series of longitudinal notches at its lower end, a spindle to enter the bolster with a tapering fit, a step adjustably connected with the bolster by a screw-thread, and a yielding locking-finger secured to the step and adapted to enter one of the notches in the bolster, substantially as described.

3. A bolster-case, a spindle bolster held from rotation therein, a step adjustably connected thereto, and a locking-finger carried by one to enter a notch in the other and thereby prevent relative rotation of the bolster and step, substantially as described.

601,847. CAR-COUPLING. CLINTON A. TOWER, Cleveland, Ohio, assignor to the National Malleable Castings Company, same place. Filed Nov. 29, 1897. Serial No. 660,033. (No model.)

Claim.—1. A coupler having a knuckle, a movable lock, a floating lock-set unattached to the lock and having a portion extending into the path of its motion so as to be engaged, raised and moved laterally thereby into supporting position: substantially as described.

2. A coupler having a knuckle, an upwardly-movable lock, a floating lock-set unattached to the lock and having a portion extending into the path of its motion so as to be engaged and raised thereby, and having a bearing at the draw-head whereby it may be moved into the supporting engagement with the tail of the knuckle; substantially as described.

3. A coupler having a knuckle, an upwardly-moving lock, a floating stilt-like lock-set unattached to the lock, but having a lock-supporting step, and an arm extending into the path of the lock's motion and adapted to be successively engaged, raised and moved laterally thereby into supporting position on the knuckle's tail; substantially as described.

4. A coupler having a knuckle, a movable lock, and a stilt-like lock-set consisting of an upright bar having projecting portions between which the lock operates to move the lock-set; substantially as described.

5. A coupler having a knuckle, a locking and knuckle-opening piece movable to open the knuckle, and a lock-set adapted to be raised into supporting position by the locking and opening piece when the motion of the latter is restrained by the interlocking of a companion knuckle and to be supported by the locking and opening piece when the latter is moved to the limit of its motion in opening the knuckle; substantially as described.

6. A coupler-knuckle having on the upper surface of its tail a basin or groove adapted to support and retain the foot of a lock-set, said basin or groove having a retaining-rim on the side next to the end of the tail; substantially as described.

7. A coupler-knuckle having on the surface of the end portion of its tail a basin or groove leading toward the margin of the knuckle and adapted to support and retain the foot of a lock-set, and a lock-set or stilt whose foot is adapted to fit in said groove and which extends upwardly through the draw-bar; substantially as described.

8. A stilt-shaped lock-set having a lock-supporting step portion, and a lifting-arm, said parts providing an intermediate space adapted to receive a lock by which the lock-set is operated; substantially as described.

9. A stilt-shaped lock-set having a lock-supporting step portion, and a lifting-arm, said parts providing an intermediate space adapted to receive a lock by which the lock-set is operated, said lock-set extending through the draw-head to the exterior thereof; substantially as described.

601,848. BOTTLE. WILLIAM WILSON, Oakland, Cal. Filed Oct. 22, 1897. Serial No. 656,010. (No model.)

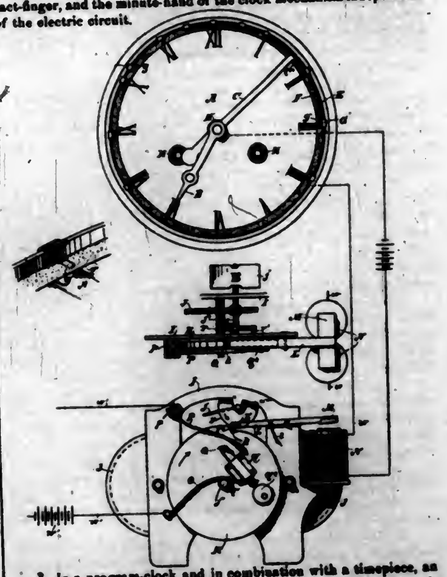
Claim.—1. The combination with a bottle, of an extension fixed to and essentially in line with the bottle-neck, a spirally-grooved carrier having a stopper fixed to its inner end, means for rotating the carrier to withdraw the stopper or close it against the neck of the bottle, a chamber in the upper part of the extension, an opening made

in the extension communicating with the chamber, said chamber having a discharge-passage at one side through which liquid may flow when the bottle is tilted for the purpose, and an automatically-acting inwardly-closing valve between the chamber and interior of the extension whereby liquid is prevented from entering the bottle from the discharge-passage.

2. The combination of a bottle with an extension fixed to and essentially in line with the neck, a spirally-grooved carrier fitting and movable with relation to the extension, having a stopper upon its inner end by which the neck is opened or closed, a chamber in the upper part of the extension and communicating therewith through a discharge-passage opening from the extension, an automatic inwardly-closing valve or diaphragm controlling said opening whereby liquid is prevented from entering through the discharge-passage, a second passage for the inlet of air to replace the discharged liquid, said passage having a valve or diaphragm fixed within it which will allow the ingress of air to replace the discharged liquid but it will arrest the passage inwardly of any liquid.

601,849. PORTABLE POLE-STEP. GEORGE D. AIKEN, Salt Lake City, Utah. Filed June 12, 1897. Serial No. 640,556. (No model.)

Claim.—1. A holder for pole-steps and the like comprising a spike having a head provided with an opening therethrough, and a plate at the inner end of said head extending in the direction of the opening, whereby a shank upon a pole-step can be inserted through the opening and rest against the plate; substantially as described.



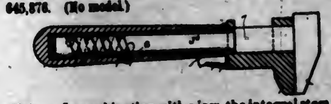
2. A holder for pole-steps and the like comprising a vertical plate, a head upon said plate below its upper edge and extending at an angle to the plate, said head being provided with an opening for receiving a suitable portion of the step, an inclined wall between the vertical plate and the outer end of the head, and means for securing the holder to a pole or other member; substantially as described.

3. A holder for pole-steps and the like comprising a spike having a head provided with a vertical socket, a vertical plate to bear on the pole, forwardly-projecting legs on the plate below the head and inclined flanges connecting the plate and head at opposite sides of the socket; substantially as described.

601,850. PROGRAM-CLOCK. ELVIN F. BURRILL, Oakland, Cal. Filed Sept. 4, 1896. Serial No. 604,837. (No model.)

Claim.—1. In a program-clock, the combination of a dial having an annular flange or circle, a node consisting of a substantially U-shaped plate having resilient side arms or members adapted to straddle said flange or circle and to be adjusted to different points thereon, a finger projecting transversely and directly from the lower extremity of one of the legs of the node and being of a substantially right-angled-triangular shape in cross-section, an electrically-operated clock-hand having an underbent lever on its outer end, adapted to extend in the direction of the movement of the hand and to travel up the slope of the finger and an insulating-strip on the under side of the lever and covering the major portion and exposing the point thereof whereby the lever travels up the slope and makes contact with the ridge or edge of the finger.

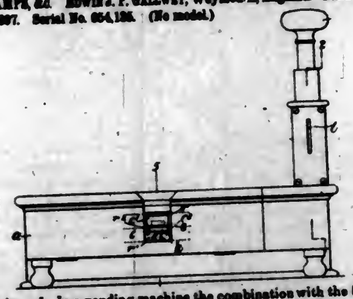
2. In a program clock, the combination of a dial having an annular flange or circle, set on edge, a substantially U-shaped plate or node having its side legs or members to embrace and frictionally engage said flange or circle, one of said legs having rigid with and projecting directly from its lower extremity a contact-finger triangular in cross-section, an electrically-connected hour-hand of a clock mechanism, a ring of insulating material fitted to the dial at one side of the circle or flange, and upon which the broad flat base of the finger lies, an underbent lever carried by the hand and having on its under surface an insulating-strip which exposes only the extremity of the lever to electrical contact with the upper edge or ridge of the contact-finger, and the minute-hand of the clock mechanism independent of the electric circuit.



3. In a program-clock and in combination with a timepiece, an electric circuit and connections by which a hand of the timepiece is adapted to close said circuit at prescribed times, an intermediate device set in operation by the closing of said circuit and adapted to actuate the ultimate mechanism for rendering the program, said device consisting of a power mechanism, a cam rotated thereby, a lever for releasing and stopping said cam, an electromagnet and armature operated by the timepiece-circuit to actuate the lever, a fixed electrical contact-piece, and a contact-finger carried by the cam and adapted to make and break electrical contact with said piece.

4. In a program-clock and in combination with a timepiece, an electric circuit and connections by which a hand of the timepiece is adapted to close said circuit at prescribed times, an intermediate device set in operation by the closing of said circuit and adapted to actuate the ultimate mechanism for rendering the program, said device consisting of a power mechanism, a cam rotated thereby, a lever and means controlled thereby and operating through the fly or fan regulating device of the power mechanism for releasing and stopping said cam, an electromagnet and armature operated by the timepiece-circuit to actuate the lever, a fixed electrical contact-piece, and a contact-finger carried by the cam and adapted to make and break electrical contact with said piece.

5. In a program-clock, and in combination with a timepiece, an electric circuit and connections by which a hand of the timepiece is adapted to close said circuit at prescribed times, an intermediate device set in operation by the closing of said circuit and adapted to actuate the ultimate mechanism for rendering the program, said device consisting of a power mechanism, a cam rotated thereby, a lever for releasing and stopping said cam, an electromagnet and armature operated by the timepiece-circuit to actuate the lever, a fixed electrical contact-piece and a contact-finger carried by the cam and adapted to make and break electrical contact with said piece, said finger being adjustable to increase or diminish the length of its contact.

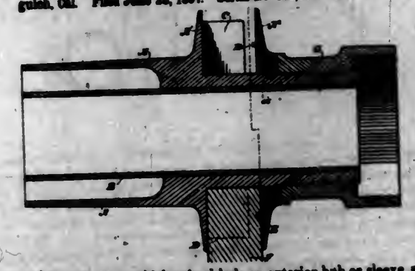


601,851. WRENCH. ALFRED B. FRACK, Girard, Ohio, assignor to Henry C. Marshall, same place. Filed July 26, 1897. Serial No. 645,876. (No model.)

Claim.—In combination with a jaw, the integral stem thereof with a blind helical groove about the said stem, a jaw slidably mounted upon the said stem and having an extended leg with the key and slot

therefor and the circular recess, the hollow handle slidably mounted upon the stem, the annular flange of the said handle engaging the said circular recess, the set-screw threaded into the said handle, the hollow end of the said set-screw, and the ball playing in the said hollow and in the before-mentioned blind helical groove, all substantially as described.

601,852. COIN-FREED APPARATUS FOR DELIVERING STAMPS, &c. EDWIN J. P. GALLWEY, Weymouth, England. Filed Oct. 5, 1897. Serial No. 654,126. (No model.)



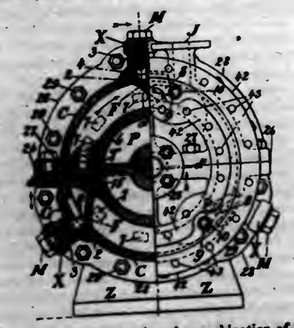
Claim.—1. In a vending-machine the combination with the band provided with a series of transverse pockets, each provided with an indicating device, means for feeding said band, a casing provided with a delivery-aperture in line with the path of said band, a transparent plate closing a portion of said aperture and adapted to lie over the indicating devices of said band, and a plate extending over the adjacent portion of said aperture, said plates having a slit formed between them in line with the path of the band to allow the articles carried by said band to project therethrough, substantially as described.

2. In a vending-machine, the combination with the band provided with a series of transverse pockets of feeding mechanism for said band, a casing provided with a delivery-aperture in the path of said band, a pair of plates extending over portions of said aperture and inclosing said band, said plates having their adjacent edges separated to form a slit in line with the path of the band, to allow the articles carried by the band to project therethrough, substantially as described.

3. In a vending-machine, the combination with the band provided with a series of transverse pockets opening toward one edge of the band, feeding mechanism for said band, a casing provided with a delivery aperture in the path of the band and a spring plate or tongue in said aperture for covering the exposed portion of the band, and provided with an inclined projection adapted to pass between the band and the articles carried thereby, substantially as described.

4. In coin-freed apparatus for delivering stamps and other articles the combination with a casing having a window or orifice, of a band for holding the stamps or other articles, of two rollers upon one of which the band is initially wound and upon the other of which the said band is intermittently wound upon the insertion of coins into the apparatus so as to bring the stamps upon the band successively in front of the window or orifice, and of a spring plate or tongue for covering the exposed portion of the band, and having an inclined projection for tilting forward the stamps or other articles in the window or orifice, substantially as described.

601,853. VEHICLE-WHEEL HUB. GUSTAVE A. KROHN, Goldgulch, Cal. Filed June 26, 1897. Serial No. 642,569. (No model.)



Claim.—1. In a vehicle-wheel hub, an exterior hub or sleeve, an interior box or journal to receive the spindle upon which the wheel turns, a fixed circular flange projecting outwardly from the hub having the inner face in a plane transverse to the axis, and the opposite end of the hub or sleeve being made cylindrical and partially screw-threaded, radial plates fixed or formed with the fixed flange, a disk movable upon the cylindrical portion of the hub having an annular flange projecting from its inner plane face, spokes having corresponding grooves formed to receive the annular flange, said spokes being tapered to enter the space between the disks and between the radial plates and each having a recess in one of its pieces and extending only part way across the same, and adapted to entirely receive one of said plates and to leave a face to abut against the face of an adjacent spoke, and a nut adapted to screw upon the outer end of the sleeve or hub whereby the movable disk is compressed firmly upon the spokes after they are in position and the whole locked together.

2. In a vehicle-wheel hub, an exterior sleeve adapted to contain an interior box or axle-journal and having fixed and movable disks, the inner faces of which are in planes transverse to the axis, one of said disks having projecting radial planes and the other an annular rib and spokes correspondingly cut out and grooved to fit said plates and rib, a screw-threaded nut turnable upon the end of the hub whereby the disks are clamped together upon the spokes, and an open channel formed in the end of the hub with radial ribs substantially as described.

3. In a vehicle-hub, a sleeve having an inner box to form an axle bearing or journal, circular fixed and movable flanges between which the spokes are to be clamped, with suitable means for locking said spokes in place, and a screw turnable upon the sleeve to force the movable flange against the spokes, an open annular channel formed within the disk exterior to the axle-box, said channel having annular inwardly-projecting ribs H and a wood filling driven into said channel and locked in place by said ribs.

601,854. ROTARY ENGINE. JOHN H. MEYER, Philadelphia, Pa. Filed Mar. 9, 1897. Serial No. 626,571. (No model.)

Claim.—1. In a rotary engine the combination of a steam-cylinder C, having pivoted on the inner circumference thereof a valve F, with a piston P having a moving fit in the cylinder and provided with a valve-lifting thumb T, the said cylinder C being provided with suitable inlet and exhaust ports for the steam, and the piston P having the side rings 1, 1, provided on one side with the inlet-ports 8, and the curved exhaust-port 6 extending from the front of the thumb to the side thereof next the exhaust side of the cylinder and connecting the interior of the piston with the exhaust-ports 7, substantially as shown.

2. In a rotary engine the combination of a cylinder C, provided with inlet and exhaust ports and having flap-valves F, pivoted thereto, and means for holding said flap-valves in contact with the periphery of the piston, with a piston P having the side rings 1, 1, mounted in said cylinder and having thereon the lifting-thumb T, provided with the curved exhaust-port 6 extending from the front to the side of the thumb next to the exhaust side of the cylinder for the purpose of connecting the interior of said cylinder directly with the exhaust-ports, as set forth.

3. In a rotary engine the combination of two or more steam-cylinders of different volumes mounted upon a single driving-shaft, each of said cylinders having pivoted on the inside thereof a series of flap-valves F, with the pistons P, having thereon the side rings 1, 1, and between said side rings the extending thumbs T, operating the flap-valves, the several cylinders being provided with suitable inlet and exhaust ports and connected with a steam-supply, each piston having in the side ring 1 thereof the inlet-port 8, and in the extending thumbs the curved exhaust-ports 6, forming a connection with the exhaust-ports 7 of the cylinders, substantially as shown and for the purpose described.

4. In a rotary engine the combination of two or more steam-cylinders having therein steam-inlet ports, and increasing in volume from the first cylinder that takes steam to the last one that exhausts, with the receiver R located between each two of the cylinders, and the several series of the flap-valves F, pivoted on the inner circumference of each cylinder, and a series of pistons P, having the side rings 1, 1, and mounted on the same driving-shaft and having moving fit in their respective cylinders, and each of said pistons having thereon a series of valve-lifting thumbs T, provided with the curved exhaust-ports 6, that extend through said thumbs from the front to the side thereof and through the adjacent side ring 1 and register with exhaust-ports in the sides of the cylinder, substantially as shown.

5. In a rotary engine the combination of the series of steam-cylinders C, having between each two of the cylinders, the receivers R, and having on one side of each cylinder, the inlet-ports 9, the first of said inlet-ports being connected with the steam-chest and the others with the several receivers and on the opposite side of said cylinders the exhaust-ports 7, connected with the several receivers and with the outlet on the last cylinder; with the flap-valves F, pivoted to the inner circumference of the cylinders and provided with suitable means for forcing said valves down after they have been raised, and the pistons P, all mounted on the same shaft and having thereon the side rings 1, 1, and inlet-ports 8, registering with inlet-ports 9, in the cylinders and provided with the extending thumbs T, having the exhaust-ports 6, that register with the exhaust-ports 7, in the cylinders as the pistons turn around, all arranged substantially as shown.

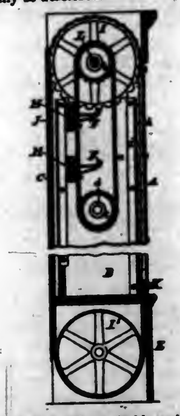
6. In a rotary engine, the combination of a cylinder C, flap-valves F, pivoted on the inside of the cylinder, extensions X, located on the outside of the cylinder and connected with a steam-supply and having therein the steam-piston K, and rod 5, pressing upon the flap-valve, with the piston P, having thereon the thumbs T, and side rings 1, 1, the cylinder and piston P, being each provided with suitable inlet and exhaust ports and connected with a steam-supply, substantially as shown.

7. In a rotary engine, the combination of the cylinder C, having therein the pivoted flap-valve F, and on the outside the closed extensions X, bored out to fit the liners 35, having therein the openings 36 and 37, with the pistons K, operating-rods 5, pressing against the flap-valves F, substantially as shown.

8. The closed top extension X, having on the side thereof an opening that connects with a steam-supply and on the opposite side a similar opening for the exhaust, in combination with the liner 35, fitting into said extension and having therein the two rows of openings 36 and 37, and the small piston K, having therein the openings 40 and the extending rod 5, that presses against the flap-valves, substantially as shown and for the purpose described.

9. In a rotary engine, the cylinder C, a steam-inlet port provided with a bushing movably secured in the cylinder and held in sliding contact with the side of the piston by the pressure of the ingoing steam on the outer surface of the port, substantially as shown.

10. In a rotary engine, the cylinder C, the steam-inlet port 9, provided with a bushing movably secured in the cylinder C, and surrounded by the conical packing-ring 12 and held in sliding contact with the side of the piston P, by the pressure of the ingoing steam, substantially as shown and described.



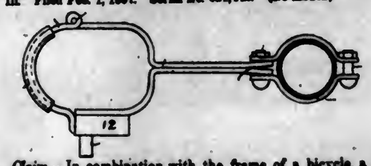
11. In a rotary engine, the cylinder C, the exhaust-port 7, provided with a bushing movably secured in the cylinder C, and held in sliding contact with the side of piston P, by means of the spring 21, substantially as shown and described.

12. A piston for rotary engines composed of the two side rings 1, 1, having a moving fit in the cylinder and inclosing between them a central portion having thereon the extending thumb T, the side rings 1, 1, being provided with inlet and exhaust ports respectively above the said central portion, and the thumb T having therein the curved exhaust-port 6 that extends from the front of the thumb to the outside of the piston passing through the side ring 1 that lies next to the exhaust side of the cylinder, substantially as shown.

13. In a rotary steam-engine the combination of a cylinder C provided with an inlet and exhaust port on opposite ends thereof and having pivoted on the inner circumference a valve F, with a piston P provided with valve-lifting thumb T, having therein the curved exhaust-port 6 extending from the front of the thumb to the side thereof next to the exhaust side of the cylinder; and the two side rings 1, 1, having a moving fit in the cylinder; the forward one of said side rings being provided with a steam-inlet port that registers at intervals with the inlet-port on the front end of the cylinder and the rear one of said side rings having therein an exhaust-port that registers with the curved exhaust-port in the thumb T and communicates with the exhaust-opening in the rear end of the cylinder, as shown.

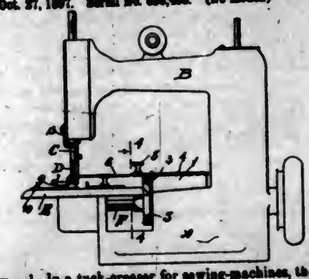
601,855. WARDROBE. SAMUEL P. MOULTHROP, Rochester, N. Y. Filed Sept. 13, 1897. Serial No. 651,530. (No model.)

Claim.—1. The combination with a suitable casing, open at its top and at the front, of the perforated movable flexible screen coextensive with said front and top openings and adapted to be shifted vertically up and down to open and close the front, suitable pulleys revolving on horizontal axes in the upper and lower parts of the casing, the flexible bands connecting the ends of the flexible screen and passing around said pulleys, and means for operating the flexible screen, substantially as described.



2. The combination with a suitable casing open at its top and at the front, of the perforated movable flexible screen adapted to be shifted vertically up and down to open and close the front, suitable pulleys revolving on horizontal axes in the upper and lower parts of the casing, the flexible bands connecting the ends of the flexible screen and passing around said pulleys, means for operating the flexible screen, a floor or partition having openings for the passage of the bands, and a bar K to hold the screen extended laterally and serve as a stop at the floor, substantially as described.

3. The combination with a suitable casing open at its top and at the front, of the perforated movable flexible screen adapted to be shifted vertically up and down to open and close the front, suitable pulleys revolving on horizontal axes in the upper and lower parts of the casing, the flexible bands connecting the ends of the flexible screen and passing around said pulleys, means for operating the flexible screen, a floor or partition having openings for the passage of the bands, a bar K to hold the screen extended laterally and serve as a stop at the floor, guides A, i, and binding *g*, substantially as described.

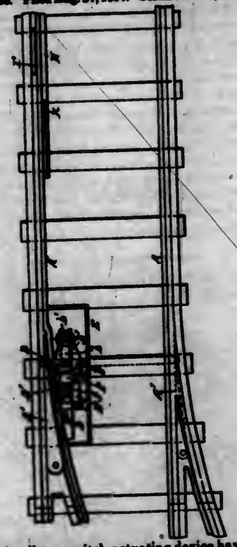


4. In combination, a suitable casing open at its top and at the front, and having a horizontal partition forming a lower compartment, a door for said compartment, a perforated movable flexible screen adapted to be shifted vertically up and down to open and close the front, stops on said screen, suitable pulleys revolving on horizontal axes in the upper part of the casing and in the lower compartment near the ends of said casing, flexible bands connecting the ends of the flexible screen and passing around said pulleys in the lower compartment, and means for operating the flexible screen, substantially as described.

601,856. LOCK FOR BICYCLES. FRED C. MCDONALD, Chicago, Ill. Filed Feb. 1, 1897. Serial No. 621,442. (No model.)

Claim.—In combination with the frame of a bicycle, a clamp consisting of two halves adapted to embrace a portion of said frame and provided with bolts for securing it thereto, an arm consisting of two pieces brazed or riveted together and terminating in a fork adapted to embrace the rim of a wheel of said bicycle, a second and lesser fork on the other end of said arm pivoted to one of the bolts of said clamp and provided with means for giving it a frictional contact with the halves of said clamp, a shackle-arm pivoted to one branch of said first-mentioned fork and having its free end adapted to engage the other branch, and a lock on said other branch for securing the free end of said shackle-arm.

601,857. TUCK-CREASER. WILLIAM H. RIEF, Newark, N. J. Filed Oct. 27, 1897. Serial No. 656,468. (No model.)



Claim.—1. In a tuck-creaser for sewing-machines, the combination of a creaser-gage, a flexible creaser-arm having one end adjustably secured and its other end extending over the creaser-gage, a cam placed in engagement with said creaser-arm for vibrating the same, and a spring having one end in connection with said creaser-arm and its other end attached to a fixed part of the machine for the purpose of preventing whipping of the creaser-arm, substantially as described.

2. In a sewing-machine, the combination with a stitch-forming mechanism, of a flexible plate attached to the bed of the machine, a creaser-arm having an adjustable connection with the plate and having its forward end extending between the needle-bar and presser-bar, a cam mounted on the main shaft of the machine and engaging with said plate, a spring connected with the arm of the machine and with the free end of the creaser arm, a creaser-gage cooperating with the creaser-arm, and a tucker-gage, substantially as described.

3. In a tuck-creaser for sewing-machines, the combination of a flexible plate, a creaser-arm slotted at its rear end, means for connecting said creaser-arm to the plate located near the end of the plate toward the needle-bar, a creaser-gage cooperating with the creaser-arm, and a cam acting on said plate, substantially as described.

601,858. SWITCH-ACTUATING MECHANISM FOR RAILWAYS. WILLIAM H. ROBERTS, Detroit, Mich., assignor of one-half to Samuel Heath, same place. Filed Aug. 27, 1897. Serial No. 649,699. (No model.)

Claim.—1. A railway-switch-actuating device having in combination a switch-point, a reciprocatory dog, mechanism connected with said switch-point actuated by said dog to shift the point, and means located at a distance from the point actuated by a moving car to actuate said dog, substantially as set forth.

2. A railway-switch-actuating device having in combination a switch-point, a reciprocatory and oscillatory dog, and a movable lever connected with the switch-point actuated by the dog, said lever having a fixed fulcrum, for the purpose set forth

3. A railway-switch-actuating device having in combination a switch-point, a reciprocatory and oscillatory dog, an oscillatory lever fulcrumed independently of the point, and means connecting said lever with the switch-bar, said lever engageable by the dog to throw the switch-point in the opposite direction from the position occupied, for the purpose set forth.

4. A railway-switch-actuating mechanism having in combination a horizontally-oscillatory switch-point, a horizontally-oscillatory lever having a fixed fulcrum, a device connecting the switch-point with said lever, a reciprocatory and oscillatory mechanical device to engage said lever to throw the lever and actuate the switch-point, and additional means actuated by a moving car at a point distant from the switch-point to actuate said reciprocatory and oscillatory device, for the purpose set forth.

5. A railway-switch-actuating device having in combination a switch-point, an oscillatory lever connected therewith fulcrumed independently of the switch-point, a reciprocatory slide, and an oscillatory dog carried by said slide to engage said lever, for the purpose set forth.

6. A railway-switch-actuating mechanism having in combination a switch-point, a lever connected therewith fulcrumed independently of the point, and a reciprocatory and oscillatory device to engage said lever to move the switch-point into the opposite position from that occupied, for the purpose set forth.

7. A railway-switch-actuating mechanism having in combination a switch-point, a lever connected therewith, a slide, an oscillatory dog carried by the slide to actuate said lever, said lever provided with vertically-extended shoulders, one of which is engageable by said dog to throw the switch-point into an opposite position from that occupied, for the purpose set forth.

8. A railway-switch-actuating mechanism having in combination a switch-point, a reciprocatory slide, a laterally-oscillatory dog carried by said slide, means to retract said dog into normal position when the slide is retracted, and a device connected with the switch-point actuated by said dog to throw the switch-point into opposite position from that occupied, for the purpose set forth.

9. A railway-switch-actuating mechanism having in combination a switch point, an oscillatory lever connected therewith, a reciprocatory slide, ways in which said slide reciprocates, and an oscillatory dog carried by said slide engageable with said lever to throw the switch-point into opposite position from that occupied, said ways adjacent to the dog constructed to guide the dog into normal position when the slide is retracted, for the purpose set forth.

10. A railway-switch-actuating mechanism having in combination a switch-point, a lever connected therewith fulcrumed independently of the point, a reciprocatory slide, an oscillatory dog carried by the slide to engage said lever, an operating-rod connected with said slide to force the slide toward the lever, and means to retract the slide, for the purpose set forth.

11. In a switch-actuating mechanism, the combination with a switch-point, of a lever connected therewith, a reciprocatory slide provided with means to engage said lever and throw the switch-point into the opposite position from that occupied, a rod connected with said slide, and a lever connected with the opposite end of said rod, said lever engageable by a device carried by a car, for the purpose set forth.

12. A railway-switch-actuating device having in combination a switch-point, a lever connected therewith fulcrumed independently of said point, mechanism to shift the position of said lever to actuate the point, a rod connected with said mechanism, a lever connected with said rod, a lever provided with a shoulder engageable by a car-wheel to throw the first-named lever into position, and means carried by a car to engage the first-named lever, for the purpose set forth.

13. A railway-switch-actuating mechanism having in combination a switch point, a lever having a fixed fulcrum, mechanism to throw the lever into position opposite to that occupied to actuate the point, a rod G, and levers I, J and K arranged, substantially as and in the manner set forth.

14. A railway-switch-actuating mechanism having in combination a switch-point, a lever having a fixed fulcrum independent of the point, of mechanism connected therewith to throw the point into position opposite to that occupied, an operating-rod connected with said mechanism, and means engageable by a car to actuate said rod, substantially as set forth.

15. A railway-switch-actuating device having in combination a switch-point, a reciprocatory and laterally-oscillatory dog, and means connected with the switch-point actuated by said dog to shift the point, substantially as set forth.

16. A railway-switch-actuating device having in combination a switch point, a reciprocatory and oscillatory dog, fixed guides or ways in which said dog reciprocates, and means connected with the switch-point actuated by said dog to shift the point, substantially as set forth.

17. A railway-switch-actuating device having in combination a

switch-point, a reciprocatory dog, and a lever connected with the switch-bar actuated by the dog, said lever fulcrumed at one end and swinging at the end adjacent to the dog in the arc of a circle, substantially as set forth.

18. A railway-switch-actuating device having in combination a switch-point, a reciprocatory and oscillatory dog, fixed guides or ways in which said dog reciprocates, and means connected with the switch-point actuated by the dog to shift the point, said fixed guides or ways directing the dog in its reciprocation, and oscillating the dog back into normal position when retracted, substantially as set forth.

19. In a railway-switch-actuating device, the combination of a switch-point, a reciprocatory dog, a lever connected with the switch-bar actuated by the dog, said dog when the switch-point is intermediate the adjacent rails capable of reciprocation without actuating said lever, substantially as set forth.

601,859. BLUE AZO DYE. CHRISTIAN RUDOLPH, Offenbach-on-the-Main, Germany, assignor to The Firm of K. Oehler, same place. Filed Jan. 4, 1893. Serial No. 457,290. (Specimens.)

Claim.—1. The method of producing a new blue tetrazo dyestuff consisting in combining tetrazo diphenyl or ditolyl first with one molecule of amidoöxy-alpha-naphthalene-disulfo-acid in an alkaline solution and then with one molecule of dioxynaphthalene 2.6 dissolved in alkali.

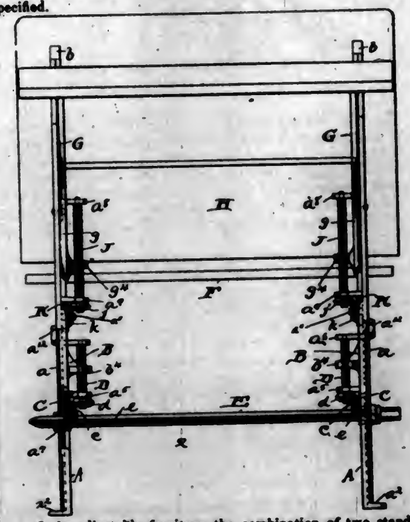
2. As a new article of manufacture the blue dyestuff herein described which is a black-violet powder with a metallic luster, soluble in water with a blue-violet and in sulfuric acid with a greenish-blue color; muriatic acid changing the color of its watery solution into red-violet and soda-lye into blue; zinc-dust decoloring its alkaline solutions, substantially as set forth.

601,860. CLIP FOR DROP-LIGHT WIRES. CHARLES SCHUETZ, Newark, N. J. Filed Dec. 1, 1896. Serial No. 614,046. (No model.)

Claim.—1. A clip for adjusting the height of electric lamps, consisting of two recessed substantially U-shaped links adapted for the passage of the wires, a central link having cam-shaped ends projecting into the recesses of said outer links, and removable pins passing through the outer links and central link and hinging the former to the latter at different points, so as to permit said outer links to swing in line with the longitudinal axis of the central link, substantially as described.

2. A clip for adjusting the height of electric lamps, consisting of two recessed, substantially U-shaped links adapted for the passage of the wires, a central link having its ends projecting into the recesses of said outer links, and removable pins passing through the outer links and central link and hinging the former to the latter at different points, so as to permit said outer links to swing in line with the longitudinal axis of the central link, substantially as described.

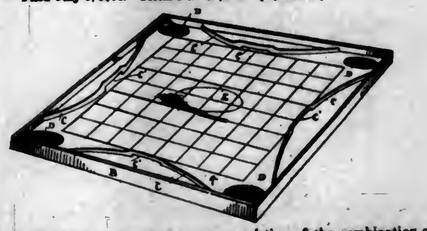
601,861. PRESSER-FOOT FOR SEWING-MACHINES. GEORGE W. STEVENSON, Cramer's Hill, N. J., assignor of one-half to Theodore Loss, same place. Filed Oct. 8, 1897. Serial No. 654,506. (No model.)



Claim.—1. In a presser-foot for a shoe-sewing machine, a pin or stud secured thereto and projecting downwardly, and a roller mounted thereon, adapted to revolve in a plane parallel to the edge of the work and adapted to contact therewith, so as to act as a guide for the latter.

2. In a presser-foot for a shoe-sewing machine, a pin or screw projecting from the bottom thereof, a roller mounted thereon adapted to contact with the edge of the work and a lug or ear on said foot adapted to enter a groove in said work and assist in guiding the same.

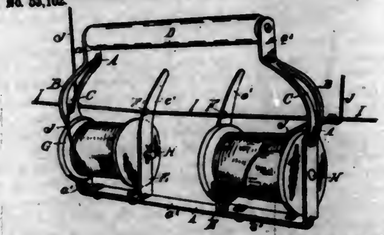
601,862. ADJUSTABLE FURNITURE. WILHELM WICKE, Cleveland, Ohio, assignor to the Cleveland School Furniture Company, same place. Filed July 27, 1896. Serial No. 600,666. (No model.)



Claim.—1. In adjustable furniture, the combination of two standards having each a hole for the reception of an operating-shaft, an operating-screw journaled on the inner side of each standard, a bevel-gear secured to each of said screws, and a rigidly-connected pinion and beveled gear mounted upon the inner side of each standard adjacent to said holes therein, with the movable members which slide upon said standards, an arm rigid with each of said members with which said screws engage, and an operating-shaft adapted to be removably mounted in said holes and having pinions which engage with the pinions hereinbefore named, substantially as and for the purpose specified.

2. In adjustable furniture, the combination of two standards, each having on its inner side two ears a^{9} a^{9}, a rigidly-connected pinion and beveled gear mounted on the inner side of each standard, said standards having each a hole for the reception of an operating-shaft, with two desk-supports which slide respectively against the inner sides of said standards, and have each a slot through which the ear a^{9} projects, an inwardly-projecting arm, and a screw engaging with said arm, and mounted in the two ears a^{9} a^{9}, and a bevel-gear secured to said screw, substantially as and for the purpose specified.

3. In adjustable furniture, the combination of two standards, each having on its inner side two ears a^{9} a^{9}, and a vertical groove a^{10}, and an operating screw mounted in said ears, with two desk-supports each having a vertical slot through which the ear a^{9} projects, and a rib g^{2} which projects into the vertical groove a^{10}, arms on said supports with which said screws engage, and mechanism for turning said screws, simultaneously, substantially as and for the purpose specified.

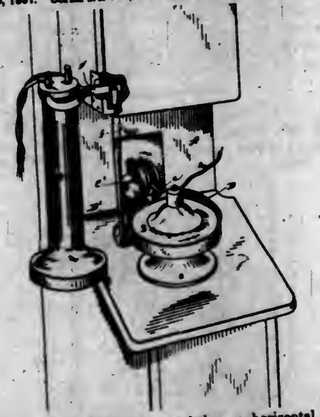


601,863. GAME APPARATUS. EDGAR L. WILLIAMS, Peoria, Ill. Filed July 9, 1896. Serial No. 598,521. (No model.)

Claim.—1. A game apparatus consisting of the combination of a board A bounded by the sides B, curved arch-piece C secured to each of the sides B and the said board A, to form inclosures, the openings C in the said arch-pieces, in the middle of the length thereof, a pocket or recess D cut into the surface of the board in each angle thereof and located between the adjacent ends of the arches C, and the center playing-circle E, all arranged substantially as herein described and shown.

2. A game apparatus consisting of the combination of a board A, bounded by the sides B, curved arch-pieces C secured to each of the sides B and the said board A to form inclosures, the openings C in the said arch-pieces in the middle of the length thereof, a pocket or recess D cut into the surface of the board in each angle thereof and located between the adjacent ends of the arches C, the center playing-circle E and a square upon the board to indicate the playing position all arranged substantially as herein described and shown.

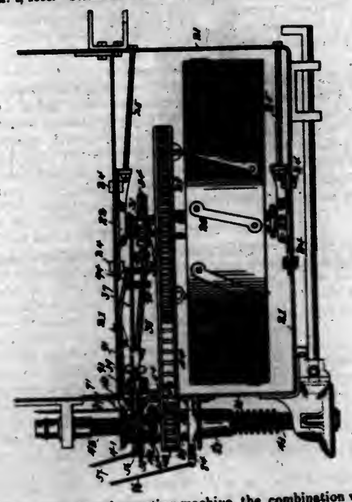
601,864. DEVICE FOR APPLYING STAY-WIRES TO WIRE FENCES. HENRY WITNEY, Hastings, Mich. Filed Aug. 16, 1897. Serial No. 648,412. (No model.) Patented in Canada Aug. 4, 1898, No. 53,102.



Claim.—1. A frame A, formed with a swell or projection B and with an opening C, and a handle D, in combination with the spool G, and means for supporting the latter, and standards E, E, formed with the beveled or inclined ends e' and with a notch or recess F, substantially as and for the purpose set forth.

2. A frame A, formed in three sections a', a^{2}, and a^{3}, and the sections a' and a^{2} each formed with the swell or projection B and with an opening C, and a handle D, in combination with the spools G G, and means for supporting the latter, and the standards E E, formed with the beveled or inclined end e' and with a notch or recess F, substantially as and for the purpose set forth.

3. In a tool for weaving stay-wires, the combination of an inclosing frame comprising two outwardly-curving side bars formed with openings, a handle-bar between the side bars at one end, and an end bar connecting the opposite ends, curved standards mounted upon said end bar and provided with notches for the line-wires, and wire-carrying spools mounted between the side bars and the adjacent standards.



601,865. TELEPHONE. THOMAS F. ABNER, Detroit, Mich. Filed Apr. 26, 1897. Serial No. 633,917. (No model.)

Claim.—1. A transmitter suspended on a horizontal axis in a plane in or parallel to the diaphragm, so journaled that the speaking-tube is normally downward, and means connecting the movable receiver-hook with the transmitter, compelling the latter to rotate so that the diaphragm is in substantially a perpendicular plane when the receiver is detached from the hook, substantially as and for the purpose described.

2. In a rotating transmitter, the combination of a spring-hook, a receiver, a link connecting the hook to a crank on a rotating transmitter and a transmitter hung on a horizontal axis in a plane in or parallel to the diaphragm, substantially as described.

601,866. HARVESTER. JOHN F. APPLEBY, Chicago, Ill., assignor, by mesne assignments, to David Kelly, same place. Filed Mar. 4, 1895. Serial No. 540,439. (No model.)

Claim.—1. In a harvesting-machine, the combination with the ground-wheel and its axle loosely mounted therein and provided with gears affixed thereto, a main frame, racks rigidly secured therewith and enmeshed with the gears on the axle, a shaft having a sprocket-gear constantly driven from the main ground-wheel, two rigidly-connected pinions slidably mounted on said shaft, one of said pinions having an annular hub provided with cam-slots, said sprocket-gear having pins engaged in said cam-slots, a worm-shaft having a bevel-pinion arranged between said sliding pinions and a spring connecting one of said pinions and the sprocket-gear of the main shaft and normally tending to hold said pinions out of engagement with the bevel-pinion and worm-shaft, substantially as described.

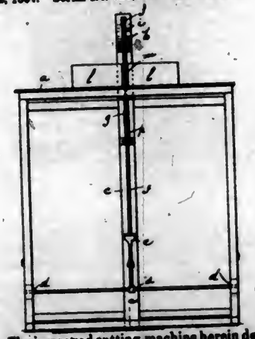
2. In a harvesting-machine, the combination with the ground-wheel and its axle loosely mounted therein and provided with gears affixed thereto, a main frame, racks rigidly secured therewith and enmeshed with the gears on the axle, a shaft having a sprocket-gear constantly driven from the main ground-wheel, two rigidly-connected pinions slidably mounted on said shaft, one of said pinions having an annular hub provided with cam-slots, a worm-shaft having a bevel-pinion arranged between said sliding pinions and a spring connecting one of said pinions and the sprocket-gear of the main shaft and normally tending to hold said pinions out of engagement with the bevel-pinion and worm-shaft, substantially as described.

3. The combination with gearing for vertically raising and lowering the frame and platform of a harvesting-machine, of a gear-shifting mechanism, a bracket projecting rearwardly from the frame of the machine and having a tubular standard, a pipe-section extending therethrough and having cranks on the ends thereof, a connection between one of said cranks and a shifting lever, a foot-treadle beneath the driver's platform and a connection between the other of said cranks and the treadle, substantially as described.

4. In a harvesting-machine, the combination with gearing for driving the cutting and binding mechanism and gearing for raising and lowering the main frame and platform, of a bracket extending rearwardly from the main frame, a frame member extending rearwardly over said bracket and having a driver's seat mounted thereon, a tubular standard rising from the bracket and to which the frame member is connected and gear-shifting mechanism, the controlling members whereof comprise a tube and a rod mounted to rock within the hollow of the standard, the rod passing through the tube and both having connections whereby they may be rocked by the driver from his seat, substantially as described.

601,867. CAR-AXLE LUBRICATOR. STEWART AMSDEN, Walkerville, Canada. Filed Apr. 8, 1897. Serial No. 631,944. (No model.)

Claim.—1. In a lubricator for car-axle journals, in combination with a spring-supporting frame, a pad having downturned side flaps, and the adjacent downturned middle flaps, a surface extending en-



tirely across the box under the journal and a downturned end flap extending across the box as described.

2. In a car-axle journal, in combination with a supporting spring-frame, a pad provided with downturned side flaps, the downturned middle flaps and the downturned end flaps, substantially as described.

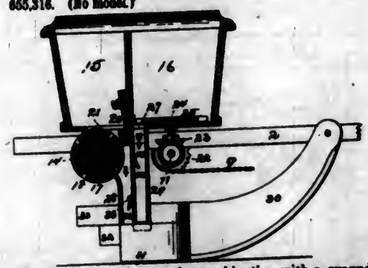
3. In a car-axle lubricator, in combination with a spring-supporting frame, a pad adapted to engage under the journal, and to extend across the box from side to side thereof, provided with downturned side and middle flaps, and an end flap extending across the box and hanging vertically, substantially as described.

601,868. CUTTING-MACHINE. DAVID BROOKS, Verona, N. J. Filed Mar. 22, 1897. Serial No. 628,649. (No model.)

Claim.—1. The improved cutting-machine herein described, comprising a bench or table having cutting-blocks affixed to the upper surface thereof and projecting upward, a cutting-blade working in an open slot in the top of said table, and having an up-and-down movement and a movement to and from said blocks, said cutting-blade when in normal position forming with the blocks, the sides of a trough-like aperture into which the bunch of fibers to be cut can be dropped from above, and long and short levers at the opposite ends of said cutting-blade and means for operating said levers, substantially as set forth.

2. The combination with the bench or table, of the pedal *e*, connecting-rod *f*, long and short levers, *j*, *g*, a cutting-blade connecting said levers, cutter-blocks *l*, *l*, a spring and a connecting-rod *o*, attached to one of the said levers and the spring, all arranged and combined, substantially as set forth.

601,869. IDENTIFYING DEVICE. GEORGE W. BUSH, Detroit, Mich. Filed July 8, 1897. Serial No. 643,818. (No model.)



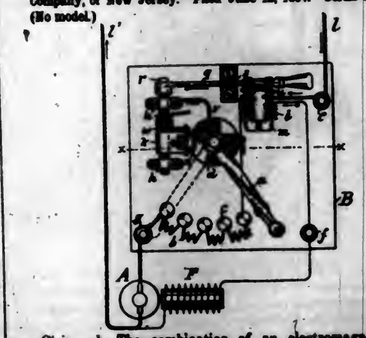
Claim.—1. In an identification-tablet, the combination of an indestructible outer casing provided with a cover removably secured thereto and a tablet composed of asbestos paper secured within said casing between a back of sheet metal and a covering of mica.

2. In an identification-tablet, the combination of the outer casing A provided with an open slot E, a lug F, the cover B secured therein, the apertured ears C C on the casing and cover and a tablet composed of the metal backing A formed with lugs I the asbestos sheet J and sheet of mica K, the parts being arranged substantially as shown and described.

3. In an identification-tablet, the combination of an outer casing provided with a slotted wall, a lug, and an apertured ear, a tablet within said casing, and a cover therefor provided with an apertured ear and adapted to be held in the casing by the said lug and a retaining-shoulder on said slotted wall with said apertures in alinement, substantially as described.

4. In an identification-tablet, the combination of a casing, a tablet therein comprising the metal backing provided with holding-lugs, the asbestos sheet, and the mica sheet held on said backing by said lugs, and a cover secured in said casing, substantially as described.

601,870. PLANTER. GEORGE B. DAVISON, Utica, N. Y., assignor to the Eureka Mower Co., same place. Filed Oct. 15, 1897. Serial No. 655,316. (No model.)



Claim.—1. In a planter, the combination with a ground-opener comprising a body and wings thereon of varying outward projection, arranged in pairs, and tiers in different planes, of a fertiliser-hopper and a chute leading therefrom toward the path of the body of said opener, and a deflector in the bottom of said chute whereby the fertiliser is deflected into the paths of the upper tier of wings of said opener.

2. In a planter the combination with a seedbox and a fertiliser-hopper, and a ground-opener comprising a body and diverging wings of varying projection arranged in tiers one above another, of a seed-chute leading from the seedbox to the path of the lowermost tier of said wings, and a fertiliser chute leading from the fertiliser-hopper to said opener, and a deflector in said chute whereby the fertiliser is spread into the paths of the upper tier or tiers of said wings.

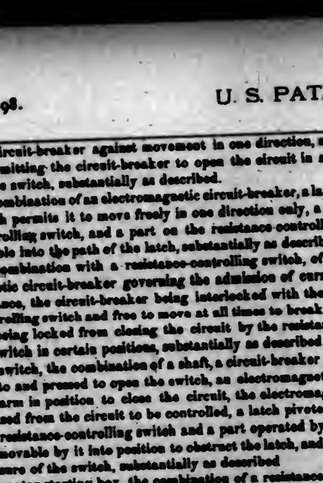
3. In a planter, a seedbox, a fertiliser-hopper, a power-driven shaft, a feed-distributing cylinder mounted thereon, and discharge-chute from said box and hopper combined with separate valves normally closing said chutes, a disk upon said shaft, provided with pins at spaced intervals, a pawl intermittently engaged by said pins and connected to both of said valves, whereby both are simultaneously opened each time one of said pins engages with said pawl, which is provided with a beveled tooth whereby said pawl is raised to open said valves by the engagement of each tooth therewith, and which locks said disk against backward rotation.

601,871. ELECTROMAGNETIC CIRCUIT-BREAKER. GANO S. DUNN, East Orange, N. J., assignor to the Crocker-Wheeler Electric Company, of New Jersey. Filed June 12, 1897. Serial No. 640,411. (No model.)

Claim.—1. The combination of an electromagnetic circuit-breaker, a resistance-controlling switch, means controlled by the resistance-controlling switch for locking the circuit-breaker against closure in certain positions of the switch, and means for permitting the opening of the circuit-breaker in all positions of the switch, substantially as described.

2. The combination of an electromagnetic circuit-breaker, a resistance-controlling switch, a part moved by the switch into position to lock the circuit-breaker against movement in one direction, and means for permitting the circuit-breaker to open the circuit in any position of the switch, substantially as described.

3. The combination of an electromagnetic circuit-breaker, a latch thereon which permits it to move freely in one direction only, a resistance-controlling switch, and a part on the resistance-controlling switch movable into the path of the latch, substantially as described.



4. The combination with a resistance-controlling switch, of an electromagnetic circuit-breaker governing the admission of current to the resistance, the circuit-breaker being interlocked with the resistance-controlling switch and free to move at all times to break the circuit, but being locked from closing the circuit by the resistance-controlling switch in certain positions, substantially as described.

5. In a switch, the combination of a shaft, a circuit-breaker arm keyed thereto and pressed to open the switch, an electromagnet for holding the arm in position to close the circuit, the electromagnet being energized from the circuit to be controlled, a latch pivoted on the shaft, a resistance-controlling switch and a part operated by the switch and movable by it into position to obstruct the latch, and prevent the closure of the switch, substantially as described

6. In a motor-starting box, the combination of a resistance-controlling switch and resistances, a circuit-breaker arm for breaking and completing the circuit in which the resistances are included, a finger upon said arm free to move in one direction only, an electromagnet for holding the arm in position to complete the circuit, a shunt-wound motor having its field-coils and armature in series with the contacts made by the circuit-breaker arm and switch-arm, the coils of the electromagnet being also in series with the circuit-breaker arm and switch-arm and in shunt with the armature of the motor, substantially as described.

7. In a motor-starting box, the combination of resistances, a switch governing the flow of current therethrough, a circuit-breaker arm for breaking and completing the circuit in which the resistances are included, a latch upon the circuit-breaking arm free to move in one direction only, an electromagnet provided with oppositely-wound coils, and holding the circuit-breaker in position to complete the circuit, a shunt-wound motor whose armature and field-coils are in series with the contacts of the switch and circuit breaker arm, one of the windings upon the magnet being in shunt with the armature of the motor, and the other winding upon the magnet being in series with the armature of the motor, substantially as described.

601,872. WAGON-BRAKE. WILLIAM FRASER, Dobbs Ferry, N. Y. Filed Nov. 2, 1897. Serial No. 657,189. (No model.)

Claim.—1. In a chock or lock brake, the combination of a vehicle-axle, a bracket or standard rigidly mounted upon said axle and extending upwardly therefrom, a brake-lever journaled upon said bracket or standard and carrying a brake shoe, and suitable hand-controlled operating means adapted to throw the brake-lever forward or backward and lock the brake-shoe against the wheel in either position to prevent rotation either backward or forward, as set forth.

2. The combination, in a lock-brake, of a vehicle-axle, a bracket or standard rigidly mounted upon the axle, a brake-lever journaled upon said bracket or standard and carrying a brake-shoe, said brake-lever being constructed and arranged to move the brake-shoe into two braking positions from a normal central inoperative position, and suitable operating means connected with the brake-lever and adapted to throw the brake-lever to one side or the other of the central inoperative position and lock the brake-shoe against the wheel in either of the braking positions to prevent rotation either backward or forward, as set forth.

3. The combination, in a brake, of the vehicle-axle, a bracket or standard rigidly mounted upon the axle, a brake-lever journaled upon the bracket or standard and adapted to move the brake-shoe into two braking positions from a normal central inoperative position, a brake shoe or block carried by the brake-lever in position to engage the rim of the wheel, and suitable operating mechanism constructed to hold the braking-lever normally in central inoperative position and throw said lever forward or backward and lock the brake-shoe against the wheel in either of the braking positions to prevent rotation either backward or forward, substantially as set forth.

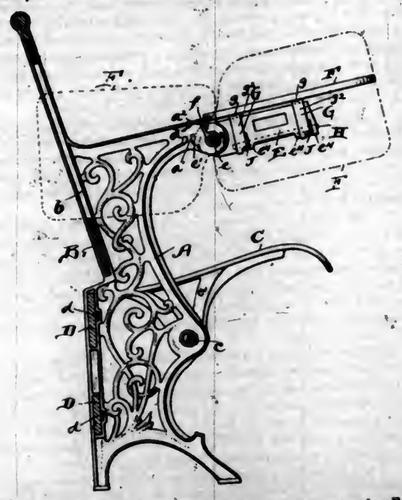
4. In a chock or lock brake, the combination of a vehicle-axle, a bracket or standard rigidly mounted upon the axle, a brake-lever journaled at a point between its ends upon the bracket or standard, a brake-shoe mounted upon the brake-lever upon one side of its journal, and operating mechanism engaging said brake-lever upon the opposite side of its journal, substantially as set forth.

5. The combination, in a chock or lock brake, of a vehicle-axle, a bracket or standard rigidly mounted upon the axle, a brake-lever journaled at a point between its ends upon said bracket or standard, a brake-block mounted upon one end of the brake-lever, an operating rock-lever journaled upon the bracket or standard and engaging the brake-lever at or adjacent to the end farthest away from the brake-block, and a hand operating device controlling said operating rock-lever, as set forth.

6. The combination in a chock or lock brake, of the vehicle-axle, a bracket or standard secured to the axle, a brake-lever carrying a brake-shoe at one end and formed with an elongated slot at the other end, a rock-shaft journaled in the bracket or standard, a rock-arm keyed to one end of said rock-shaft and engaging the slot in the brake-lever, a rock-arm keyed to the other end of said rock-shaft and operatively connected with a hand-lever, as set forth.

7. In a brake, the combination of an axle, a bracket or standard mounted upon the axle, a spring secured to the axle by suitable clips, a brace-plate attached to the bracket or standard and secured to the axle by the clips, a brake-lever journaled upon the bracket or standard, and suitable operating means, as set forth.

601,873. METALLIC PARTITION. GODFREY FOSMAR, Cleveland, Ohio. Filed June 9, 1897. Serial No. 639,971. (No model.)



Claim.—1. A metallic partition comprising a sheet of metal bent sinuously to form the folds *a* which lie in parallel planes, and the connecting ends *a'*, said partition having a plurality of integral tongues punched from said ends and bent around into positions at right angles substantially to the folds and remaining attached in the lines where the folds and ends join, substantially as specified.

2. A metallic partition comprising a sheet of metal bent sinuously into a series of folds *a a* which lie in substantially parallel planes, and connecting ends *a'* which are substantially the same at one side of the wall as at the other, whereby the partition is adapted when embedded in the middle of the wall to furnish the same support for each side, said ends having a plurality of tongues projecting from them substantially at the junction of the folds and ends and in a direction substantially at right angles to the folds, combined with plaster, cement, or like material filling the spaces between the folds and covering the ends and tongues, substantially as specified.

3. A metallic partition, comprising a sheet of metal bent sinuously to form the folds *a a* which lie in parallel planes, and connecting ends *a'*, said partition having a plurality of integral tongues punched from said ends and bent around into positions at right angles substantially to the folds, combined with plaster, cement or like material filling the spaces between the folds and covering the ends and embedding the tongues, substantially as specified.

601,874. LECTURE-ROOM SEAT. HARVEY B. HEYDRICK and WILLIAM F. SMITH, Cleveland, Ohio, assignors to the Cleveland School Furniture Company, same place. Filed May 12, 1897. Serial No. 636,142. (No model.)

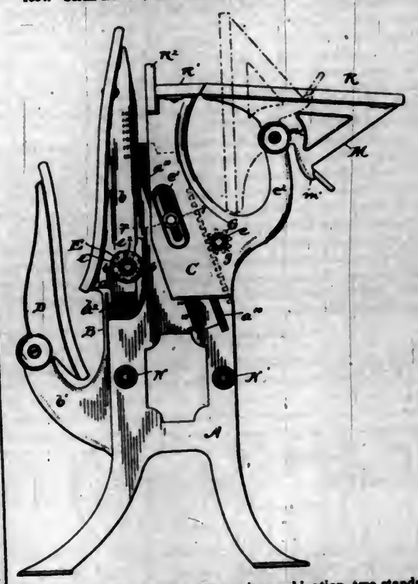
Claim.—1. In a lecture-room seat, in combination, an arm, an extension thereof pivoted at one end to said arm near its forward end and adapted to be turned about said pivot through the upper portion of a circle from an approximately horizontal forward position to an approximately horizontal rear position, and an arm-board pivoted to said extension and adapted to be approximately horizontal when said extension is in its forward position and approximately vertical when said extension is in its rear position, and one or more springs tending to retain said arm-board in its horizontal position when it is in that position, substantially as described.

2. In a lecture-room seat, in combination, the extension E pivoted to a support, the arm-board F, the bracket-arms G secured to said arm-board, the ears g on said bracket-arms, the rod H extending through said ears, and the springs J surrounding said rod and bearing at one end against the extension E and at the other against the bracket-arms, substantially as described.

3. In a lecture-room seat, in combination, the extension E pivoted to a support, the arm-board F, the bracket-arms G secured to said arm-board, the ears g on said bracket-arms the rod H extending through said ears, and the springs J surrounding said rod and having one end hooked onto a flange e^3 on said extension and the other onto the lug g^2 on the ear of said bracket-arm, substantially as described.

4. In a lecture-room seat, in combination, the extension E pivoted to a support, the arm-board F, the bracket-arms G secured to said arm-board, the ears g on said bracket-arms, the rod H extending through said ears, and the lug g^4 adapted to engage with said extension and limit the extent of movement of the bracket-arms away from said extension, and a spring forcing said bracket-arms toward said extension, substantially as described.

5. In a lecture-room seat, in combination, the extension E pivoted to a support, the arm-board F, the bracket-arms G secured to said arm-board, the ears g on said bracket-arms, the rod H extending through said ears and through ears on the extension whereby the bracket-arms may be swung substantially parallel with said extension, the lug g^4 adapted to engage with said extension and limit the extent of movement of the bracket-arms away from said extension, and elastic stops e^3 between said extension and said bracket-arms, said stops limiting the movement of the bracket-arms toward said extension, substantially as described.



6. In a lecture-room seat, the arm a, the extension E pivoted thereto and adapted to stand in a forward position in front thereof, the upper surface of said extension being below a prolongation of the upper surface of the arm a, an arm-board F pivoted to said extension, and adapted to stand approximately horizontal above the same, said arm-board when in this position having its lower surface below the said prolongation whereby the rear edge f of the arm-board and the front corner a^3 of the arm cooperate as a stop preventing the turning of the extension about its pivot when the arm is in its approximately horizontal position, substantially as described.

7. In a lecture-room seat, in combination, the arm a, the extension E pivoted thereto at e, the lug f and the stop a' limiting the movement of the extension in the forward direction, the arm-board F pivoted to said extension, a spring tending to hold said arm-board approximately horizontal, but allowing it to be tipped up into a substantially vertical position, whereby said extension may be folded over alongside of the arm a, substantially as described.

8. In a lecture-room seat, in combination, the side frame, having a forwardly-projecting arm, an extension E pivoted to the inner side of the front end of said arm on a transverse horizontal pivot, an arm-board, bracket-arms secured thereto having laterally-extended ears which are pivoted to the ears on the lower edge of said extension on a longitudinal horizontal pivot, and springs acting to turn said arm-board upon its pivot, substantially as described.

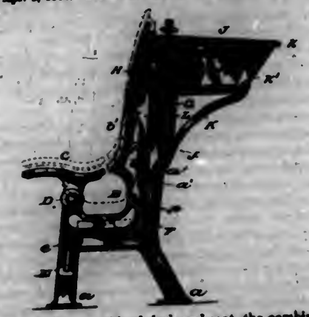
9. A lecture-room seat consisting of a continuous back B divided by a plurality of sides A, and seats C, in combination with the extension E pivoted to a side, the arm-board F pivoted to said extension and pressed toward an approximately horizontal position above the same by a spring, a slot through the back of the seat beyond said side, said arm-board being adapted to be folded back and project through said slot, substantially as described.

601,875. ADJUSTABLE SCHOOL FURNITURE. HARVEY B. HITSHEW and WILLIAM F. STIEFF, Cleveland, Ohio, assignors to the Cleveland School Furniture Company, same place. Filed May 12, 1897. Serial No. 636,143. (No model.)

Claim.—1. In school furniture, in combination, two standards, each having a rack on its front edge and a forward extension below said rack, with seat-supports, each having its lower part overlapping and in contact with the inner face of the forward extension of the standard, a pinion mounted on the inner side of each seat-support and in engagement with the adjacent rack, and means for forcing into intimate contact the overlapping parts of the seat-supports and standards, substantially as specified.

2. In school furniture, in combination, two standards each having a rack on its front edge, and a forward extension below said rack, and a flange which lies outside of and is coextensive with said rack, whereby the rack is hidden from view, seat-supports, the lower parts of which overlap and are in contact with the inner faces of the forward extensions of the standards, each seat-support being provided with an offset boss b^{13}, the rear edge of which extends in front of the flange on the corresponding standard, a pinion, lying against the inner face of each seat support in engagement with the adjacent rack on the standard, and having its hub rotatively secured in a hole in said boss, and means for clamping together the overlapping parts of the seat-supports and standards, substantially as specified.

3. In school furniture, in combination, two standards each having a vertical rack; and a forward extension, means for holding the rear part of said standards apart, two seat-supports which respectively overlap the forward extensions of said standards and are in contact with the inner faces thereof, a pinion rotatably mounted upon each seat-support above the part which overlaps the forward extension of the standard, and in engagement with the adjacent rack, said pinions being respectively in alinement and having each an angular hole adapted to receive an operating key or shaft, and mechanism for clamping together the overlapping parts of the seat-supports and standards, substantially as specified.



4. In adjustable school furniture, in combination, two standards each having a vertical rack, the horizontal and vertical boards J J' secured between them, two vertically-slotted seat-supports placed against the inner faces of said standards, said seat-supports and standards having interlocking tongues and grooves, a vertical board placed between said seat-supports in front of the front edge of the horizontal board J', the tie-rods N N', and the pinions mounted in said seat-supports, substantially as specified

5. In adjustable school furniture, in combination, two standards, each having a vertical rack on its front edge, and a forward projection, the inner surface of which projection is horizontally corrugated, a spacing-board held between the rear parts of said standards, two seat-supports which overlap the forward extensions of said standards and are in contact with the inner faces thereof, said contacting portion being likewise horizontally corrugated, a spacing-board secured to and between the lower part of said seat-supports, and two tie-rods, one connecting the rear parts of said standards, the other passing through vertical slots in the seat-supports and through holes in the standards, whereby the corrugated surfaces of the seat-supports and standards may be forced into intimate contact, and pinions mounted on the inner faces of said seat-supports adjacent to and in engagement with said racks, substantially as specified.

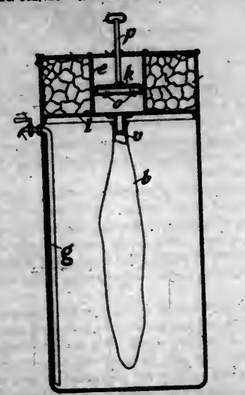
6. In adjustable school furniture, in combination, two standards, each having an inclined rack on its upper rear end, a correspondingly-inclined corrugated surface on the outer face thereof, a correspondingly-inclined channel on the other face, and a correspondingly-inclined slot through said corrugated surface and channel, two desk-supports having an inclined slot, and correspondingly-inclined corrugated surfaces on their inner faces, the plates K with bosses k, and bolts k', and pinions mounted on the desk-supports and engaging with the racks, substantially as specified.

7. In an adjustable school furniture, in combination, the standards each having a vertical rack on its front edge, and an inclined rack on its rear edge, a spacing device secured between said standards, two seat-supports movable against the inner faces of said standards, a spacing-board secured between them, pinions mounted on the inner faces of said seat-supports in engagement with said racks, two desk-supports mounted upon and in engagement with the outer faces of said seat supports, inclined guides therefor, pinions mounted on the inner faces of the desk-supports in engagement with the inclined racks, and clamping devices for securing the seat-supports and desk-supports to the standards, substantially as specified.

601,876. SCHOOL-DESK. ALBERT H. KENNEDY, Rockport, Ind., assignor to the Cleveland School Furniture Company, Cleveland, Ohio. Filed Apr. 1, 1897. Serial No. 630,201. (No model.)

Claim.—1. In a combined desk and seat, the combination with the standards, two desk-frames which slide thereon, two seat-frames which slide upon said standards, two vertical screws which engage with the standards and desk-frames, two vertical screws which engage with the seat-frames and standards, a desk-top secured to the desk-frames having holes, and an operating device adapted to project through said holes and engage with and simultaneously operate both desk-frame screws or both seat-frame screws, substantially as specified.

2. In school furniture, the combination with the standards, two connected frame members which slide respectively thereon, and two vertical adjusting-screws which engage with said standards and frame members, with a removable operating device consisting of a shaft N, yokes O O, vertical shafts journaled in said yokes and adapted to engage with the upper ends of said operating-screws, and bevel-gears on said vertical shafts and shaft N respectively, substantially as specified.



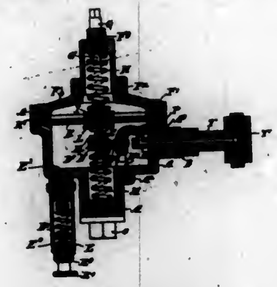
3. In a school-desk, the combination with the end frames made in separate sections and provided with cleats adapted to secure them one to the other in vertically-adjustable positions, of adjusting-screws for each of the end frames, and an operating device for simultaneously operating the adjusting-screws.

4. In a school-desk, the combination with the standards having beaded edges, and cleats extending from said edges, of desk-frames having beaded edges corresponding with those of the standards and adapted to engage the cleats extending from the edges of the standards, vertically-adjusting screws at each end of the desk, and a removable device for operating the adjusting-screws simultaneously.

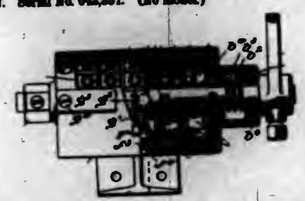
5. In a combined school desk and seat, the combination with the vertical standards having beaded edges and cleats extending therefrom and integral therewith, of the vertically-adjustable seat-frames similarly provided with beaded edges for engaging the cleats upon the standards and having also cleats extending over the beading of the standards, of vertically-adjusting screws arranged upon the inside of the said standards and means for operating said adjusting screws simultaneously to effect the desired adjustment.

6. In a combined school desk and seat, the combination with the vertical standards having beaded edges and cleats extending from both of said edges, of the vertically-adjustable seat-frames similarly provided with beaded edges for engaging the cleats upon the standards and having also cleats engaging the beaded edges of the standards, a desk having end frames provided with beaded edges adapted to engage the cleats upon the rear edges of the standards, and provided also with cleats extending over the said beaded edges of the standards, a screw-threaded block attached upon the inner side of each of the standards, a pair of adjusting-screws engaging the seat-frames and the blocks upon the standards, and a separate pair of adjusting-screws engaging the desk-frames and the said blocks upon the standards, said adjusting-screws being arranged on the inside of the seat and desk frames, and means for operating either pair of adjusting-screws simultaneously to effect the desired adjustment.

601,877. APPARATUS FOR TRANSPORTING AND PRESERVING LIQUIDS. PAUL LOCHMANN, Leipsic, Germany. Filed Aug. 14, 1896. Serial No. 602,732. (No model.)



Claim.—In an apparatus for transporting and preserving liquids, the combination with a vessel, of an elastic expeller within the vessel, a pump for inflating the expeller and forcing the contained liquid in the vessel through the outlet thereof, and a cooling-chamber surrounding the pump, substantially as set forth.



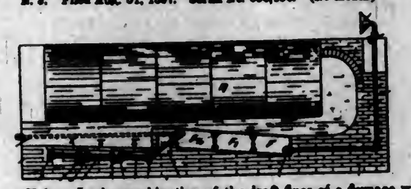
601,878. FLUID-PRESSURE REGULATOR. RICHARD MATCHETT, Melbourne, Victoria. Filed Feb. 27, 1897. Serial No. 625,272. (No model.)

Claim.—A fluid-pressure regulator, comprising the separable casings A F, provided with inlet and outlet pipes T and C, the diaphragm K interposed between said separable casings and forming an upper and lower chamber, a gripper comprising two independent blocks arranged on opposite sides of the diaphragm, the upper block being provided with a stud and the lower block with a screw, the adjustable threaded plug G having a reduced extension G', a coiled spring H, the end coils of which engage the extension and a stud of the screw and gripper sections respectively, and is confined between the

two, a post N³ having a screw-threaded engagement with the section A of the casing, a bell-crank lever journaled to said post and having at one end a valve to control the inlet-passage, and having at its other end a screw-threaded aperture through which projects the screw of the lower gripper-section, and by means of which the bell-crank may be adjusted to regulate its valve, a screw-threaded plug O secured to the lower section of the casing, a spring M surrounding the lower end of the screw and engaging the plug O, the adjusting-nut L³ on said screw above the end of the bell-crank lever, and the spring-actuated safety-valve E having the adjusting-plug E³, substantially as set forth.

601,879. COUNTER. JOHN F. McHUTT, Warren, Ohio, assignor to the Harris Automatic Press Company, Niles, Ohio. Filed June 25, 1897. Serial No. 642,231. (No model.)

Claim.—1. The combination with a casing having a sight-opening therein, of a shaft mounted in said casing, a series of dial-wheels on said shaft, and means for successively operating the same, a cap secured on said shaft, a spring engaging said shaft, and a stop adapted to limit the movement of said shaft by engaging with said cap, substantially as set forth.



2. The combination with a casing having a sight-opening therein, of a shaft mounted in said casing, a series of dial-wheels on said shaft, and means for successively operating said wheels, a stop projecting from one end of said casing, a cap secured on said shaft and having shoulders designed to engage said stop, and a spring encircling said shaft within said cap and connected to the latter, substantially as set forth.

3. The combination of a casing, a shaft mounted therein, dial-wheels on said shaft, and means for successively operating the same, a cap secured on the end of said shaft, a spring within said cap connected thereto at one end, its other end being secured to said casing, a stop adapted to limit the movement of said shaft, a lever engaged by one of said dial-wheels, a hammer carried by said lever, and a sounding-plate secured to said casing and adapted to be struck by said hammer, substantially as set forth.

4. The combination of a casing, a shaft mounted therein, dial-wheels on said shaft, and means for successively operating the same, a cap secured on the end of said shaft, a spring within said cap connected thereto at one end, its other end being secured to said casing, a stop adapted to limit the movement of said shaft, a spring-pressed lever engaged by one of said dial-wheels, a hammer carried by said lever, posts projecting from said casing, and a sounding-plate secured to said posts and adapted to be struck by said hammer, substantially as set forth.

5. The combination with the casing having an upper sight-opening, a lower opening and a hollow boss in line therewith, of a shaft extended through said casing having dial-wheels thereon, a lever fulcrumed in said lower opening and designed to be operated by one of said dial-wheels, a spring fitted in said boss and bearing against said lever, a hammer carried by said lever, and a sounding-plate secured to said casing and designed to be struck by said hammer, substantially as set forth.

601,880. BOILER-FURNACE. FRANCIS F. PARSONS, Paterson, N. J. Filed Aug. 31, 1897. Serial No. 650,126. (No model.)

Claim.—In the combination of the draft-flues of a furnace with the cross grate-bars, a hollow cross grate-bar, having its upward-slanting sides perforated, the ends of the said cross grate-bars furnished with holes, a draft-pipe system connecting said bars with each other, substantially as it is illustrated and described, for the purposes as set forth.

601,881. PLATFORM-SCALE. WILLIAM H. SANDERSON, Cleveland, Ohio, assignor to the National Computing Scale Company, same place. Filed May 24, 1897. Serial No. 637,903. (No model.)

Claim.—1. In a platform-scale, the combination of a platform having bifurcated legs, bearing-blocks loosely fitted in the furcations, a row of balls interposed between each block and the end of the corresponding furcation, plates F having beveled ends, which plates are secured to the lower ends of the legs and extend under the edges of the blocks, the inner ends of said plates being beveled, with the platform-levers, and knife-edges carried by said levers and adapted to support said bearing-blocks, substantially as specified.

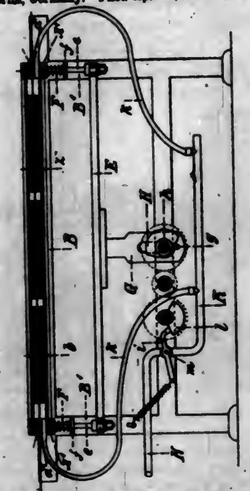
2. In a platform-scale, the combination of a platform having bifurcated legs, bearing-blocks loosely fitted in the furcations, the upper surface of each bearing-block and the surface forming the upper end of each furcation having depressions arranged in a row transverse to the furcations, a plurality of balls above each bearing-block in said depressions, the plates F secured to the lower ends of the legs and extending under the edges of the blocks and being at such distance therefrom as to prevent such a downward movement of the bearing-blocks as will permit the balls to escape from said depressions, substantially as specified.

3. In a platform-scale, the combination of a subplatform and a platform, with a set of ball-cups on the lower face of the platform, another set of ball-cups on the upper face of the subplatform some of said ball-cups being vertically adjustable, and a ball interposed between each pair of cups, substantially as specified.

4. In a platform-scale, the combination of a subplatform, a plurality of vertically-adjustable ball-cups secured thereto, with the platform having corresponding cups on its under side, and a ball between each pair of cups, substantially as specified.

5. In a platform-scale, the combination of a subplatform, a plurality of adjustable screws which screw vertically downward into said subplatform, said screws having cup shaped heads, with the platform having corresponding cups on its under side, and a ball between each pair of cups, substantially as specified.

6. In a platform-scale, the combination of the platform-levers and knife-edges carried thereby, the subplatform, bearing-blocks adapted to engage with said knife-edges, the upper face of the bearing-blocks and the proximate face of the subplatform being provided with correlated grooves arranged transversely to the knife-edges, balls in said grooves between the bearing-blocks and subplatform, means connecting the bearing-blocks and subplatform, which means permit the block to rock upon said balls, but prevent the block from moving far enough away from the subplatform to permit the escape of the balls from said grooves, the platform having ball-cups on its under surface, and the subplatform having correlated ball-cups on its upper surface, and a ball confined between each pair of said ball-cups, substantially as specified.



7. In a platform-scale, the combination of a subplatform having bifurcated legs and having lateral recesses above the furcations, adjustable bearing-blocks in said furcations, a plurality of threaded pins which pass vertically through the subplatform into said recesses, said pins having cup-shaped upper ends, a nut on said pins in said recesses, with a platform having corresponding cups on its under side, and a ball between each pair of cups, substantially as specified.

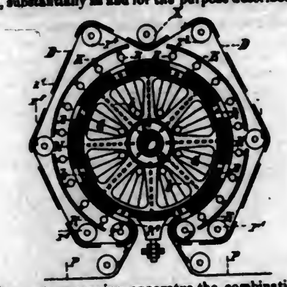
8. In a platform-scale, the combination of a subplatform having bifurcated legs, bearing-blocks loosely fitted in the furcations, a row

of balls between each block and the end of the corresponding furcation, plates F secured to the lower ends of said legs and extending under the blocks whereby the blocks are prevented from falling out of said furcations, vertically-adjustable cups secured to the subplatform, over said blocks, with a platform having corresponding cups on its under side, and balls between the platform and subplatform in each pair of cups, substantially as specified.

9. In a platform-scale, the combination of a subplatform and a platform, with a set of ball-cups on the lower face of the platform, one near each corner thereof, a set of ball-cups correspondingly disposed on the upper face of the subplatform, at least one of said last-named ball-cups being formed in the upper end of a support which is adjustable in the said platform, and a ball interposed between each pair of cups, substantially as specified.

601,882. PHOTOGRAPHIC-PRINTING APPARATUS. ARTHUR SCHWARZ, Berlin, Germany. Filed Apr. 12, 1897. Serial No. 631,767. (No model.)

Claim.—1. In a copying-frame, the combination of a rigid translucent plate at one side of the frame, a flexible transparent plate at the other side, to expose to the light on both sides of the frame photographic paper sensitized on both sides and insure the register of upper and lower negatives, said plates being arranged to leave a space between the two plates for the passage of the sensitized paper, and an air-exhauster communicating with said space, substantially as and for the purposes described.



2. In a copying-frame, the combination of a rigid upper frame, a movable lower frame, springs exerting an upward pressure on the lower frame, means for moving the lower frame against the pressure of said spring for the insertion of the paper and comprising a bar extending across the lower frame beneath the same and connected by upwardly-extending arms to the lower frame at opposite ends thereof, and means for releasing the lower frame to permit the springs to close the same against the upper frame, substantially as and for the purposes described.

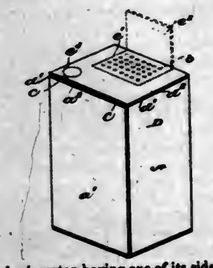
3. In a copying-frame, the combination of a stationary frame and a movable frame adapted to be brought together and leave a space between them, springs for closing one frame against the other, a cam actuating the movable frame to periodically draw it from the other against the influence of said springs, a valve-controlled air-exhaust in communication with the space between the two frames, and means for automatically actuating the valve in the air-exhaust after the frames have been brought together for the purpose of exhausting air from the space between the frames, substantially as set forth.

601,888. PHOTOGRAPHIC-PRINTING APPARATUS. ARTHUR SCHWARZ, Berlin, Germany. Filed May 7, 1897. Serial No. 635,508. (No model.)

Claim.—1. In a rotary pneumatic copying apparatus the combination of a rotary cylinder with a pressure-blanket traveling with said cylinder and means for forming a vacuum between the cylinder and the blanket, substantially as and for the purpose described and set forth.

2. In a rotary pneumatic copying apparatus the combination of a rotary cylinder with disks equipped with air-ducts, said air-ducts connecting the space between the surface of the cylinder and the pressure-blanket with the hollow axle upon which the cylinder is mounted, substantially as and for the purpose described and set forth.

3. In a rotary copying apparatus the combination of a rotary cylinder with a pressure-blanket circulating around and covering nearly the entire surface of the cylinder, air-openings for the evacuation of the air between the cylinder and the blanket and a sliding spring-actuated guard adapted to close the air-holes not covered by the blanket, substantially as and for the purpose described and set forth.



4. In a rotary copying apparatus the combination of a rotary cylinder provided with disks B B' and mounted upon a hollow shaft, air-holes provided in the shaft and ending in a circular groove in the hub of said disks, air-passages provided in the spokes of the disks and connecting the space between the cylinder and the pressure-blanket with the hollow shaft, substantially as and for the purpose described and set forth.

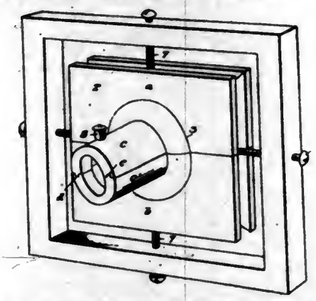
5. In a rotary copying apparatus, the combination of a rotary cylinder, and a shaft inside of said cylinder rotatable in the opposite direction to the cylinder and carrying a lighting medium for the exposure, substantially as and for the purposes described.

6. In a rotary copying apparatus, the combination of a rotary cylinder, and means for creating a circulation of air within the cylinder for ventilating and cooling the interior of the cylinder, substantially as and for the purposes described.

7. In a rotary copying apparatus, the combination with a rotary cylinder, of a shaft within the cylinder and rotatable at a different speed from the cylinder, and means connected to said shaft for creating an air-current within the cylinder for ventilating and cooling the interior of the cylinder, substantially as and for the purposes described.

601,884. CARTON. FRANK P. TUCKER, Somerville, Mass. Filed Aug. 21, 1897. Serial No. 648,999. (No model.)

Claim.—1. A carton having one of its sides provided with a flap having a series of indentations therein, a plate fitted over said flap having perforations therein corresponding to the indentations of said flap and a second flap fitted over said plate, and having a removable portion adjacent the latter.

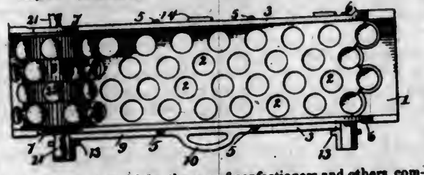


2. A carton having its sides provided with end flaps, and a perforated plate fitted over a portion of one of said flaps and having a flanged edge and ends fitting against the edges of said flap, substantially as set forth.

3. A carton having its sides provided with end flaps, and a perforated plate fitted over a portion of one of said flaps, one of the remaining flaps being designed to fit over said former flap and plate and having a scored line thereon, substantially as and for the purpose set forth.

4. The herein-described carton consisting of the box having one side provided with a flap, a perforated plate fitted thereon, opposite flaps having cut-aways and fitted down over said former flap, and an

outer flap having a scored line for forming a small flap or section located over the perforations in said plate, substantially as set forth.

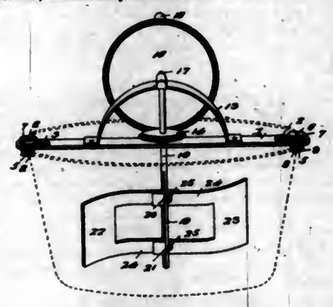


601,885. SHAFT-HANGER. SAMUEL COFFIN, High Point, N. C. Filed Nov. 29, 1897. Serial No. 660,139. (No model.)

Claim.—1. In a shaft-hanger, the combination with a two-part casing, each part having a semicircular groove and coacting lugs and recesses, of a bearing consisting of two parts having coacting ribs and grooves, and provided with semicircular convex bulges to seat in the grooves of the casing; and provided with an interior oil-chamber, substantially as set forth.

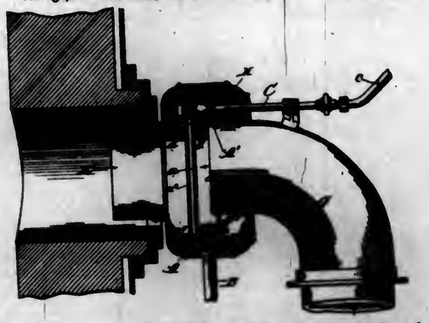
2. In a shaft-hanger, the combination with a frame provided with radially-disposed set-screws, of a two-part casing supported in said frame, and provided with an annular central groove, and a two-part bearing having an annular curved bulge to fit in said groove to form a ball-and-socket joint, substantially as set forth.

601,886. MOLDING-MACHINE FOR CONFECTIONERS' USE. JOHN S. CROWELL, Springfield, Ohio. Filed July 1, 1897. Serial No. 643,152. (No model.)



Claim.—1. A mold for the use of confectioners and others, comprising a horizontal bed-plate provided with a series of orifices, the side rails 3 3 fixed thereto and provided with the shoulders 6 6, and the plane platen 9 removably secured contiguous to the lower face of said bed-plate, in combination with the roller 8, provided with flanges 7 7, and the radial plungers 23 23, substantially as shown and described.

2. The bed-plate 1, provided with a series of orifices 2 2, the side rails 3 3, adjustably secured thereto, and the transverse guides 11 11 secured to the lower face of said bed-plate, in combination with the laterally-sliding platen 9, having a transverse movement in said guides, and the roller 8 provided with plungers 23 23 and the flanges 7 7, substantially as shown and described.



3. The combination with the orificed bed-plate, the side rails and the movable platen 9, of the roller 8, formed of the sectional rings 22 22, provided with radial plungers 23, and the disks 19 and 20 and stay-rods 25, connecting said disks and rings, substantially as shown and described.

601,887. CAKE-BEATER. ALBERT W. CUSTER, New Whatcom, Wash. Filed Mar. 16, 1897. Serial No. 627,863. (No model.)

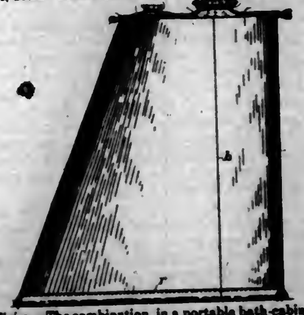
Claim.—The horizontal supporting-brace 1, provided at its outer ends with longitudinal slots 2 3, the guide-clamps 5 5 formed with the square shank 4, which engage said slots, and the vertical threaded stud 6 provided with the thumb-nut 7, and having the vertical recess 8 and thumb-screw 9, and the central bearing 12 in combination with the curved bracket 13, provided with the horizontal stud 17, the vertical cylindrical shaft 10 journaled in the bearing 12 and curved bracket 13 and having the integral depending rectangular portion 19 provided with the transverse slots 20 21 and thumb-screws 25, the curved radial paddles 22-23, having horizontal parallel arms 24 24 adapted to engage said slots 20 21, the bevel gear-wheel 16 mounted on said stud 17 and the bevel-pinion 14, adjustably secured to the shaft 10 by the set-screw 15, its hub forming a support for the said shaft and having its beveled toothed face meshing with the larger gear-wheel 16, substantially as shown and described.

601,888. GAS-WASHING APPARATUS. ALBERT H. DEACON, Chicago, Ill. Filed May 13, 1897. Serial No. 636,574. (No model.)

Claim.—1. In a gas-washing apparatus, the combination of a disk or similar element, a nipple screw-threaded in the upper portion thereof and provided with longitudinal lateral openings, a water-distributer secured to the threaded nipple and provided with a supply-opening at one portion thereof, a feed-pipe screw-threaded into and connected with the water-distributer so that such distributer may be rotated therewith, a waste-pipe for carrying off the water, and a gas-supply pipe arranged with its outlet-opening adjacent to the surface of the disk, substantially as described.

2. In a gas-washing apparatus, the combination of a disk provided with a water-jacket, a water-distributer arranged in the upper portion thereof so as to flow a sheet of water down and over the inner surface of the disk, a water-discharge pipe connected with the lower portion of the disk, a gas-supply pipe arranged with its outlet adjacent to the face of the disk, and a casing provided with an outlet surrounding the disk and outlet of the gas-supply pipe to compel the gas after being cleansed to pass out through the outlet of such casing, substantially as described.

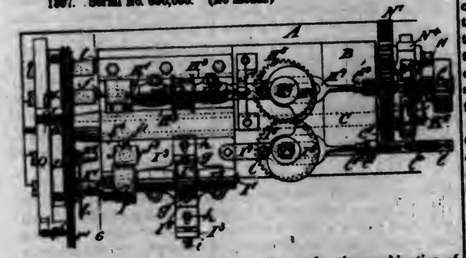
601,889. NUT-LOCK. JOHN HARRIS, Shamokin, Pa. Filed Dec. 22, 1897. Serial No. 662,903. (No model.)



Claim.—The combination with a grooved bolt, a nut having a rib adapted to said bolt, a clamping-nut having at its base diagonal communicating recesses intersected by an aperture, a band for encompassing both nuts provided with an aperture, and a split key adapted to be inserted through the apertures of the band and nut and to have its ends spread apart by the diagonal recesses, substantially as set forth.

601,890. CLAMP FOR BICYCLE-SADDLES. JONATHAN A. HUNT, Westborough, Mass. Filed Jan. 26, 1897. Serial No. 620,566. (No model.)

Claim.—1. In a clamp for bicycle-saddle springs, the combination with the casing or shell split or divided at one side or end, and having a tubular internal-threaded extension on said divided end, and a collar or holding-band thereon, and a bolt turning in said tubular extension, to communicate direct pressure in a horizontal plane, to the clamping-jaws, of two clamping blocks or jaws having grooved or recessed inner edges, and grooved or recessed outer edges, substantially as shown and described.



2. In a clamp for bicycle-saddle springs, the combination with the casing or shell split or divided at one side or end, and having a tubular internal-threaded extension on said divided end, and a collar or holding-band thereon, and a clamping-bolt turning in said tubular extension, of two clamping blocks or jaws having grooved or recessed inner edges, and grooved or recessed outer edges, and a third clamping-block, against which the inner end of the clamping-bolt bears, substantially as shown and described.

601,891. PORTABLE BATH-CABINET. RUSSELL M. IRWIN, Nashville, Tenn. Filed Sept. 10, 1897. Serial No. 651,157. (No model.)

Claim.—The combination, in a portable bath-cabinet, of a round, flexible and apertured top, having a soft elastically-gathered collar, centrally placed near the rear part thereof, and a soft elastically-gathered sleeve to the right and front of said collar; a flexible wall descending from said top, in straight-down lines around the rear part thereof, and in outwardly-expanding lines around the front part thereof—the upper part of said wall being gathered beneath and within the rim of the aforesaid top, and formed into a casing, overhanging said wall, having a reinforced slot in the edge thereof, and the lower part of said wall being formed into a casing around the bottom thereof and having a reinforced slot in the outer face of said casing; and a pair of flexible and integral framing-wires, dimensioned, respectively, to the aforesaid upper and lower casings of the said wall, and provided each with a socket at one end of said wire; the whole constructed and arranged as hereinbefore fully described.

601,892. MACHINE FOR CUTTING CORKS. JULIUS JONSON, New York, N. Y., assignor to Rose Jonson, same place. Filed Mar. 31, 1897. Serial No. 630,063. (No model.)

Claim.—1. In a machine for cutting corks, the combination of an intermittently-rotating carrier, a series of tubular chucks arranged in said carrier in a circle concentric therewith and adapted for the insertion and passage directly through them of sticks of cork, and a cutter, consisting of a hollow cutter-stock and a cutter-blade projecting therefrom for turning portions of said sticks which are successively protruded through the said chucks and carrier, all in combination substantially as herein described.

2. In a machine for cutting corks, an intermittently-rotating carrier, a series of revolving tubular chucks arranged in bearings in said carrier with their axes in a circle concentric to and parallel with the axis thereof and adapted for the passage through them of sticks of cork, a rotary grinder having its axis parallel with the axis of the carrier and with the axes of the chucks, for grinding the sides of portions of sticks which pass through and protrude beyond said chucks and carrier, and a stationary holder for receiving the said protruding portions of the sticks during the grinding, all in combination substantially as herein described.

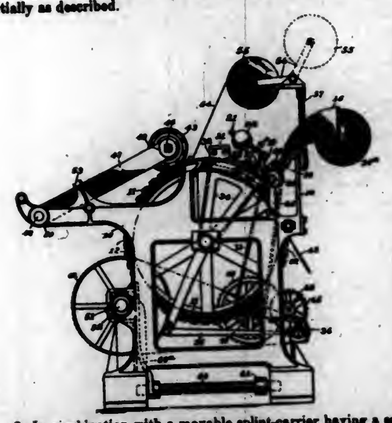
3. In a machine for cutting corks, the combination of an intermittently-rotating carrier, a series of tubular chucks arranged in said carrier and adapted for the passage through them of sticks of cork, a turning-cutter consisting of a hollow stock and a cutting-blade projecting therefrom and opposite to which the said chucks are brought by the rotation of the carrier for the purpose of turning portions of sticks of cork which are successively protruded through the said chucks and carrier, and means for moving said cutter toward and from the chucks to receive the successively-protruded portions of the sticks during the intermissions of the rotation of the carrier, substantially as herein described.

4. In a machine for cutting corks, the combination of an intermittently-rotating carrier, a series of revolving tubular chucks arranged in bearings in said carrier and adapted for the passage through them of sticks of cork, a rotary grinder in proximity to which the said chucks are brought by the rotation of the carrier for the grinding of portions of the sticks successively protruded through the chucks, and means for drawing back said grinder in lines parallel with the axis of rotation of the carrier during the intermissions of the rotation of the latter to permit the passage by of the so-protruded portions of the sticks, substantially as herein described.

5. In a machine for cutting corks, the combination of an intermittently-rotating carrier, a series of revolving open tubular chucks fitted to bearings in said carrier, a hollow rotary turning-cutter which incloses the work and a rotary grinder opposite to which the said chucks are successively brought by the rotation of the carrier and retained during the intermissions in the rotation thereof, means for preventing the turning of that chuck which is at any time opposite the said cutter and while a stick in said chuck is being turned by the rotation of said cutter around it, and means for at the same time giving rotary motion to another chuck which is at the same time opposite the grinder for the purpose of presenting all sides of said stick to the grinder, substantially as herein described.

6. In a machine for cutting corks, the combination of an intermittently-rotating carrier, chucks fitted to turn in bearings in said carrier and provided each with a band-pulley and a ratchet-wheel, a hollow rotary cutter which incloses the work, a rotary grinder opposite to which said chucks are successively brought by the rotation of the carrier, a driving-belt, a stationary support and guide-pulleys attached thereto for guiding the said belt over the pulley of a chuck which is opposite the grinder for driving that chuck, and a pawl for engaging with the ratchet-wheel of a chuck which is opposite the cutter for preventing the rotation of the latter chuck, substantially as herein described.

7. The combination with the rotary grinder, of a cork-holder consisting of a socket closed at one end and open at the other and having a lateral opening for the periphery of the grinder, and a pivot in the closed end of the holder provided with teeth at its inner end, substantially as herein described.



8. The combination of the intermittently-rotating horizontal shaft C, the carrier D on said shaft, the chucks E in said carrier, the rotary cutter H *e* opposite to which the chucks are brought by said carrier, the upright rotary shaft H^6, the cam H^5 on said shaft H^6 for moving the cutter toward and from the carrier during the intermissions of the rotation of the latter, the stop-lever P for arresting the rotation of the carrier, and the cam P^5 on said shaft H^6 for operating said stop-lever and means for rotating the shafts C and H^6, all substantially as herein described.

9. The combination of the intermittently-rotating horizontal shaft C, the carrier D on said shaft, the chucks E in said carrier, the rotary cutter H *e* and the rotary grinder I opposite to which the chucks are successively brought by said carrier, the upright rotary shaft H^6, the cam H^5 on said shaft H^6 for moving the cutter toward the carrier, the upright pivot I^5 and the cam I^5 thereon for moving the grinder toward the carrier, and the gears H^5 I^5 on the said shaft H^6 and cam I^5 respectively for producing the rotation of said cam I^5, all substantially as herein described.

601,898. MACHINE FOR CUTTING AND ASSEMBLING MATCH-SPLINTS. JOHN F. KAY, Passaic, and DANIEL HUTCHINSON, Bound Brook, N. J., assignors to the Diamond Match Company, Chicago, Ill. Filed Sept. 3, 1897. Serial No. 650,491. (No model.)

Claim.—1. In combination with a movable splint-carrier having a series of splint receiving and holding devices adapted to hold the splints in a position transverse to the line of travel of the carrier,

means for moving the carrier, means for feeding a strip or sheet of veneer toward the carrier and into its splint receiving and holding devices, as such devices are brought successively up to the path of the veneer, so that the forward end of such veneer, will lie transversely, with reference to the carrier, in each holding device into which it is fed and a cutting device operating close to the face of the carrier to cut off from the rest of the veneer the portions of the latter projecting into the receiving and holding devices of the carrier, substantially as described.

2. In combination with a movable splint-carrier having a series of transverse grooves to hold the splints, means for feeding the veneer into such grooves, so that its forward edge, extending in a direction transverse to the carrier, will project into the grooves as they are brought, by the movement of the carrier, to a certain point, and a cutting device to cut off the portions of the veneer projecting into the carrier-grooves, substantially as and for the purpose described.

3. In combination with a movable splint-carrier having a series of transverse splint-holding grooves, a suitable way or support for a strip of veneer, feed mechanism to feed the veneer forward into each groove in the carrier, as such groove is brought by the movement of the carrier into position in front of the veneer, so that the forward edge of the veneer, extending in a direction transverse to the carrier, will be seated in the groove and means for cutting the veneer, close to the face of the carrier after the veneer has been moved into a groove in the carrier substantially as and for the purpose described.

4. In combination with a suitable table for supporting a sheet of veneer, a movable carrier with transverse splint-holding grooves moving past such table, means for feeding the veneer forward, with its forward edge transverse to the carrier to cause it to project into the grooves in the carrier, as they are successively brought, by the motion of the carrier, into position opposite the end of the veneer, and a reciprocating knife acting close to the face of the carrier to cut off from the veneer each portion thereof projected into a groove in the carrier, substantially as and for the purpose described.

5. In combination with a movable splint-carrier, having a series of transverse splint-holding grooves, and a tape-receiving groove at right angles to the other grooves, a support for a strip of veneer past which the carrier moves, means for feeding the veneer forward into the transverse grooves of the carrier, as they are successively brought opposite the veneer by the movement of the carrier, and means for cutting off each portion of the veneer so projected into each groove of the carrier, substantially as and for the purpose described.

6. In combination with a movable splint-carrier having a series of transverse splint-holding grooves and a tape-receiving groove at right angles to and deeper than the other grooves, a veneer-supporting table past which the carrier moves, having a portion projecting into the tape-receiving groove, means for feeding the veneer forward into the transverse grooves in the carrier, as they are successively brought opposite the veneer by the movement of the carrier, and means for cutting off the portion of the veneer so projected into each groove in the carrier, substantially as and for the purpose described.

7. In combination with a movable carrier, having a series of transverse splint-holding grooves and a tape-receiving groove at right angles to and deeper than each transverse grooves, a veneer-supporting table, past which the carrier moves, having a portion extending into the tape-receiving groove in the carrier, and a transverse knife-edge-receiving groove, means for feeding a strip of veneer on the table forward, to cause it to project into the transverse grooves in the carrier, as such grooves are brought successively up to a certain point by the travel of the carrier, and a traveling knife to cut off the portions of the veneer so projected into the grooves of the carrier, substantially as and for the purpose described.

8. In combination with a movable carrier having a series of transverse splint-holding grooves, means for feeding a sheet of veneer to cause it to project into the carrier-grooves, with its forward edge transverse to the carrier and substantially parallel with the grooves as they are successively brought to a certain position by the travel of the carrier, and a veneer-cutting knife moving close to the face of the carrier, so as to cut off the portions of the veneer which are projected into the grooves of the carrier, substantially as and for the purpose described.

9. In combination with a movable carrier, having a series of transverse splint-holding grooves, feed devices to feed a strip of veneer forward into each one of the carrier-grooves as it is brought opposite the veneer by the movement of the carrier so that the forward portion of the veneer will be seated in the groove transverse to the carrier, and a reciprocating knife moving across the path of the veneer close to the face of the carrier, and means for actuating such knife each time that the veneer is moved into a carrier-groove so as to cut off the part of the veneer seated in such groove, substantially as and for the purpose described.

10. In combination with a movable carrier having a series of transverse splint-holding grooves with their forward sides beveled or inclined, feed devices to feed a strip of veneer forward into the grooves, as they are successively brought, by the movement of the carrier, into position to receive the veneer, a knife to cut off the portion of the veneer fed into each groove, moving close to the face of the carrier so as to cut the veneer transversely and to sever the part which rests in the carrier-groove from the rest of the strip of veneer outside of the groove leaving such part in the form of a splint lying transversely in the groove, and means for actuating such knife, substantially as and for the purpose described.

11. In combination with a movable grooved splint-holding carrier, a support for a strip of veneer, one or more rapidly-revolving feed-rolls, to feed the veneer on the support toward the carrier with its forward edge transverse to the carrier, and substantially parallel with the grooves in the latter, a cutter to cut the veneer close to the face of the carrier, and means for actuating it to cut the veneer, each time that the latter is fed into a carrier-groove after the veneer has been fed into the groove, substantially as and for the purpose described.

12. In combination with a series of parallel grooved splint-carriers having corresponding splint-holding grooves, means for moving such carriers, means for feeding into the grooves of the carriers a strip of veneer of a width equal to the length of a series of splints, sufficient in number to afford one splint for each carrier, a cutter to cut off the veneer close to the face of the carriers, means for actuating such cutter to cause it to cut the veneer each time that it has been fed into the grooves of the carrier, feed mechanism to feed the veneer into the grooves of the carrier, and means for cutting the splints transversely between the carriers, substantially as and for the purpose described.

13. In combination with two parallel grooved movable splint-carriers, means for feeding into the corresponding grooves of the two carriers, a strip of veneer of a width equal to the length of two matched splints, a cutter to cut the veneer transversely, close to the face of the carriers after it has been fed into the grooves of the latter, and a second cutter to divide the splints between the two carriers, substantially as and for the purpose described.

14. In combination with a series of parallel transversely-grooved splint-carriers and means for moving them, means for feeding a strip of veneer into the grooves of the carriers, a reciprocating knife adapted to cut the veneer close to the carriers, after it has been fed into the latter, a splint-dividing knife, moving with the former knife, to cut the splints in two between the carriers, and means for actuating the knives so that the veneer-cutting knife will cut the veneer each time that the latter has been fed forward into the corresponding grooves of the two carriers, substantially as and for the purpose described.

15. In combination with a movable carrier with transverse splint-holding grooves, and a tape-groove at right angles to the other grooves, a coiling device to coil up such tape, means for actuating such device, a support for a strip of veneer, means for feeding such veneer toward the carrier, so that it will be projected into each transverse groove in the carrier, as such groove is brought opposite the veneer by the motion of the carrier, and means for cutting off each portion of the veneer so projected into a carrier-groove, substantially as and for the purpose described.

16. In combination with a movable carrier with transverse splint-holding grooves and a tape-groove at right angles to such grooves, a coiling tape passing through a portion of the tape-groove, a support for a strip of veneer, means for feeding such strip forward toward the carrier, to cause it to enter each transverse carrier-groove, as it is brought up to the veneer by the travel of the carrier, means for cutting off from the veneer each portion so projected into a carrier-groove, a second coiling tape above the splints in the carrier-grooves, and a rotary coiling device with which the two tapes are connected, substantially as and for the purpose described.

17. In combination with a rotary wheel having a series of transverse splint-holding grooves, and a circumferential tape-receiving groove, a coiling tape, a support for a strip of veneer, means for feeding such veneer toward the grooved wheel, so that it will enter each transverse groove therein, as such groove is brought up opposite the veneer by the rotation of the wheel, cutting mechanism to cut the veneer close to the face of the wheel, each time that the veneer has been moved to cause it to enter a wheel-groove, and a coiling device with which the coiling tape is connected, substantially as and for the purpose described.

18. In combination with a rotary wheel having a series of transverse splint-holding grooves, a reciprocating head moving over the face of the wheel close thereto, a knife carried by such head, means for feeding a strip of veneer into the grooves of the wheel, and means for actuating the head to cause the knife to cut the veneer, after it has been fed into a groove in the wheel, substantially as and for the purpose described.

19. In combination with a rotary wheel having a series of transverse splint-holding grooves, means for feeding a strip of veneer into such grooves, as they are brought successively opposite a certain point, a head having its inner or under side close to the face of the wheel, a veneer-cutting knife on the head, and means for reciprocating the head in a curved path substantially concentric with the wheel, substantially as and for the purpose described.

20. In combination with a rotary wheel having a series of transverse splint-holding grooves and a circumferential coiling-tape-receiving groove, means for feeding a strip of veneer into the transverse grooves, as they are successively brought by the rotation of the wheel up to a certain point, a swinging frame moving in a path concentric with the wheel, means for swinging such frame back and forth, a head carried by each frame moving close to the face of the wheel, and a knife on each head having its edge moving close to the wheel-face and across the path of the veneer from the veneer-feeding means, a coiling tape passing through a part of the circumferential groove in the wheel, and coiling devices for taking the tape from the wheel and coiling it up, substantially as and for the purpose described.

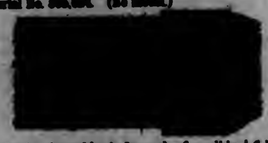
21. In combination with a rotary wheel having a series of transverse splint-holding grooves, means for feeding a strip of veneer into such grooves as they are successively brought up to the path of the veneer by the rotation of the wheel, a head reciprocating in a path concentric with the face of the wheel, and having a plate-like extension carved in a line substantially concentric with the wheel-face, a cutter moving with the head, having its edge adapted to cut through the veneer close to the wheel-face, and means for reciprocating such head, substantially as and for the purpose described.

22. In combination with two rotary wheels having corresponding splint-holding grooves, means for feeding a strip of veneer into the grooves of the wheels as they are brought successively up to a given point, a reciprocating head moving close to the faces of the wheels, a transverse cutter on the head to cut the veneer after it has been fed into the wheel-grooves, a second cutter moving with the head, arranged to cut the splints in the wheel-grooves in two at a point between the wheels, and means for reciprocating the head, substantially as and for the purpose described.

23. In combination with a movable carrier having a series of transverse splint-holding grooves of a depth to receive and hold a splint, a table to support a sheet of veneer, a feed-roller to engage one side of the veneer upon the table, a second feed-roller to engage the other side of the veneer, journaled in a swinging weighted frame, gearing connecting the two rollers, means for rotating one of the rollers, and means for cutting across the sheet of veneer operating close to the face of the grooved carrier, so as to sever from the rest of the veneer the portion of the veneer seated transversely in any one of the carrier-grooves, substantially as and for the purpose described.

24. In a feed mechanism, the combination of a pair of rollers, a movable support for one roller, a projection connected with said support, and an eccentric journaled on the shaft of the other roller, and engaging said projection, substantially as and for the purpose described.

25. In combination with a movable carrier having a series of splint-holding grooves, a suitable table for supporting a sheet of veneer, having a projection alongside of the grooved part of the carrier, and a knife-edge-receiving groove in a plane close to the surface of the carrier, means for feeding the veneer over the table and into the carrier-grooves, as the latter are brought successively opposite the path of the veneer, and a cutting device having its knife-edge adapted to cut the veneer when fed into the grooves, and enter the groove in the table.

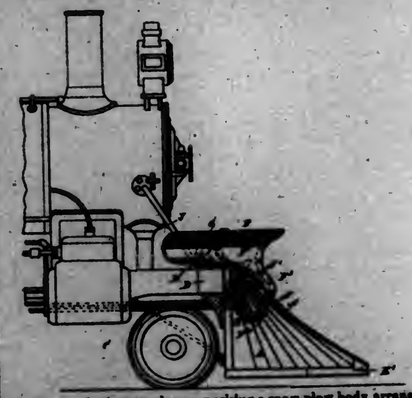


26. In combination with a suitable table for supporting a sheet of veneer, a movable carrier with splint-holding grooves, means for feeding the veneer to cause it to project into the carrier-grooves as they are brought successively opposite the end of the veneer, a knife and means for actuating it, the table having a portion projecting across the path of the knife provided with a groove for the entrance of the knife, that opens beyond the point to which the knife reaches on entering it, substantially as and for the purpose described.

27. In combination with a movable carrier having a series of transverse splint holding grooves, a table to support a strip of veneer having a portion extending across the path of the knife close to the face of the carrier and provided with a transverse knife-edge-receiving groove with one or more clearing-passages connected with its rear side, means for feeding a strip of veneer over the table and into the carrier-grooves, a reciprocating knife to cut the veneer, and means for removing such knife to cause it to pass into and from the groove in the table, substantially as and for the purpose described.

28. In combination with a movable carrier having splint-holding grooves, a cutter-carrying head, movable to and fro adjacent to the grooved surface of the carrier, a shield also adjacent to such surface, and a projection from the head into an opening in the shield, substantially as and for the purpose described.

29. In combination with a wheel having peripheral, splint-holding grooves, a veneer-feeding mechanism, a cutter-carrying head reciprocating adjacent to the periphery of and concentric with the wheel, a shield also adjacent to said periphery, a projection from the head into an opening in the shield, a tape and a tape-coiling spool, substantially as and for the purpose described.



601,894. KNIT MITTEN. ISAAC W. LAMB, Perry, Mich., assignor to the Lamb Glove and Mitten Company, same place. Filed June 15, 1896. Serial No. 595,694. (No model.)

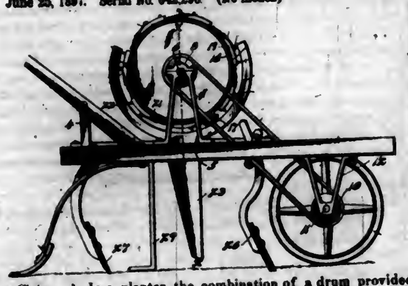
Claim.—1. A mitten-blank formed of a ribbed fabric having a main portion and a tip of a different rib style than the said main portion, the tip being formed by the stitches narrowed in all the courses at the inside, and with some of the stitches narrowed in the last courses and at the outside of the tip, substantially as shown and described.

2. A mitten-blank formed of a ribbed fabric having a main portion and a tip of a different rib style than the said main portion, the tip having stitches narrowed in all the courses at the inside of the tip and with some of the stitches narrowed in the last courses and at the outside of the tip, the meshes in all the courses being closer than those of the preceding courses, substantially as shown and described.

601,895. SNOW-PLOW. WILLIAM R. LLOYD, New York, N. Y. Filed Sept. 23, 1897. Serial No. 652,737. (No model.)

Claim.—1. A snow-plow comprising a snow-plow body arranged for extension over the pilot and formed near its upper end with an opening for the passage of the draw-bar, couplings, &c., and a movable cleaner on the upper portion of the said body and normally closing the said opening, the said cleaner being movable to uncover the said opening for passing the draw-bar and couplings through the said opening, substantially as shown and described.

2. A snow-plow provided with a body arranged for attachment to the pilot of the locomotive, a clearer fulcrumed on the upper portion of the said body and normally resting thereon, and means substantially as described, for locking the said clearer in place on the said body, substantially as set forth.



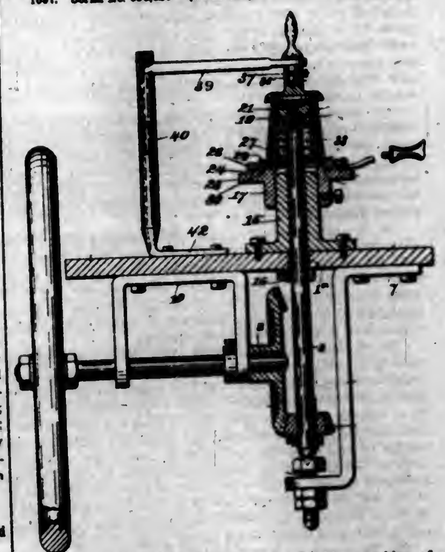
3. A snow-plow provided with a body extending over the pilot of the locomotive and provided at its lower end with a frame for connection with the pilot, the upper end of the said body being attached to the buffer-beam of the locomotive, and a clearer having wings standing at angles to each other and pivoted on the upper end of the said body, the said clearer normally resting on and being locked to the upper portion of the said body and arranged to swing out of engagement with the body to uncover an opening in the upper portion thereof for the passage of the draw-bar, couplings, &c., substantially as shown and described.

601,896. RUNNING-GEAR FOR RAILWAY-CARS. ARIARD J. LODRIGUES, Belle Rose, La. Filed Nov. 19, 1897. Serial No. 659,160. (No model.)

Claim.—In an improved truck for railway-cars the combination with the main cross-beam of the herein-described extension-bars 3, reinforced by twisted diagonal braces 2; the transverse bars 10 connecting the double series of extension-bars; the wheels provided with separate axles 16, journaled in antifriction-boxes 4; the rotatable block 8; the laterally-swinging coupling-bars 9 attached thereto; the bolster 5, supported at its ends and center by springs 6 and 7; the supplemental removable bolster 18, adapted to swing laterally as shown and provided at its ends with adjustable standards; all constructed and arranged substantially as and for the purposes herein specified.

601,897. PLANTER. EUGENE MICHOS, Grand Chenier, La. Filed June 25, 1897. Serial No. 642,296. (No model.)

Claim.—1. In a planter, the combination of a drum provided with a series of discharge-openings, a band encircling the drum and having a longitudinal slot and graduations at one side of the slot, and provided with openings corresponding with the said discharge-openings and a fastening projecting from the drum and operating in the longitudinal slot of the band and serving to retain the latter in a located position and to act jointly with the graduations to properly position the band with respect to the drum to secure the required size and form of discharge-openings, substantially as set forth.



2. In a planter, the combination of a rotatable drum having a series of discharge-openings, a band encircling the drum and provided with a corresponding series of openings, and adjustable to vary the size of the openings, and a cut-off for each opening of the band applied directly thereto and movable therewith, substantially as set forth.

3. In a planter, the combination of a drum having a series of openings around its circumference, a band encircling the drum and having a corresponding series of openings, a cut-off for each opening of the band, and a spring for each cut-off to hold it either open or closed, substantially in the manner set forth for the purpose described.

4. In a planter, the combination of a drum having a discharge-opening, a cut-off for the said opening having a projection, and a spring disposed to engage with the projection to hold the cut-off open and to bear against the latter and hold it closed, substantially as set forth.

5. In a planter, the combination of a drum having a series of openings around its circumference, a band encircling the drum and having a corresponding series of openings, means for adjusting the band to vary the size of the openings and securing it when positioned, a cut-off for each opening of the band, and means for holding the cut-offs either open or closed, substantially as set forth.

601,898. MACHINE FOR FINISHING GLASSWARE. PATRICK J. MCDONOUGH and THOMAS H. SHELLY, Bellaire, Ohio. Filed Nov. 17, 1897. Serial No. 658,836. (No model.)

Claim.—1. The combination in a glass-finishing machine, of a bearing-sleeve, a collar having a circular groove and adjustable on the sleeve, means to adjust the collar, a ring having a tongue to engage said groove, and a gage-rim upon the opposite side of the ring from said tongue, as set forth.

2. A tumbler-supporting and gage ring for glass-finishing machines, comprising a lateral outer flange, an inner flange, a bottom tongue, a top rim, and a suitable handle, as set forth.

3. A split ring forming a bearing and a gage for an article in a glass-finishing machine, comprising an inner grooved flange, an outer flange a handle thereon a top gage-rim, and a tongue opposite the said rim, as set forth.

4. The combination of a sleeve forming a shaft-bearing, a collar adjustable on the sleeve, means to adjust the collar, and a rotatable tumbler-carrying gage-ring upon the top of the said collar, as set forth.

5. In a glass-finishing apparatus, the combination, with the driving mechanism having a vertical shaft, and the table supporting the same, of the driving-head detachably secured to said shaft, a bearing-sleeve having a flange secured to the table, a collar adjustable on the sleeve, means to adjust the collar, a hollow standard attached to the table, an arm having an angle portion to turn in said standard, and a disk-cup swiveled to the said arm, as set forth.

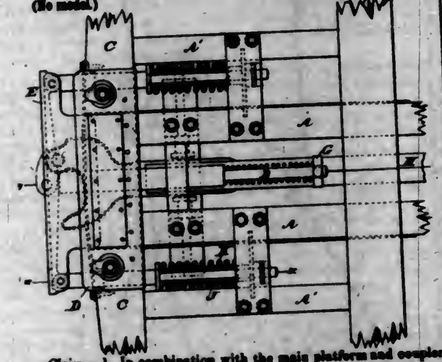
6. The combination with the shaft, the driving-head detachably secured to the shaft and means to drive the shaft, of a fixed sleeve forming a bearing for the shaft, a collar adapted to be adjusted on the sleeve to vary the distance between the driving-head and the collar, and means to adjust the collar, as set forth.

7. The combination with the shaft provided with a reduced shouldered end having a screw-threaded countersink, of a driving-head having a recessed or concaved top, and a bottom adapted to fit over the reduced end against said shoulder, means to drive the shaft, a fixed sleeve forming a bearing for the shaft, and a collar adapted to be adjusted on the sleeve to vary the distance between the driving-head and the collar, and means to adjust the collar, as set forth.

8. The combination with a vertical shaft having a driving-head, and means for operating the shaft, of the hollow standard having a stop projection, an angle-arm operated in said standard against the stop, and the disk-cup rotatably connected to said arm to hold an article of glassware upon the driving-head, as set forth.

9. The combination with the vertical shaft having a driving-head, and means for operating the shaft, of the fixed hollow standard having a portion cut away to form a stop, an angle-arm operated in the standard, a notched spindle secured to the standard, and a disk-cup having a hollow stem provided with a set-bolt engaging said spindle-notch to rotatably connect the cup to the angle-arm, as set forth.

601,899. VESTIBULE-CAR. THOMAS L. MCKEEN, New York, N. Y. Filed Nov. 1, 1897. Serial No. 657,074. (No model.)



Claim.—1. In a vestibule-car, in combination with the buffer-platform, buffer-stems and face-plate E, the rod T, bracket U, spring W, washer V and cotter X, arranged at the top of the car, hood or case M surrounding the rear end of buffer-stem and confining the coil-spring P, cable Z, and eye-bolt R and adjusting-nut S, substantially as and for the purpose set forth.

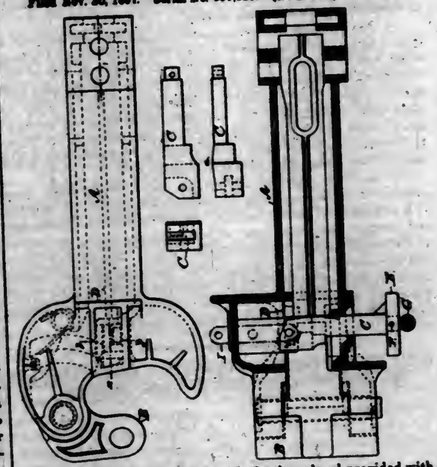
2. The rod T in the upper portion of the vestibule adapted to reciprocate as described, in combination with the bracket U, spring W, washer V and cotter-pin X, whereby the outward movement of the rod T and face-plate is steadied and limited, substantially as hereinbefore set forth.

3. In combination with means at the upper portion of the vestibule for controlling the movement of the upper portion of the face-plate, a hood or case surrounding the rear end of the buffer-stem, a spring confined between the forward end of the hood or case and a follower on the buffer-stem, and a cable having one end attached to the plate-operating means in the top of the vestibule, and the other end adjustably connected to the hood or case surrounding the buffer-stem, substantially as hereinbefore set forth.

601,900. BUFFER-PLATFORM FOR RAILROAD-CARS. THOMAS L. MCKEEN, New York, N. Y. Filed Nov. 1, 1897. Serial No. 657,075. (No model.)

Claim.—1. In combination with the main platform and coupler, and the buffer-platform constructed with a central rear projection or lip M and side teats or pivots O, the central buffer-stem provided with a forwardly-extended lip, and the side buffer-stems with recesses or pockets corresponding with the pivots O, substantially as and for the purpose set forth.

2. In combination with the main platform D, coupler H and buffer-platform E, the central buffer-stem B turned downwardly and then at right angles, the eyebolt G secured to the coupler, and the spring J interposed between the vertical plane of the stem B and the face of the eyebolt G, substantially as and for the purpose set forth.



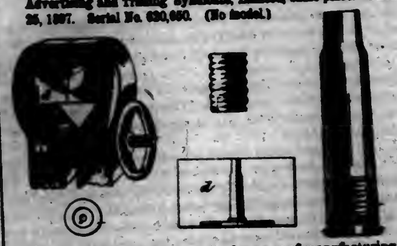
3. In combination with the main platform D, buffer-platform E, coupler H and central buffer-stem B, the side buffer-stems N, the brackets S, braces U and springs W and cotter-pins X, substantially as and for the purpose set forth.

4. In combination with the side sills A, A', side buffer-stems N, and springs R, the brackets S bridging the sills A, A' and braced against the cross-beam V by an intermediate brace-bar U, substantially as and for the purpose set forth.

5. In combination with the side stems N, brackets S, springs R, and cotter-pins X, the pantaloons-springs W, secured to the top plate of the brackets and bearing at their free ends against the vertical arm of the brackets, substantially as shown and described.

6. In combination with the side buffer-stems provided with collars F, and the brackets S formed with the extension-collars T, the coil-springs Q, R, pantaloons-springs W and cotter-pins X, substantially as and for the purposes set forth.

601,901. CAR-COUPLING. THOMAS L. MCKEEN, New York, N. Y. Filed Nov. 20, 1897. Serial No. 659,223. (No model.)



Claim.—1. In combination with the draw-head provided with a comparatively narrow vertical rearwardly-inclined channel, and the knuckle B constructed as described, the gravity locking-block C formed with a thickened upper portion, an attenuated lower portion, and adapted to be placed in operative position through the mouth of the draw-head and retained therein solely by the knuckle B, substantially as and for the purpose set forth.

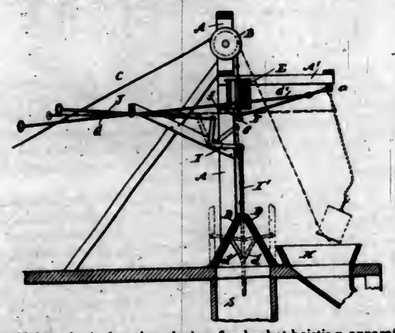
2. In combination with a draw-head having the usual draft inclines resulting from drawing the cores from the boxes, a locking-block C tapered in both directions on one of its sides to correspond with the draft-lines in the draw-head, whereby the natural creeping tendency of the locking-block is prevented as hereinbefore set forth.

3. In combination with the draw-head A and knuckle B, the lock C provided with a removable shoe E, whereby the latter may be removed when assembling the parts, and then secured in position to constitute an extended contact-surface for the lock-lifting device, substantially as described.

601,902. CARTRIDGE-CASE AND PROCESS OF MAKING SAME. FREDERICK W. OLIVER, London, England, assignor to the Publishing, Advertising and Trading Syndicate, Limited, same place. Filed Jan. 26, 1897. Serial No. 620,660. (No model.)

Claim.—1. The herein-described process of manufacturing bodies for cartridge-cases from a waterproof compound composed of a por-

ous material impregnated with celluloid, which consists in first forming a tube of such compound, and then compressing the walls of the tube diametrically while heated to give it the interior and exterior conformation of the finished body.



2. The herein-described process of manufacturing bodies for cartridge-cases from waterproof compound, which consists in first forming a tube of the compound, then compressing the walls of the tube diametrically while heated to give it the interior and exterior conformation of the finished body, and simultaneously by such diametrical pressure molding a screw-thread in one end of the body for the reception of a correspondingly-threaded cap or plug.

3. The herein-described process of manufactering bodies for cartridge-cases from a waterproof compound composed of a porous material impregnated with celluloid, which consists in first forming a tube of such compound, then compressing the walls of the tube diametrically while heated to give it the interior and exterior conformation of the finished body, and simultaneously by such diametrical pressure molding a screw-thread in one end of the body for the reception of a correspondingly-threaded cap or plug.

4. The herein-described process of manufacturing cartridge-cases from a waterproof compound composed of a porous material impregnated with celluloid, which consists in first forming a tube of such compound, then compressing the walls of the tube diametrically while heated to give it the interior and exterior conformation of the finished case, simultaneously by such diametrical pressure molding a screw-thread in one end of the body, and then softening the thread as described and introducing a correspondingly-threaded cap or plug molded from a compound containing celluloid.

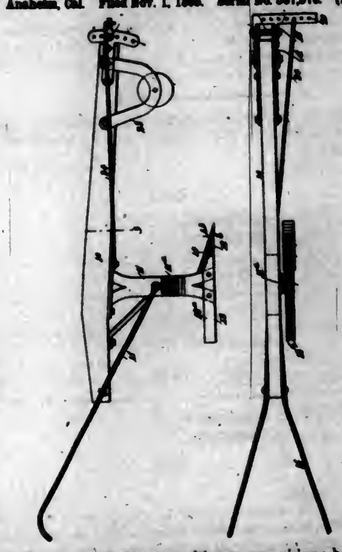
5. As a new article of manufacture, the herein-described homogeneous cartridge-case having an integral waterproof body composed of a compound of porous material and celluloid molded under heat and pressure into shape, open at both ends and having an internal screw-thread molded in one end, and a cap or plug molded from a like compound, having a corresponding screw-thread, and screwed into and integrally united with the threaded end of the body by softening the substance of the plug and the substance of the body to cause their surfaces in contact to weld or intimately unite.

601,903. DUMP FOR ORE-BUCKETS. HECTOR PEPIN, Victor, Colo. Filed Nov. 29, 1897. Serial No. 660,069. (No model.)

Claim.—1. A dumping device for bucket-hoisting apparatus, comprising a bail or knob suspended from the bottom of the bucket by a short chain or similar connector, and a lever pivoted at one side of the bucket and terminating at its outer end in a fork or yoke which narrows at its extremity, said lever being adapted to be swung beneath the bucket when it is raised, and to embrace the knob suspended from the bucket, substantially as described.

2. A dumping device for bucket-hoisting apparatus, comprising a bail or knob suspended from the bottom of the bucket by a short chain or similar connector, a lever pivoted at one side of the bucket and terminating at its outer end in a fork or yoke which narrows at its extremity, said lever being adapted to be swung beneath the bucket when it is raised and to embrace the knob suspended therefrom, and a hand lever connected with said swinging lever, to control it, substantially as described.

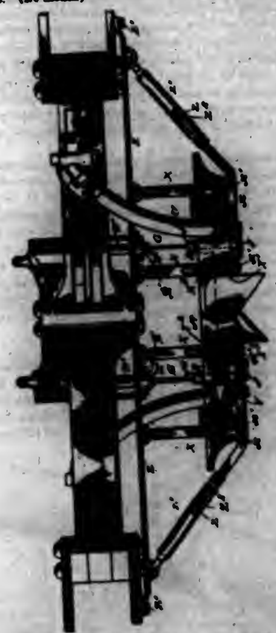
3. A dump for bucket-hoisting devices, comprising a knob suspended from the bottom of the bucket, a lever pivoted at one side of the bucket, having a fork or yoke which narrows to a point at its outer end, said lever being adapted to swing beneath the bucket when it is raised and to embrace the knob suspended therefrom, and a hopper located beneath said lever to receive the contents of the bucket, substantially as described.



4. A dump for bucket-hoisting devices, comprising a ball or knob suspended from the bottom of the bucket, a lever pivoted at one side of the bucket, having a fork or yoke which is narrow at its outer extremity, said lever being adapted to swing beneath the bucket when it is raised and to embrace the knob suspended therefrom, trap-doors hinged at the upper end of the shaft and at opposite sides thereof, and levers by which said doors may be opened or closed, substantially as described.

5. A dump for bucket-hoisting devices, comprising a ball or knob suspended from the bottom of the bucket, a lever pivoted at one side of the bucket, having a fork or yoke which is narrow at its outer extremity, said lever being adapted to swing beneath the bucket when it is raised and to embrace the knob suspended therefrom, trap-doors hinged at the upper end of the shaft and at opposite sides thereof, levers by which said doors may be opened or closed, and a hopper located beneath said swinging lever to receive the contents of the bucket, substantially as described.

6. A dump for bucket-hoisting devices, comprising a ball or knob suspended from the bottom of the bucket, a dumping-lever pivoted at one side of the bucket and having a fork or yoke which at its outer extremity is narrow, said lever being adapted to swing beneath the bucket when it is raised and to embrace the knob suspended therefrom, trap-doors hinged on opposite sides of the shaft and adapted to meet above the shaft to form an A-shaped cover therefor, links pivoted to said doors and to each other to form a toggle-joint, and levers connected to the center of said toggle-joint to operate the doors, substantially as described.



7. A dump for bucket-hoisting devices, comprising a ball or knob suspended from the bottom of the bucket, a dumping-lever pivoted at one side of the bucket and having a fork or yoke which at its outer extremity is narrow, said lever being adapted to swing beneath the bucket when it is raised and to embrace the knob suspended therefrom, trap-doors hinged on opposite sides of the shaft and adapted to meet above the shaft to form an A-shaped cover therefor, links pivoted to said doors and to each other to form a toggle-joint, levers connected to the center of said toggle-joint to operate the doors, and a hopper located beneath said dumping-lever to receive the contents of the bucket, substantially as described.

601,904. MACHINE FOR DIGGING BEETS. LYMAN PIER, Anaheim, Cal. Filed Nov. 1, 1897. Serial No. 657,576. (No model.)

Claim.—A beet digger or cultivator, comprising a beam, a standard bent intermediate its upper and lower ends so as to provide a lower vertical portion located at one side of the vertical plane of the beam and traveling beneath the soil, parallel horizontal plates secured to the opposite sides of the bottom of the standard and extending longitudinally in front and rear thereof, said plates being connected at their forward ends by an inclined and integral connecting-plate, and an inclined point of substantially rectangular shape having plane upper and lower surfaces and straight from its front to its rear edge, said point being bolted to the connecting portion of the parallel plates, substantially as described.

601,905. AUTOMATIC AIR AND STEAM BRAKE COUPLING. WILLIAM J. PUGH, Muscatine, Iowa, assignor to the Walker Automatic Air Coupler Company, Charleston, W. Va. Filed June 20, 1897. Serial No. 642,575. (No model.)

Claim.—1. In an automatic fluid-pressure coupling, the combination of the opposite similar interlocking heads, each having a female portion and a hollow male portion, a jointing-plug in the male portion, springs for moving the jointing-plug outward; an air-passage in the head, a valve in said air-passage; and a rod for operating said valve projecting forward in the female portion and adapted to engage the end of the male portion of the opposite coupling so as to open the valve when the heads interlock, and so as to close the valves when the heads disengage; and means for disengaging said rod from the male portion of the heads after the valve is closed, substantially as and for the purpose described.

2. In an automatic fluid-pressure coupling, the combination of the opposite similar interlocking heads each having a male and female portion substantially as described; an air-passage in the male portion, a jointing-plug in the male portion communicating with said air-passage, a rotary valve in said passage, a hooked rod for turning said valve projecting into the female portion and adapted to engage a hook on the end of the male portion of the opposite coupling; and a bevel for causing the rod to disengage the male portion after the valve is closed, substantially as and for the purpose described.

3. In an automatic fluid-pressure coupling, the combination of the opposite similar interlocking heads, each having a hollow male portion, a jointing-plug in the male portion, springs for moving the jointing-plug outward, a flexible pipe connection between the jointing-plugs and air-passage in the head; a valve in said air-passage; and a rod for operating said valve projecting forward in the female portion and adapted to engage the end of the male portion of the opposite coupling so as to open the valve when the heads interlock, and so as to close the valves when the heads disengage; and means for disengaging said rod from the male portion of the heads after the valve is closed; and means for separating the jointing-plugs laterally, as the heads separate, all substantially as and for the purpose set forth.

4. In an automatic fluid-pressure coupling, the combination of the interlocking heads, the air-passages therein, the valves in said passages, and means for operating said valves substantially as described; with a sliding plate of valve adapted to close the outlet of the air-passage in the heads when they are disconnected to prevent the entrance of dust, &c., substantially as and for the purpose described.

5. In an automatic fluid-pressure coupling the combination of the interlocking heads, each having a male and female portion substantially as described, an air-passage in the male portion, a jointing-plug in the male portion communicating with the air-passage, a valve in said air-passage and means for operating said valve; with a sliding valve or cover for the outlet in the jointing-plug, means for moving it out of the way when the heads are coupled, and for moving it back to place when the heads are disengaged, substantially as described.

6. In an automatic fluid-pressure coupling the combination of the opposite similar interlocking heads, each having a hollow male portion communicating with the air-passage, a valve in said air-passage, a sliding cover for the outlet of the air-passage, and connections between said cover and valve whereby when the valve is opened the cover is withdrawn, substantially as and for the purpose described.

7. In an automatic fluid-pressure coupling, the combination of the interlocking similar heads each having a hollow male portion, a jointing-plug therein communicating with the air-passage in the body of the head, a main valve in said passage, a sliding valve or cover for the outlet of the plug; a sliding rod for operating said main valve having a pin engaging a slotted lug in said cover, whereby when the valve is opened the cover is drawn out of the way, all substantially as and for the purpose set forth.

8. In an automatic fluid-pressure coupling, the combination of the opposite similar interlocking heads each having a male and female portion substantially as described, an air-passage in the male portion, a jointing-plug in the male portion communicating with said air-passage, a rotary valve in said passage, a hooked rod for turning said valve projecting into the female portion and adapted to engage a hook on the end of the male portion of the opposite coupling; and a bevel for causing the rod to disengage the male portion after the valve is closed; with a valve for closing the outlet of the jointing-plug, and connections substantially as described, between said cover-valve and the said rod, all substantially as and for the purpose set forth.

9. In an automatic fluid-pressure coupling, the combination of the head provided with an air-passage, a valve therein a rod for operating said valve adapted to be actuated by the opposite head substantially as described, a spring adapted to open said valve if the heads are pulled apart accidentally, and means substantially as described, for keeping said spring out of action while the parts are in normal condition, for the purpose and substantially as described.

10. In an automatic fluid-pressure coupling, the combination of the head provided with an air-passage, a valve therein, mechanism for opening and closing said valve automatically by the action of the opposite head in coupling and uncoupling; with means substantially as described, for automatically opening said valve if the heads are pulled apart because of accident, substantially as and for the purpose described.

11. In an automatic fluid-pressure coupling, the combination of the head provided with an air-passage, a valve therein, mechanism for opening and closing said valve automatically by the action of the opposite head in coupling and uncoupling; with means substantially as described, for automatically opening said valve if the heads are pulled apart because of accident, and means substantially as described for keeping said means out of operative position when the parts are in normal working condition, for the purpose and substantially as described.

12. In an automatic fluid-pressure coupling, the combination of the opposite similar heads each having a hollow male portion provided with an air-passage, a valve therein, the hooked rod as E for operating said valve adapted to be actuated by the opposite head; a spring H adapted to open said valve should the heads be accidentally pulled apart; a rod F adapted to prevent said spring engaging rod E when the parts are in normal working condition or relation; and a vertically-movable bar *f*, adapted to engage and shift rod F so as to cause it to throw spring H out of operative position when the devices are to be uncoupled in ordinary working, substantially as and for the purpose set forth.

13. In an automatic fluid-pressure coupling, the combination of the coupling-head having an air-passage, a rotary valve therein, a rod as E for operating said valve, a spring H adapted to engage rod E to open said valve; and a rod as F lying beside rod E and adapted to prevent spring H engaging the latter, for the purpose and substantially as described.

14. In an automatic fluid-pressure coupling, the combination of the coupling-head having an air-passage, a rotary valve therein, a rod as E for operating said valve, a spring H adapted to engage rod E to open said valve; and a rod as F lying beside rod E and adapted to prevent spring H engaging the latter; and the beveled bar *f* adapted to shift rod F so as to cause it to control spring H as described; with the locking-pin of the draft draw-bar, the clutch pivoted thereto, and the rod sliding through said clutch and connected to bar *f*, whereby bar *f* is raised with the locking-pin, all substantially as and for the purpose set forth.

15. The combination of the head having hollow male portion A^2, and female portion A', with the spring retracted plug B in part A', a flexible connection between said plug and an air-passage in the body

of the head, the valve D in said air-passage, the plate D' and hooked rod E for operating said valve, all substantially as and for the purpose described.

16. The combination of the head having hollow male portion A^3, and female portion A', with the spring-retracted plug B in part A', a flexible connection between said plug and an air-passage in the body of the head, the valve D in said air-passage, the plate D' and hooked rod E for operating said valve; with the sliding cover-valve c, having lug c' engaged by a pin on rod E, all substantially as and for the purpose described.

17. The combination of the head having hollow male portion A^3, and female portion A', with the spring-retracted plug B in part A', a flexible connection between said plug and an air-passage in the body of the head, the valve D in said air-passage, the plate D' and hooked rod E for operating said valve; with the spring H, the double-beveled rod F for throwing said spring out of engagement with rod E, and means for operating rod F, all substantially as and for the purpose set forth.

18. The combination of the head having hollow male portion A^3, and female portion A', with the spring-retracted plug B in part A', a flexible connection between said plug and an air-passage in the body of the head, the valve D in said air-passage, the plate D' and hooked rod E for operating said valve; with the spring H adapted to engage rod E and close the valve, the spring-actuated double-beveled rod F underlying spring H and adapted to throw it out of engagement with rod E, and means for properly shifting rod F, all substantially as and for the purpose described.

19. The herein-described packing-ring b, having lateral flanges b^2, provided with flaring flange b^3, for the purpose and substantially as described.

20. The herein-described packing-ring b^5, for the purpose described, having lateral flanges b', b^2, at its ends, and a flaring flange b^3 on the edge of flange b^2, substantially as described.

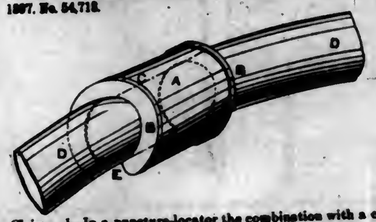
21. The combination of the draw-bar, the plate Z suspended thereunder, the pair of swinging shackles X, X, suspended from said plate, the bars x connecting the shackles, the telescoping plunger and tube connecting bars x to the plate, and the cushioning-spring in the tube; with the fluid-pressure coupling supported in said shackles, and the bolts X' thereon engaging slots X^2 in the front shackle, all substantially as and for the purpose set forth.

22. The combination of the opposite heads A each having a hollow male portion as A^3 and female portion as A' substantially as described; a valve D in the hollow passage in part A^3, an angular plate D' on the valve D, and a spring D^2 pressing against the edge of said plate for throwing and holding the valve fully open or closed, all substantially as described.

23. The combination of the head having hollow male portion A^3, and female portion A', with the spring-retracted plug B in part A', a flexible connection between said plug and an air-passage in the body of the head, the valve D in said air-passage, the plate D' and hooked rod E for operating said valve, and the spring D^2 bearing against the edge of said plate to throw and hold the valve fully open or closed, all substantially as and for the purpose described.

601,906. WATER-MOTOR. ELI A. RUDASILL, Shelby, N. C. Filed June 22, 1897. Serial No. 641,784. (No model.)

Claim.—1. A water-motor, comprising a lever pivoted near its middle, and having buckets pivoted to the ends thereof, water-conveying spouts adapted to deliver water alternately to said buckets, and bars pivoted near one end to each other, and at their other ends respectively pivoted to a fixed point and secured to the bucket, to turn the latter upon its pivot, substantially as described.



2. A water-motor, comprising a lever pivoted near its middle, and having buckets pivoted to the ends thereof, water-conveying spouts carried upon the said lever, extending from said buckets upwardly and toward the center of the motor, a water-delivery pipe discharging into the said conveying-pipes above the lever-pivot, two bars pivoted at one end to each other, and at their other ends respectively connected to a bucket and pivoted to a fixed point, substantially as shown and described.

3. A water-motor comprising a lever pivoted near is middle and having buckets pivoted to the ends thereof, water-conveying pipes adapted to deliver the water alternately to said buckets, and bars adjustably pivoted at one end to each other by means of slots and a pivot-bolt, and at their other ends respectively fixed to a bucket-pivot and pivoted to a fixed point, substantially as described.

4. A water-motor comprising a lever pivoted near its middle and having buckets pivoted to the ends thereof, water conveying spouts adapted to deliver water alternately to said buckets, a segment-gear fixed to the lever at its pivot, a rack mounted to reciprocate and meshing with said gear, and bars pivoted near one end to each other, and at their other ends respectively pivoted to a fixed point and secured to the bucket, to turn the bucket upon its pivot, substantially as described.

5. A water-motor comprising a lever pivoted near its middle and having buckets pivoted to the ends thereof, said buckets being mainly cylindrical but having two tangential faces, one of which is open, water-conveying spouts carried upon said lever, extending from said buckets upwardly and toward the center of the motor, a water-delivery pipe discharging into said conveying-pipes above the lever-pivot, and two bars pivoted at one end to each other and at their other ends connected respectively to the buckets and pivoted to a fixed point, whereby the buckets are adapted to be tipped to empty them at the limit of their downward swing, substantially as described.

601,907. APPLIANCE FOR INDICATING POSITION OF PUNCTURES IN PNEUMATIC TIRES. RICHARD J. SOWDEN, Manchester, England. Filed Dec. 22, 1896. Serial No. 616,693. (No model.) Patented in England June 24, 1896, No. 14,017; in Belgium Dec. 22, 1896, No. 126,294; in Italy Dec. 22, 1896, No. 50,767, and in Canada Jan. 23, 1897. No. 54,718.

Claim.—1. In a puncture-locator the combination with a casing of transparent material adapted to grasp the tire, of end pieces connected to and supporting said casing free of the tire, and a suitable material applied to the transparent surface of the casing and adapted to be displaced by a leakage of air from the tire, substantially as described.

2. An appliance for locating or indicating the position of a puncture or small hole in a pneumatic tube or tire comprising an exterior transparent casing A fitted into horseshoe-shaped ends B with an inner edge to embrace the tube or tire forming a chamber C to contain a light material capable of being displaced by a fine spray or jet of air.

3. In an appliance for locating or indicating the position of a puncture or small hole in a pneumatic tube or tire the combination of the outer transparent casing A provided with a slit or slot E along one side horseshoe shaped ends B into which the transparent casing A is fitted the inner edges of which embrace and fit against the tube or tire D forming a chamber C and fine light material inserted in the chamber to be displaced by a fine spray or jet of air.

601,908. MACHINE FOR GRAINING LUMBER. HUGH SILVER, Lindsay, Canada. Filed Mar. 1, 1897. Serial No. 626,062. (No model.)

Claim.—1. In a machine for graining lumber, a design-roller having its surface formed of a thin sheet of basswood bent around a roller with the fiber running in the direction of the bend, a continuous grain pattern being indented in the surface of the wood, whereby said roller may be rotated several times so as to make no "break" in the grain impression, in combination with a composition printing-roller adapted to revolve in contact with the said design-roller, substantially as and for the purpose specified.

2. In a machine for graining lumber, a design-roller having its surface formed of a thin sheet of basswood bent around a roller with the fiber running in the direction of the bend, a continuous grain pattern being indented in the surface of the wood, whereby said roller may be rotated several times so as to make no "break" in the grain impression, and means for continuously inking the said roller, in combination with a composition printing-roller adapted to revolve in contact with the said design-roller and a pressure-roller adapted to press the lumber against the said printing-roller, substantially as and for the purpose specified.

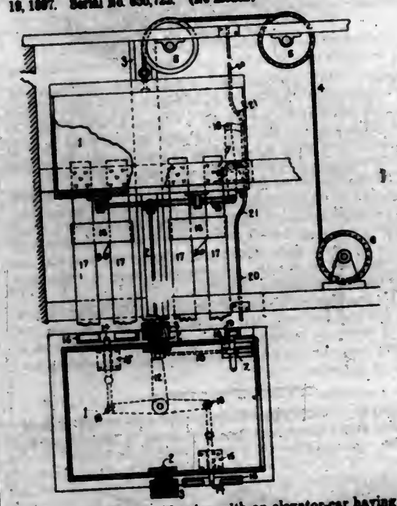
3. In a machine for graining lumber, a design-roller having its surface formed of a thin sheet of basswood bent around a roller with the fiber running in the direction of the bend, a continuous grain pattern being indented in the surface of the wood, whereby said roller may be rotated several times so as to make no "break" in the grain impression, a paint-fount within which the said roller revolves, and a scraper adapted to remove surplus paint from the surface of the roller, in combination with a composition printing-roller adapted to revolve in contact with the said design-roller and a pressure-roller adapted to press the lumber against the said printing-roller, substantially as and for the purpose specified.

4. In a machine for graining lumber, a design-roller having its surface formed of a thin sheet of basswood bent around a roller with the fiber running in the direction of the bend, a continuous grain pattern being indented in the surface of the wood, whereby said roller may be rotated several times so as to make no "break" in the grain impression, a paint-fount within which the said roller revolves, and a scraper adapted to remove surplus paint from the surface of the roller, in combination with a composition printing-roller adapted to revolve in contact with the said design-roller; a pressure-roller adapted to press the lumber against the said printing-roller, and a scraper adapted to remove the pattern from the surface of the printing-roller at a point after it has operated on the lumber and before a fresh impression is received from the design-roller, substantially as and for the purpose specified.

5. In a machine for graining lumber, a design-roller bearing a grain pattern, a paint-fount within which the said roller revolves, and a scraper adapted to remove surplus paint from the surface of the roller, in combination with a composition printing-roller adapted to revolve in contact with the said design-roller; a U-shaped scraper adapted to remove the pattern from the surface of the printing-roller at a point after it has operated on the lumber and before a fresh impression is received from the design-roller; a pressure-roller journaled on arms, each pivoted at one end to the frame of the machine and resting at the other upon an adjustable support, and springs adapted to hold down the said arms, substantially as and for the purpose specified.

6. In a machine for graining lumber, a design-roller bearing a grain pattern and carried in bearings longitudinally adjustable on the frame; a paint-fount within which the said rolleŕ revolves, and a scraper adapted to remove surplus paint from the surface of the roller, in combination with a composition printing roller adapted to revolve in contact with the said design-roller; a U-shaped scraper adapted to remove the pattern from the surface of the printing-roller at a point after it has operated on the lumber and before a fresh impression is received from the design-roller; a pressure-roller journaled on arms, each pivoted at one end to the frame of the machine and resting at the other upon an adjustable support, and springs adapted to hold down the said arms, substantially as and for the purpose specified.

7. In a machine for graining lumber, a design-roller bearing a grain pattern in intaglio, in combination with a flexible-supported scraper having its edge curved in a vertical plane and a strip of flexible material connected thereto, substantially as and for the purpose specified.



8. A frame for a machine of the class described provided with a table B; adjustable bearings E, for a design-roller; bearings c, for a printing, painting or sizing roller; bearings a, for a guide-roller; bearings A, for a rotary brush and the cross-bar O, adapted to carry a brush, substantially as and for the purpose specified.

9. A frame for a machine of the class described, provided with a table B; adjustable bearings E, for a design-roller; bearings c, for a printing, painting or sizing roller; bearings a, for a guide-roller; bearings A, for a rotary brush; the cross-bar O, adapted to carry a brush, and the notched cross-bar F, substantially as and for the purpose specified.

10. A frame or machine of the class described, provided with a table B, adjustable bearings E for a design-roller, bearings c for a printing, painting or sizing roller, bearings a for a guide-roller and fount-supports located below the bearings E and c, substantially as described.

11. A design-roller having its surface formed of a thin sheet of basswood bent around the roller with its grain running in the direction of the bend, a continuous grain pattern being indented in the surface of the wood, substantially as and for the purpose specified.

601,909. ELEVATOR. RUDOLPH C. SMITH, Yonkers, N. Y., assignor of one-half to James Gruickshank, Kingston, N. Y. Filed Oct. 19, 1897. Serial No. 655,723. (No model.)

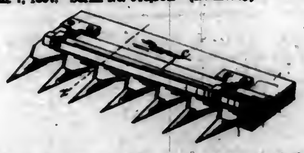
Claim.—1. The combination with an elevator-car having a projecting part, of an elevator-shaft in which said car moves, slideways supported in tension by said elevator-shaft, and the normally stationary clamps on said slideways to be engaged by said projecting part of the car structure, the portion of the slideways below said clamps being proportioned to resist the motion of the clamps and the latter being slidable by abrading the slideways, as described.

2. The combination of an elevator-car having movable dogs with an elevator-shaft in which said car moves, slideways supported in tension by said elevator-shaft, clamps normally stationary on said slideways and in the path of the movable dogs but slidable by abrasion on said slideways, and means to keep the dogs from striking the stop-clamps when the car travels at a safe speed, as described.

3. The combination of an elevator-car having movable dogs, with an elevator-shaft in which said car moves, slideways supported in tension by said elevator-shaft, stop-clamps normally stationary on said slideways, and in the path of the movable dogs, but slidable by abrasion on said slideways, means for keeping the dogs from striking said clamps when the car travels at a safe speed, and a compulsory track for maintaining said dogs in a normally outward position, as described.

4. The elevator-car, the movable dogs carried thereby, and mechanism for operating said dogs, combined with suspended slideways located in the elevator-shaft and arranged in pairs, and the stop-clamps encompassing said slideways and normally stationary thereon, the inner surfaces of said clamps being serrated and said slideways below the normal stationary position for said clamps being of greater cross-section than at said clamps; substantially as set forth.

5. The elevator-car, the movable dogs carried thereby, the lever mechanism for operating said dogs, and the stationary rail for said lever mechanism, the said rail having an outward curve at a definite



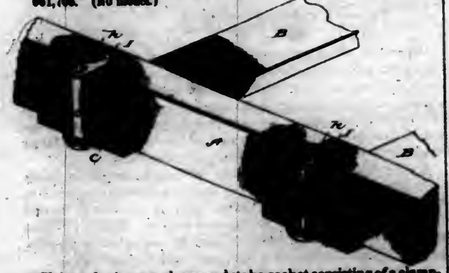
point, combined with the suspended slideways in the elevator-shaft, and stop-clamps on said slideways and in the path of said dogs when the latter are in their normal outward position, said slideways having a greater cross-section below than at said stop-clamps; substantially as set forth.

6. The car having a projecting arm, combined with a vertical slideway suspended in the elevator-shaft, and a stop-clamp on said slideway and normally stationary thereon and in the path of said projecting arm; substantially as set forth.

601,910. PAINT. TAYLOR STEPHENSON, Manning, Iowa. Filed Sept. 7, 1897. Serial No. 650,814. (No specimens.)

Claim.—A paint composed comprising oil, gum-asphaltum, rosin, wax, gum-arabic, shellac, litharge, sulfate of zinc and gum-amber, substantially in the proportions specified.

601,911. MOWING-MACHINE. HENRY R. STERLING, Barton, Ark. Filed Jan. 7, 1897. Serial No. 618,361. (No model.)



Claim.—1. In a machine of the character described, the combination with the cutter-bar, of knives carried thereby, bolts and nuts for securing said knives upon the bar, a locking member adapted to prevent displacement of said nuts, and gripe carried by the frame of the machine for holding the cutter-bar in position, and the locking member in engagement with the nuts, substantially as described.

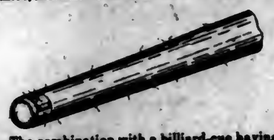
2. In a machine of the character described, the combination with the cutter-bar, of knives carried thereby, bolts and nuts for securing said knives upon the bar, a locking member consisting of a casing adapted to inclose said nuts and prevent their displacement, and gripe carried by the frame of the machine and adapted to retain said casing and cutter-bar in position and permit the same to reciprocate therethrough, substantially as described.

3. The combination with a plurality of nuts, of a casing comprising top, side and end walls and adapted to inclose said nuts, and divided by transverse partitions in compartments of such size as to receive two nuts, whereby the same are prevented from rotating, substantially as described.

601,912. COMBINED FRAME-BRACE AND STAKE-SOCKET. LORENZO STOWE, Chattanooga, Tenn. Filed Dec. 13, 1897. Serial No. 661,702. (No model.)

Claim.—1. A wagon-brace and stake-socket consisting of a clamping member adapted to support and clamp the cross-piece to the side sill or side-board of the wagon-frame, a stake-socket member, and a bolt adapted to connect said members together and to the side sill or side-board, substantially as described.

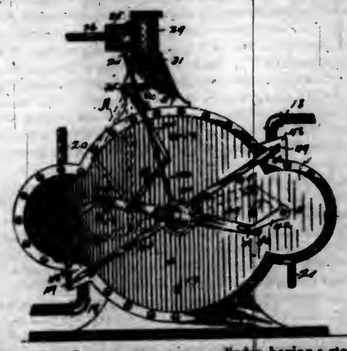
2. A wagon-brace and stake-socket, consisting of a clamping-plate provided with parallel end flanges, a socket member having flanges, and a bolt adapted to be passed through the flanges on the socket member and body of the clamping-plate, substantially as described.



3. A wagon-brace and stake-socket, consisting of a clamping-plate provided with parallel end flanges formed with spurs or projections, a socket member having flanges, and a bolt adapted to be passed through the flanges on the socket member and body of the clamping-plate, substantially as described.

4. A wagon-brace and stake-socket, consisting of a clamping-plate provided with a bolt-hole and parallel end flanges having lugs or projections, a vertical socket member provided with top and bottom flanges having alined bolt-holes, and a bolt adapted to be passed through the said holes in the socket-flanges and clamping-plate, substantially as described.

5. A wagon-brace and stake-socket, consisting of a cross-piece clamp provided with parallel end flanges each having a lug or projection, a socket member, and a bolt adapted to connect the said clamp and socket member.

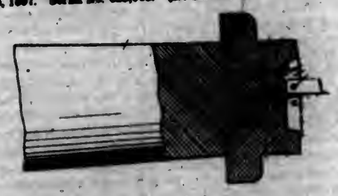


6. In a wagon, the combination with a side sill or board and bottom cross-piece, of a clamping-plate supporting the end of the cross-piece and provided with end flanges engaging the side edges of said cross-piece and having lugs or projections entering recesses in the under side of the side sill or board, a vertical socket member on the exterior of said sill or board and provided with flanges lapping over upon the top and bottom edges of the same, and a bolt extending through the side sill or board, socket-flanges and body of the clamping-plate and connecting said parts together, substantially as described.

601,918. TIP-FASTENER FOR BILLIARD-CUES. PEYTON B. TARVIN, Ardmore, Ind. Ter. Filed May 21, 1897. Serial No. 637,637. (No model.)

Claim.—The combination with a billiard-cue having longitudinal cavities ending in a reduced portion, and a cue-tip having a peripheral groove and a neck of equal diameter to said reduced portion, of means for fastening the tip to the cue comprising two separate arms each being secured in the said cavities, and having movable ends, and a set-screw passing through the movable ends and through the cue, said movable ends being tapered and provided with lateral wings to hug the tip-neck and said reduced portion, one edge of the wings bearing against a shoulder of the cue and the other end forming a bearing for the tip, and having a lip to engage the said tip-groove, as set forth.

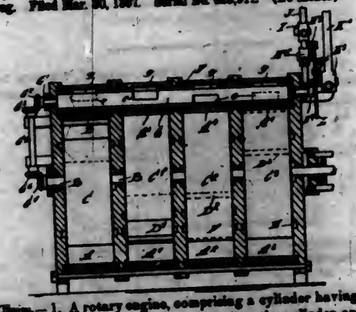
601,914. ROTARY ENGINE. WILLIAM D. THOMAS, Allegheny, Pa. Filed Apr. 12, 1897. Serial No. 631,864. (No model.)



Claim.—1. In a rotary motor, a cylinder having a steam chest provided with inlet-valves, a power-wheel mounted upon a driving-shaft, rocker-valves mounted within said cylinder, a steam-chest and cylinder, arranged above the main cylinder, and eccentric connections from the driving-shaft to the inlet-valves and to the steam-chest above the main cylinder whereby the inlet-valves are automatically opened and closed, a beam swiveled to the cylinder-head, the ends of said beam being pivotally secured to the rocker-lever and crank-arms, connections between the piston operating in the cylinder above the main cylinder and the said beam, whereby said rocker-valve is made to perform two operations at one stroke of the piston, and permit the uninterrupted movement of the power-wheel, substantially as shown and described.

2. In a rotary motor, a cylinder, a power-wheel mounted upon a driving-shaft in said cylinder, said power-wheel having abutments, rocker-arms mounted in the cylinder, a steam-chest and cylinder arranged above the main cylinder, a piston operating in said cylinder, a beam swiveled on the cylinder-head, the ends of said beam being pivotally secured to the rocker-lever and crank-arms, connections between said piston and the said beam, whereby said rocker-arms are permitted to perform two complete operations at one stroke of the piston, a ring or plate secured to the cylinder-head, a steam-chest and inlet-valves for said main cylinder, and eccentric connections from the driving-shaft with the inlet-valves, and the valves controlling the steam-chest above the main cylinder whereby the inlet-ports are automatically opened and closed, and the rocker-arms are operated so as to permit the uninterrupted movement of the power-wheel, substantially as shown and described.

3. In a rotary motor, a cylinder, having a steam-chest provided with inlet-valves, a power-wheel mounted upon a driving-shaft, rocker-valves mounted within said cylinder, a steam-chest and cylinder arranged above the main cylinder, and eccentric connections from the driving-shaft to the inlet-valves and to the steam-chest above the main cylinder, whereby the inlet-valves are automatically opened and closed and the rocker-valves operated to permit the uninterrupted movement of the power-wheel, substantially as shown and described.



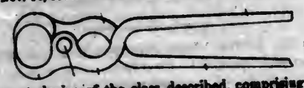
4. In a rotary motor, a cylinder and a power-wheel mounted upon a driving-shaft in said cylinder, said power-wheel having abutments, rocker-valves mounted in the cylinder, a steam-chest and cylinder arranged above the main cylinder, a ring or plate secured to the cylinder-heads, a steam-chest and inlet-valves for said main cylinder, and eccentric connections from the driving-shaft with the inlet-valves and the valve controlling the steam-chest above the main cylinder, whereby the inlet-ports are automatically opened and closed, and the rocker-arms are operated so as to permit the uninterrupted movement of the power-wheel, substantially as shown and described.

601,915. NUT-LOCK. JOHN B. TOWNSEND, Denver, Colo. Filed Mar. 5, 1897. Serial No. 626,963. (No model.)

Claim.—The combination with a threaded object, and a nut designed to fit thereon, of a pair of dogs pivotally mounted in a diametrical groove in the extremity of said object and projecting radially beyond the outer threaded surface thereof, said dogs being adapted to fold entirely within the plane of the nut, the nut having in its outer face oppositely-located notches terminating short of the outer edges of the same and adapted to receive said dogs wholly within the plane of the nut, and means for holding said dogs in either their operative or inoperative positions, substantially as described.

601,916. ROTARY ENGINE. CLARENCE W. TRIPLETT, Leland, Oreg. Filed Mar. 20, 1897. Serial No. 628,911. (No model.)

Claim.—1. A rotary engine, comprising a cylinder having an internal offset provided with ports leading into the cylinder and with ports each connected with a pipe leading to a valve controlling the admission of the motive agent, a piston arranged concentric in the cylinder and having its peripheral face in contact with the offset at or near the middle thereof, piston-heads fitted to slide in the piston, a hollow reversing-valve mounted in the offset and provided with oppositely-arranged pairs of ports, a revoluble valve in the reversing-valve and provided with a port in its periphery, means for operating said revoluble valve from the shaft of the piston and means for simultaneously operating the reversing-valve and the valve controlling the admission of the motive agent, substantially as described.



2. A rotary engine, comprising a cylinder having an internal offset containing the ports *a*, *b*, *h*, *i*, a piston arranged concentric in the cylinder and having its peripheral surface in contact with the said offset, piston-heads mounted to slide in the piston, a hollow reversing-valve mounted in the offset of the cylinder and provided with oppositely-arranged ports *c*, *f*, *d*, *g*, a revoluble valve in the reversing-valve and operated from the piston-shaft, said valve being provided with a port *e* in its periphery, substantially as described.

3. A rotary engine, comprising a series of cylinders, each having an internal offset containing the ports *a*, *b*, *h*, *i*, pistons arranged in the said cylinders and having their peripheral surfaces in contact with the said offsets, piston-heads fitted to slide in the piston and set at quarter-turns relatively one to the other, the hollow reversing-valve F having ports *e f d g*, and the revoluble valve G mounted in the valve F and driven from the piston-shaft, said valve being provided with peripheral ports set in quarter-circle, substantially as described.

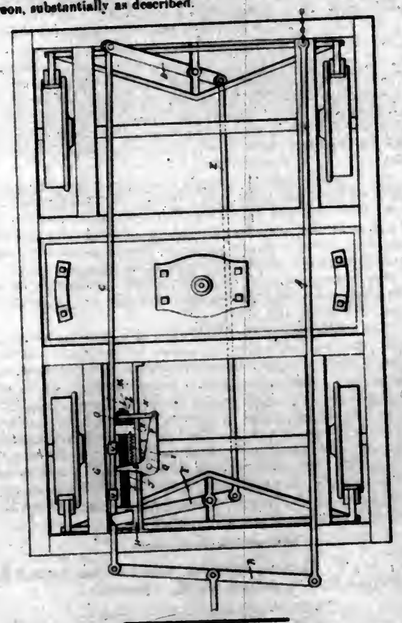
4. In a rotary engine, the combination with a cylinder having an internal offset provided with ports, a piston in the cylinder and having its periphery in contact with the offset, piston-heads extending in the piston, a hollow reversing-valve, and a revoluble valve mounted in the reversing-valve, of a branch supply-pipe connected with ports in the offset, a valve in said supply-pipe, an exhaust-pipe, a valve in the exhaust-pipe, and means for simultaneously operating the valves in the supply and exhaust pipes and the reversing-valve, substantially as described.

5. In a rotary engine, the combination with a cylinder having an internal offset provided with ports, a piston in the cylinder and having its periphery in contact with the said offset, piston-heads sliding in the piston, a hollow reversing-valve, and a revoluble valve in the reversing-valve, of the supply-pipe J, the valve I therein, pipes N N′ leading from the supply-pipe to ports in the offset of the cylinder, the valve H^2 connected with the valve I, the pipes H H′ leading from ports in the offset to valve H^2, exhaust-pipes K K′ connected with the ports with which the pipes H H′ are connected, the valve-casing K^2 with which the pipes K K′ connect, the valve K^2 in the said casing and means for simultaneously operating the valves F, H^2 and K^2, substantially as herein shown and described.

601,917. FARRIER'S PINCERS. HUBERT WAGNER, Buffalo, N. D. Filed Nov. 16, 1897. Serial No. 658,726. (No model.)

Claim.—A device of the class described, comprising a pair of curved jaws pivotally connected with each other, and handles crossing each other at the back of the jaw-pivot and laterally bent to pass by each other, the handles being curved adjacent to the pivot to conform to the curvature of the jaws for receiving the same when the jaws are open, substantially as shown and described.

601,918. SLACK-ADJUSTER FOR BRAKE-GEAR. GUY H. WATERS, New Haven, Conn. Filed Oct. 25, 1897. Serial No. 656,378. (No model.)



Claim.—1. In combination with brake mechanism including a dead-lever and a top rod, of a block to which the inner end of said dead-lever is secured a screw-shaft upon which said block is mounted, and connections between said top rod and screw-shaft, whereby movement of the top rod imparts movement to said shaft, and so as to adjust the position of the inner end of said dead-lever, substantially as described.

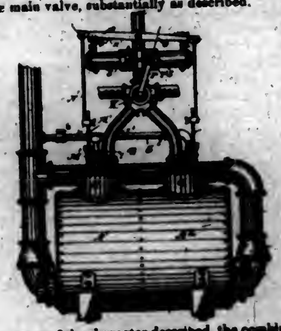
2. In combination with brake mechanism including a dead-lever and a top rod, of a block to which the inner end of said dead-lever is secured, a screw-shaft upon which said block is mounted, a bell-crank lever adapted to be turned by the movement of said top rod, and connections between said top rod, bell-crank lever and screw-shaft whereby movement of the top rod imparts movement to said shaft, and so as to adjust the position of the inner end of said dead-lever, substantially as described.

3. In combination with brake mechanism comprising a dead-lever and a top rod, of a slack-adjuster consisting of a block to which the inner end of said dead-lever is secured, a screw-shaft upon which said block is mounted for transverse movement, a ratchet on the outer end of said screw-shaft, a pawl mounted for engagement with said ratchet, and a bell-crank lever engaged with said pawl and adapted to be turned by the movement of said top rod, substantially as described.

4. A slack-adjuster for brake-gear, consisting of guideways, a block mounted between said ways upon a screw-shaft, a ratchet fixed to the outer end of said screw-shaft, an arm also mounted on said

shaft and carrying a pawl, the nose of which engages with the teeth of said ratchet, a link connected with the outer end of said arm and with one arm of a bell-crank lever mounted upon a pivot above said screw-shaft the other arm of said lever extending over said screw-shaft, and so that movement imparted to said bell-crank lever in one direction will revolve said screw-shaft and thereby move the block thereon, substantially as described.

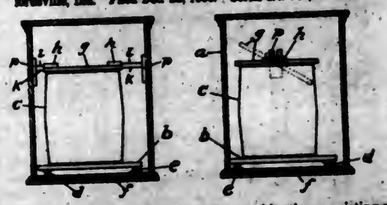
601,919. BOTTLE. HENRY WEIL, New York, N. Y. Filed Aug. 10, 1897. Serial No. 647,751. (No model.)



Claim.—1. A bottle, having a valve-seat in its neck portion, a valve for engaging therein, a bar extended through a hole at one side of the neck, a socket extended through a hole at the opposite side of the neck, a locking device engaging the bar with the socket, and a guard above the bar, substantially as specified.

2. In a bottle, the combination with a valve in the neck thereof, of a cross-bar extended through a hole at one side of the neck, a head on the outer end of the bar, a socket extended through a hole at the opposite side of the neck and receiving the end of the rod, a spring-dog carried by the rod and having locking engagement with the socket, and a head on the outer end of the socket, substantially as specified.

601,920. PUMP. MILO L. G. WHEELER, North Yakima, Wash. Filed June 1, 1897. Serial No. 638,948. (No model.)



Claim.—1. In a pump of the character described, the combination of two liquid-compartments, inlets and outlets therefor, a pipe communicating with the source of pressure and with each of said compartments, exhausts in communication with said pipes, a valve controlling the communication between the supply-pipe and compartments and with the exhaust, cylinders, pistons movable therein, said pistons being connected to operate in unison, pipes communicating with the cylinders and the pressure-supply pipe, exhausts for said cylinders, valves controlling the communication between the pipes and the exhausts and the supply-pipe, arms secured to said valves, tubular guides extending within the compartments, rods movable in said guides, an interfhediately-pivoted lever to which the rods are pivoted, a connection between the respective ends of the lever and the arms of the valves, stops carried by said rods at their lower ends, floats within the compartments and movable upon said tubular guide, said floats adapted to alternately engage the stops of the rods for the purpose described, and an operative connection between the pistons and the main valve, substantially as described.

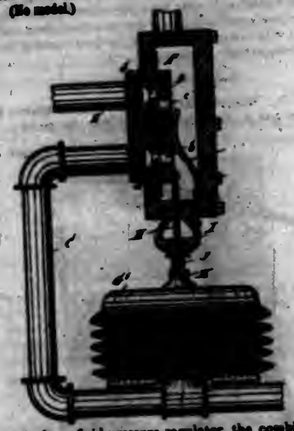
2. In a pump of the character described, the combination of two tanks adapted to contain the liquid to be pumped, a pipe communicating with a source of pressure, pipes communicating with the supply-pipe and the tanks, exhausts for said pipe, a valve controlling the communication between said pipes and the supply-pipe and the exhausts, cylinders positioned upon said supply-pipe, pistons movable in said cylinders, a piston-rod connecting said pistons, an arm secured at one end to the valve and engaging the piston-rod at its opposite end, pipes communicating with the supply-pipe and said cylinders, exhaust-ports for said pipes, valves within said pipes for controlling the communication between the same and the supply-pipe and the exhausts, tubular guides positioned within the tanks, rods movable within the guides, an intermediately-pivoted lever to the opposite ends of which the rods are connected, operative connections between said levers and the cylinder-valves, floats within the tanks movable upon the tubular guide and adapted to engage the rods to operate the same, and an outlet and inlet for said tanks, substantially as described.

3. In a pump, the combination of two liquid-compartments, inlets and outlets therefor, a pipe communicating with the source of pressure and with each of said compartments, exhausts in communication with said pipes, a valve controlling the communication between the supply-pipe and compartments, cylinders, pistons therein, pipes communicating with the cylinders and the pressure-supply pipe, exhausts for said cylinders, valves controlling the communication between the pipes and the exhausts and the supply-pipe, arms on said valves, rods movable in said compartments, a lever to which the rods are connected, connections between the ends of the lever and the arms of the valves, stops carried by said rods at their lower ends, floats within the compartments adapted to alternately engage the stops on the rods, and an operative connection between the pistons and the main valve, substantially as described.

601,921. GROCER'S CABINET. ROBERT H. WHITTED, Crawfordsville, Ind. Filed Dec. 28, 1896. Serial No. 616,726. (No model.)

Claim.—In a grocer's cabinet, the combination consisting of the door *a* having a quadrant shelf *b* rigidly fixed to the inner side thereof; rollers *d* and *e* supporting and facilitating the swinging of the shelf *b* out and in; the tilting cover *g*, standing normally in an inclined position and adapted to automatically assume a horizontal position as cover of a vessel *c* swung underneath thereof when standing upon the swinging shelf *b*; and the parts *k*, *l*, *p* and *h*; all used in combination and substantially as, and for the purposes set forth.

601,922. POCKET-BOOK. GEORGE A. WHELAND, Duluth, Minn. Filed Oct. 7, 1897. Serial No. 654,441. (No model.)



Claim.—1. As a new article of manufacture, a pocket-book formed of stiff paper, the said paper being folded twice, the said pocket-book comprising an inner and an outer sheet connected with each other at one end edge only and forming two outer pockets and an intermediate or central space or pocket, the sheets maintaining their shape and their folded position by the stiffness of the material, the outer pockets being open at the front and one end and closed at the opposite end, the central space or pocket being open at both ends and the front, and binding secured over the creased portion to receive the same and serve as a hinge, substantially as described.

2. As a new article of manufacture, an advertising pocket-book formed of stiff paper adapted to receive advertisements, the said paper being scored so as to enable it to be folded twice, the said pocket-book comprising an inner and an outer sheet connected with each other at one edge only and forming two outer pockets and an intermediate or central space or pocket, the sheets maintaining their shape and their folded position by the stiffness of the material, the outer pockets being open at the front and one end and closed at the opposite end, the central space or pocket being open at both ends and the front, and binding secured over the creased portion to receive the same and serve as a hinge, and the outer corners of the several layers of the pocket-book at the end where the pockets are open being rounded, substantially as described.

3. As an improved article of manufacture, a pocket-book formed of stiff paper or other material comprising in its construction an inner and an outer sheet connected with each other at one edge only, and another sheet secured to the first sheet along one edge only so that when the sheets are folded, as described, two outer pockets closed at bottom and open at the top and ends, and an inner space open at top, bottom and front and closed at rear, are secured, substantially as described.

601,923. FLUID-PRESSURE REGULATOR. JESSE WILLIAMS and JOSEPH B. RAMS, Pueblo, Colo. Filed May 19, 1897. Serial No. 637,217. (No model.)

Claim.—1. In a fluid-pressure regulator, the combination of a chest having an inlet and an outlet orifice, and having a valve-seat formed around the outlet-orifice, a slide-valve mounted on the seat and commanding the outlet-orifice, a spring attached to the interior of the chest and pressing the slide-valve against the seat, a rod attached to the slide-valve, a spring actuating the rod, and a bellows in connection with the rod whereby to actuate the same.

2. In a fluid-pressure regulator, the combination of a chest having an inlet and an outlet orifice, the chest having a valve-seat formed around the outlet-orifice, a slide-valve mounted on the valve-seat and commanding the outlet-orifice, a spring attached to the interior of the chest and pressing the slide-valve against the seat, a rod attached to the slide-valve and moving through a gland in the chest, and means for actuating the rod whereby to move the slide-valve.

3. In a fluid-pressure regulator, the combination of a chest having an inlet and an outlet orifice, the chest having a valve-seat formed around the outlet-orifice, a slide-valve moving on the valve-seat and commanding the outlet-orifice, a spring attached to the interior of the chest and pressing the slide-valve on the seat, a rod attached to the slide-valve, a packing-gland in one wall of the chest through which gland the rod reciprocates, a bellows in connection with the rod and having communication with the outlet-orifice of the chest, and an expansive spring surrounding the rod and bearing against the bellows and against the packing-gland.

4. In a fluid-pressure regulator, the combination of a chest having an inlet and an outlet orifice therein, a slide-valve commanding one of the orifices, a rod attached to the slide-valve, a packing-gland in one wall of the chest through which gland the rod reciprocates, a bellows attached to the rod and having communication with the orifice commanded by the valve, and an expansive spring surrounding the rod and bearing against the gland and bellows.

601,924. TOY OR PUZZLE. ROBERT WILSON, Newark, N. J., assignor, by mesne assignments, to the Aladdin Lamp Company, of New Jersey. Filed May 4, 1897. Serial No. 634,998. (No model.)

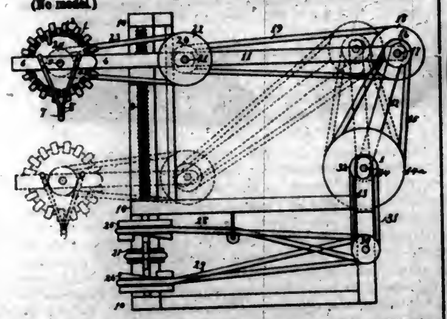
Claim.—1. A toy or puzzle comprising a suitable box or case, having angularly-arranged sides and a base all tapering toward the ends of the box, to form at or near the middle of the box, a portion a^3 which is wider than the remaining parts of the box, and said base having differently-colored portions, and balls or marbles in said box, consisting, of a single ball or marble of a color different from the colored portions of the box or case, and two sets of balls or marbles of colors corresponding to said colored portions of the box or case, said smaller balls or marbles being adapted to pass the larger ball or marble only at the center of the box, substantially as and for the purposes set forth.

2. A toy or puzzle comprising a suitable box or case, having angularly-arranged sides and a base all tapering toward the ends of the box, to form at or near the middle of the box, a portion a^3 which is wider than the remaining parts of the box, and said base having differently-colored portions, and balls or marbles in said box, consisting, of a single ball or marble of a color different from the colored portions of the box or case, and two sets of balls or marbles of colors corresponding to said colored portions of the box or case, said sets of balls or marbles all being of the same size, and said single ball or marble being of a larger size, said smaller balls or marbles being adapted to pass the larger ball or marble only at the center of the box, substantially as and for the purposes set forth.

3. A toy or puzzle comprising a suitable box or case, having a base and sides a^4 tapering toward its ends, said base and sides having differently-colored portions a^2 and a^4, and balls or marbles movable in said box, consisting, of a single ball or marble of a color different from the colored portions of the box or case, and two sets of balls or marbles of colors corresponding to said colored portions of the box or case, substantially as and for the purposes set forth.

4. A toy or puzzle comprising a suitable box or case, having a base and sides a^4 tapering toward its ends, said base and sides having differently-colored portions a^2 and a^4, and balls or marbles movable in said box, consisting, of a single ball or marble of a color different from the colored portions of the box or case, and two sets of balls or marbles of colors corresponding to said colored portions of the box or case, said sets of balls or marbles all being of the same size, and said single ball or marble being of a larger size, substantially as and for the purposes set forth.

5. A toy or puzzle comprising a suitable box or case, having angularly-arranged sides and a base all tapering toward the ends of the box, to form at or near the middle of the box, a portion a^3 which is wider than the remaining parts of the box, and said balls or marbles movable in said box, consisting, of a large ball or marble *b*, and differently-colored sets of smaller balls or marbles *c* and *c'*, said smaller balls or marbles being adapted to pass the larger ball or marble only at the center of the box, substantially as and for the purposes set forth.



6. A toy or puzzle, comprising a suitable box or case, having a base and sides a^4 tapering toward its ends, and balls or marbles movable in said box, consisting of a large ball or marble *b*, and differently-colored sets of smaller balls or marbles *c* and *c'*, substantially as and for the purposes set forth.

601,925. JOINT FOR RIMS OF VEHICLE-WHEELS. GEORGE L. WILSON, Plymouth, Ind. Filed Nov. 8, 1897. Serial No. 657,703. (No model.)

Claim.—A joint for the rims of vehicle-wheels or for other purposes, the meeting ends of sections thereof formed with a tongue having the three angles *b c d* and the shoulder *i*, and the notched seat having the angles *f g h* with which the tongue of the adjacent section engages as shown, and a flat-sided tapering key inserted between the tongues, substantially as and for the purpose set forth.

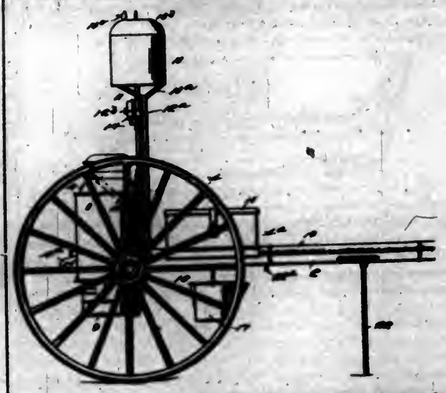
601,926. MACHINE FOR SPLITTING BEEVES. HARLAND H. YOUPE, Kansas City, Mo., assignor of two-thirds to John W. Smith and Wallace G. Tower, same place. Filed July 9, 1897. Serial No. 643,970. (No model.)

Claim.—1. In a machine for splitting beeves, the combination with a suitable frame, an arm having a vertical travel on said frame, and means for operating said arm, of a series of revolving cleavers mounted on a shaft journaled on said arm, a bifurcated guide-pin carried on said arm arranged to follow the spinal cord of a carcass suspended under said arm, and means for revolving said cleavers: substantially as set forth.

2. In a machine for splitting beeves, the combination with a suitable frame, a screw mounted vertically upon said frame and means for giving direct and reverse motion to said screw; of an arm arranged to travel on said screw, a series of revolving cleavers mounted on a shaft journaled on said arm, a bifurcated guide-pin carried on said arm arranged to follow the spinal cord of a carcass suspended under said arm, and means for revolving said cleavers; substantially as set forth.

3. In a machine for splitting beeves, the combination with a series of cleavers mounted upon a revolving shaft and an arm upon which said shaft is journaled, of a bifurcated guide-pin carried on said arm and arranged to operate in advance of said cleavers; substantially as set forth.

4. In a machine for splitting beeves, the combination with a suitable frame and an arm arranged to travel vertically in said frame, of a bifurcated guide-finger carried on said arm and arranged to follow the spinal cord of the carcass suspended under said arm; substantially as set forth.



601,927. ENAMELED PAPER AND COMPOUND USED TO ENAMEL SAME. FREDERICK G. ANSHUS, London, England, assignor to the Publishing, Advertising and Trading Syndicate, Limited, same place. Filed Sept. 10, 1897. Serial No. 651,249. (No specimens.)

Claim.—1. As a new article of manufacture, the herein-described enameled paper, the enameled surface of which is adapted to receive and retain printing and lithographic impressions, which enameled surface consists of a nitrocellulose compound of the character described and pigment, the proportion of the latter to the composition being larger than, or in excess of the proportion of the nitrocellulose compound for the purpose set forth.

2. As a new article of manufacture, the herein-described enameled paper, the enameled surface of which is adapted to receive and retain printing and lithographic impressions, which enameled surface consists of a nitrocellulose compound of the character described containing oil and pigment, the proportion of the latter to the composition being larger than, or in excess of the proportion of the nitrocellulose compound for the purpose set forth.

3. A composition of matter to be used as an enamel adapted to receive printing and lithographic impressions, consisting of a nitrocellulose compound of the character described and a pigment, the proportion of the latter to the composition being larger than or in excess of the proportion of the nitrocellulose compound, substantially as described.

601,928. REFRESHMENT-CART. CLIFTON S. ARNOLD, Sing Sing, N. Y. Filed Mar. 30, 1897. Serial No. 629,906. (No model.)

Claim.—1. The combination in a refreshment-cart, with the axle and pole thereof, of the body portion composed of two metallic plates having their forward ends attached to the pole, thence bent outwardly at substantially right angles thereto in opposite directions and inclining toward the ends of the axle, and thence inwardly in loop form with their ends attached to said axle near its center, thereby forming loop-supports for the vessels, substantially as shown and described.

2. In a refreshment-cart, the combination with the axle and pole thereof, of the body portion composed of two metallic plates or straps set on edge and having their forward ends attached to the pole, thence bent outwardly in opposite directions and rearwardly toward the ends of the axle and thence inwardly with their rear ends bent in loop form and attached to said axle near its center, thereby forming loop-supports for the vessels, said axle being bent into crank form and provided near its ends with inwardly-extending portions forming bearings for said plates, substantially as described

601,929. WIRE-SPLICING PLIERS. ROBERT BRATT, Tarentum, Pa. Filed Aug. 4, 1897. Serial No. 647,054. (No model.)

Claim.—As a new article of manufacture, the pliers as herein described, consisting of two parts interlocked, one operating within the other and each part carrying a jaw which is provided with corrugations, one of said jaws being provided with a groove near the upper edge of the same and extending transversely thereof, the opposite jaw being provided at one side with a projection having a longitudinal inclined groove opening outwardly from the jaw, and a spring arranged between the handles to keep the jaws normally apart, substantially as shown and described.

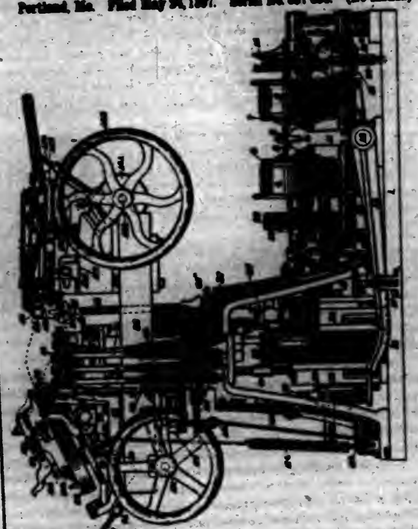
601,930. ADJUSTABLE HANGER FOR INCANDESCENT LIGHTS. FRED C. BELL, Coeur d'Alene, Idaho, assignor, by direct and mesne assignments, to H. G. Paul, same place. Filed Mar. 20, 1896. Serial No. 583,215. (No model.)

Claim.—1. The combination with the rotatable drum, having a hook on its periphery, and the pivoted dogs and the pins on the inside of one of the heads thereof, of the spindle the notched disk fixed thereto, the hub secured to said spindle, the radial arms secured to said hub having quadrangular loops at the outer ends, the rollers journaled to said loops and lying in different planes from said arms, and the rope engaging with said hook and wound around the drum and its ends passed through said loops and bearing against said rollers, substantially as described.

2. The combination with the rotatable drum having a hook on its periphery, and the pivoted dogs and pins on the inside of one of the heads thereof, of the spindle the flaring shield secured thereto, the notched disk secured to said spindle with which the said dogs engage, the hub secured to said spindle, the radial arms having quadrangular loops at the outer ends, the rollers journaled thereto in different planes and the cord connected with said hook and wound around the drum and its ends passed through said loops and bearing against said rollers, substantially as described.

601,931. COMPRESSED-MEAT CAN. JESSE L. BLAIR, Prospect, Ohio. Filed Aug. 23, 1897. Serial No. 649,209. (No model.)

Claim.—A can or casing for containing and compressing meats, comprising two semicylindrical sections pivoted to open and close, a cover for one end of the can, and a follower-cap for the opposite end of the can comprising a casing movable in the can and having a perforated bottom, apertured walls, and a circumferential flange to engage the upper edge of the can, substantially as described.



601,932. CUTTER-HEAD. GEORGE R. BOYD, Cairo, Ill., assignor of three-fourths to Charles S. Carey and Ernest Lemon, same place. Filed Sept. 7, 1897. Serial No. 650,777. (No model.)

Claim.—1. A cutter-head having a cylindrical body portion having longitudinal grooves in its periphery, each groove having arc-shaped surfaces running outward and disposed tangentially to the body portion, cutters arranged respectively in the grooves and lying snugly against the arc-shaped surfaces thereof, the cutters projecting beyond the body portion and having transversely elongate slots therein, keys laid respectively on the cutters, and screws passed through the keys and through the slots of the cutters, the grooves engaging screw-holes in the body portion and the body portion having a plurality of holes for each screw so that the cutters and grooves may be adjusted.

2. A cutter-head having a body portion with a groove therein, the groove having an arc-shaped surface, an arc-shaped cutter laid in said groove and adjustable transversely therein, a key curved to conform to the cutter and having at one side an outwardly-extending flange and the opposite side being cut out, and a bolt passed through the key and cutter and engaging the body portion.

601,933. LASTING-MACHINE. MATTHIAS BRUCE, Boston, Mass., assignor to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed May 24, 1897. Serial No. 637,893. (No model.)

Claim.—1. A machine for lasting boots and shoes, containing toe, heel and side lasting mechanisms, and a support for the last carrying the shoe to be lasted, all constructed and arranged to permit said last and said toe and heel lasting mechanisms to be relatively and automatically moved to bring the respective lines of action of said toe and heel lasting mechanisms into substantial correspondence with the line of direction in which the toe and heel portions of the last respectively face, substantially as described.

2. A machine for lasting boots and shoes containing toe and heel lasting mechanisms, and a support for the last carrying the shoe to be lasted, all constructed and arranged to permit said last and said toe and heel lasting mechanisms to be relatively and automatically moved to bring the respective lines of action of said toe and heel lasting mechanisms into substantial correspondence with the line of direction in which the toe and heel portions of the last respectively face, substantially as described.

3. A lasting-machine for use in lasting boots and shoes, containing a support for the last and end lasting mechanism, constructed and arranged to permit relative and automatic movement of said last and end lasting mechanism to enable the latter to act in a direction corresponding to the direction in which the end of the last faces, substantially as described.

4. A machine for lasting boots and shoes, containing manually-operated end lasting mechanism, an operating-handle for the said end lasting mechanism, a support for the last and the shoe thereupon, and means whereby movement of said operating-handle acts first and automatically to aline said end lasting mechanism and the end of the last, and thereafter to lay the material of the shoe over and upon said last.

5. A machine for lasting boots and shoes, containing a support for the last with the shoe thereupon, and end lasting mechanism with a clasp adapted to embrace the end of the last and the material thereupon, and means whereby said clasp on meeting and adapting itself

to the alinement of the end of the last, acts automatically to move said end lasting mechanism also into alinement with said end of the last.

6. A machine for lasting boots and shoes containing end lasting mechanisms, and a support for the last carrying the shoe to be lasted all constructed and arranged to permit said last and said end lasting mechanism to be relatively and automatically moved by said last to bring the alinement of said end lasting mechanisms and the ends of said last into substantial correspondence.

7. A machine for lasting boots and shoes, containing a support for the last carrying the shoe to be lasted, toe, heel and side lasting mechanisms, means to move said toe and heel lasting mechanisms one toward and from the other and with relation to said side lasting mechanisms, said last support and said toe and heel lasting mechanisms being constructed and arranged to relatively and automatically move to bring said toe and heel lasting mechanisms into substantial alinement with the ends of said last.

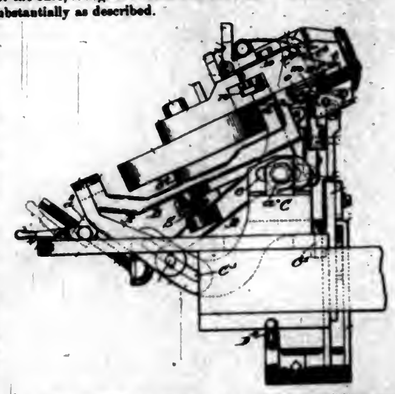
8. A machine for lasting boots and shoes containing a support for the last carrying the shoe to be lasted, toe, heel and side lasting mechanisms, said last-support and said toe and heel lasting mechanisms being constructed and arranged to permit a relative and automatic movement to bring the alinement of the ends of said last and the alinement of said toe and heel lasting mechanisms into correspondence, said toe and heel lasting mechanisms also having the capacity of rolling to accommodate the roll of said last and the capacity of tipping to accommodate the spring of said last, substantially as described.

9. In a machine for lasting boots and shoes, a support for the last, toe and heel lasting mechanisms, means to actuate said toe and heel lasting mechanisms, said last-support and said toe and heel lasting mechanisms being constructed and arranged automatically to permit alinement of the last relatively to the toe and heel lasting mechanisms as an incident to the operation of the latter, substantially as described.

10. A machine for lasting boots and shoes, containing a support for the last, with a shoe thereon, and end lasting mechanism with a member adapted to engage the end of the last and the material thereupon, and means whereby said member on meeting the end of the last or the material thereupon acts automatically to move said end lasting mechanism into position in correspondence with the end of said last as indicated by said positioning member.

11. In a lasting-machine, end lasting-plates, actuating means to move and close the same, a member to bear against the side of the boot or shoe prior to closure of the wiper-plates, and connections between said member and said lasting-plates whereby the latter will be adjusted automatically by movement of said member to act properly upon last ends whether rights or lefts presenting difference of swing.

12. In a machine for lasting boots and shoes, end lasting-plates mounted to swing about a common center, a transverse slide bar connected with said end lasting-plates to govern the relative movement of the latter about their common center and thereby to adapt the same to the swing of the end of the boot or shoe being lasted, whether a right or a left, combined with a swinging member in the form of an end clasp, and connections between the same and said transverse sliding bar for moving the latter and thereby automatically adjusting said end-wiper plates to act properly upon the upper of the boot or shoe being lasted.



13. In a lasting-machine, the combination with the lasting devices and means for actuating the same, of means automatically to cause relative movement of said lasting devices and the last laterally to adapt the same for the swing of lasts either rights or lefts.

601,984. LASTING-MACHINE. MATTHIAS BROCK, Boston, Mass., assignor to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed Apr. 14, 1896. Serial No. 587,488. (No model.)

Claim.—1. In a machine for lasting boots and shoes, a head mounted to swing laterally about a relatively-fixed center, a longitudinally-movable slide-bar supported in the head, and wiper-plates mounted to swing about a common center on said slide-bar, combined with actuating means to move the wiper-plates forward and to close them over the toe of the last, substantially as described.

2. In a machine for lasting boots and shoes, a laterally-movable head mounted to be swung about a relatively-fixed center, a slide-bar in the head, wiper-plates, and carriers therefor, mounted to swing about a common center on the slide-bar, and independent adjustable connections between said carriers and wiper-plates, combined with actuating means to move the carriers forward and to close the wiper-plates, lateral movement of the head about its center adjusting the wiper-plates to act uniformly upon the sides of the last, substantially as described.

3. In a machine for lasting boots and shoes, a base mounted to swing laterally about a relatively-fixed center, a tipping-plate holder supported thereby, and a tipping plate carried by the holder, combined with a slide-bar, wiper-plates mounted thereon to swing about a common center, actuating means to move said plates forward and to close them over the bottom of the last, and an adjusting device for the base, to regulate the lateral movement thereof about its pivot, substantially as described.

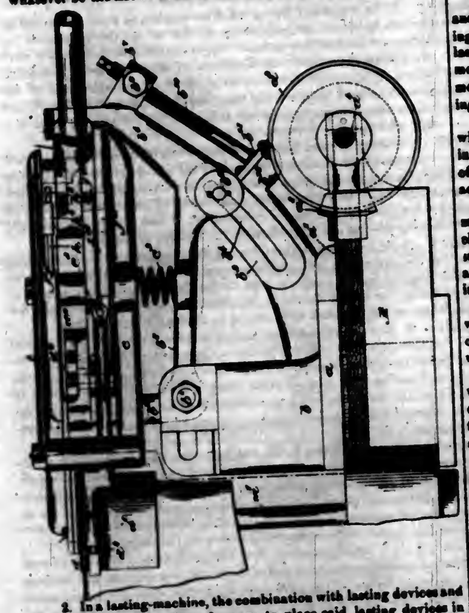
4. In a machine for lasting boots and shoes, a sliding carriage, a head mounted thereon to swing laterally about a pivot beneath the center of the end of the last, and means to retain said head in lateral adjustment on the carriage, combined with wiper-plates carried by the head, and actuating means to move the said wiper-plates forward and to close them over the toe of the last, substantially as described.

5. In a machine for lasting boots and shoes, a head mounted to swing laterally about a relatively-fixed center, the wipers mounted upon the said head, means on said head to actuate the said wipers to wipe the material over and upon the last or the inner sole thereupon, and means to swing said head laterally to adapt the said wipers to lasts, either rights or lefts, having different inclinations, substantially as described.

6. In a lasting-machine, the combination with lasting devices having a capacity for automatically shifting into one or another position to meet ends of right or left shoes presenting differences of swing, of means for manually shifting said lasting devices also into position for meeting ends of right or left shoes presenting differences of swing, substantially as described.

7. In a lasting-machine, the combination of toe-lasting devices and a last-supporting jack, capable of a relative movement about a center substantially in vertical alinement with the central point of the toe of a last on the jack, mechanism for relatively laterally moving the toe-lasting devices and jack to change the longitudinal inclination of the toe-lasting devices and jack to adjust the toe-lasting devices for right and left shoes.

8. In a lasting-machine, the combination with lasting devices to last the end of a shoe and means independent of the last to actuate said lasting devices of a swinging support for said lasting devices, said swinging support enabling said lasting devices to be adjusted to meet the varying swings of last ends whether rights or lefts.



9. In a lasting-machine, the combination with lasting devices to last the end of a shoe of a swinging support for said lasting devices said support being mounted to swing about a center substantially under the center of the adjacent end of the last, to enable said lasting devices to be adjusted to meet the ends of lasts whether rights or lefts presenting a difference of swing.

10. In a lasting-machine, the combination with lasting devices to last the end of a shoe of a swinging support for said lasting devices, means independent of a last to actuate said lasting devices, and means automatically to swing said support with its said lasting devices to adapt the latter to act upon last ends whether rights or lefts presenting a difference of swing.

11. In a lasting-machine, the combintion with lasting devices to last the end of a shoe of a swinging support for said lasting devices means independent of the last to actuate said lasting devices means automatically to swing said support with its said lasting devices to adapt the latter to act upon last ends whether rights or lefts presenting a difference of swing and locking means to lock said swinging support in position.

601,985. LASTING-MACHINE. MATTHIAS BROCK, Boston, Mass., assignor, by mesne assignments, to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed Feb. 14, 1896. Serial No. 579,281. (No model.)

Claim.—1. In a lasting-machine, the combination with lasting devices and actuating means therefor, of means acting automatically to cause said lasting devices in their lasting movement to stop always at substantially the same distance inwardly from the sides of the last, whatever be the size or width of the latter, substantially as described.

2. In a lasting-machine, the combination with lasting devices and actuating means therefor, of means to place said lasting devices in starting positions substantially the same distance from the outside of said last, whatever the size or width of the latter, substantially as described.

3. In a lasting-machine, the combination with lasting devices and actuating means therefor, of means cooperating with the last or the material thereupon for automatically placing said lasting devices in starting positions at substantially the same distance from the outside of said last, whatever the size or width of the latter, substantially as described.

4. In a lasting-machine, the combination with lasting devices, and actuating means therefor, of means cooperating with the last or with the material thereupon to vary the inward limit of lasting movement of said lasting devices, substantially as described.

5. In a lasting-machine, the combination with lasting devices and actuating means therefor, of means to predeterminately vary the inward limit of lasting movement of said lasting devices to meet varying sizes or widths of lasts, substantially as described.

6. In a lasting-machine, the combination with lasting devices of automatic limit-varying means for automatically varying the inward limit of lasting movement of said lasting devices to meet varying sizes or widths of lasts, substantially as described.

7. In a lasting-machine, the combination with lasting devices, of means cooperating with the side of the last or the material thereupon for predeterminately varying the inward limit of lasting movement of said lasting devices to meet varying sizes or widths of lasts, substantially as described.

8. In a lasting-machine, the combination with end lasting devices and means to shift the same laterally to meet right and left lasts, of means to predeterminately fix the limit of lasting movement of said lasting devices always at substantially the same distance inwardly from the outside of the last, whatever be the width of the latter, substantially as described.

9. In a lasting-machine, the combination with end lasting devices, means to shift the same laterally to meet right and left lasts and means to vertically adjust said lasting devices to meet the difference in spring of the lasts, of means to predeterminately fix the limit of lasting movement of said lasting devices always at substantially the same distance inwardly from the outside of the last, whatever be the width of the latter, substantially as described.

10. In a lasting-machine, the combination with lasting devices and positioning devices to vary the inward limit of lasting movement of said lasting devices, of means to successively operate said positioning devices and lasting devices, substantially as described.

11. In a lasting-machine, the combination with lasting devices and predeterminate positioning devices therefor, of a single operating member connected with and to successively operate said positioning and lasting devices, substantially as described.

12. In a lasting-machine, the combination with lasting devices and predeterminate positioning devices therefor, of a single operating member connected with and to operate both said positioning and lasting devices, and furnishing a lost motion between the beginning of movement of the said operating member and the beginning of the movement of said lasting devices during which period said positioning devices are operated, substantially as described.

13. In a lasting-machine, the combination with the swinging wipers and actuating means to open and close the same, of positioning means cooperating with the last to swing the said wipers or either of them into starting position prior to movement of the same by said actuating means, substantially as described.

14. In a lasting-machine, the combination with swinging wipers, means to reciprocate the same and cam-surfaces thereon to open and close said wipers, of positioning means cooperating with said cam-surfaces to change the position of said wipers or either of them in addition to the change in position imparted thereto by said actuating means, substantially as described.

15. In a lasting-machine, the combination with the swinging wipers provided with cam-slots and means to reciprocate the same, of positioning devices cooperating with the sides of the last and provided with studs entering said cam-slots, substantially as described.

16. In a lasting-machine, the combination with the swinging wipers provided with cam-slots and means to reciprocate the same, of positioning devices provided with pins entering said slots, and means to move said positioning devices toward and from the sides of said last, substantially as described.

17. In a lasting-machine, the combination with lasting devices and an operating member therefor, of a positioning device connected with and to be moved by said operating member against the last, and a spring interposed between said operating member and positioning device to enable the latter to be moved after the former contacts with the last or the material thereupon, substantially as described.

18. In a lasting-machine, the combination with the swinging wipers provided with cam-slots, and a handle connected with and to reciprocate said wipers, of fulcrumed positioning devices provided with pins entering said cam-slots and operating-levers connected with said positioning devices, and themselves provided with cam-slots to be operated by said handle, substantially as described.

19. In a lasting machine the combination with lasting devices and actuating means therefor of means for predeterminately varying the movement of said lasting devices by said actuating means to cause said lasting devices to uniformly operate on lasts of varying width, substantially as described.

20. In a lasting-machine, the combination with lasting devices, of means for actuating the same, said means also acting to automatically vary the lasting movement of said lasting devices according to the width of the particular last used, substantially as described.

21. In a lasting-machine, the combination with end lasting devices made laterally adjustable to meet right and left lasts, vertically adjustable to meet different springs of last, and capable of rocking to adapt the same to the inclination of the last-bottom; of means to predeterminately vary the limit of lasting movement of said lasting devices to meet varying widths or sizes of lasts, substantially as described.

22. In a lasting-machine, the combination with end lasting devices and a clasp, and means to shift the said lasting devices and clasp laterally to meet right and left lasts, of means to predeterminately position said lasting devices at the same distance inwardly from the outside of said last, whatever be the size or width of the latter, substantially as described.

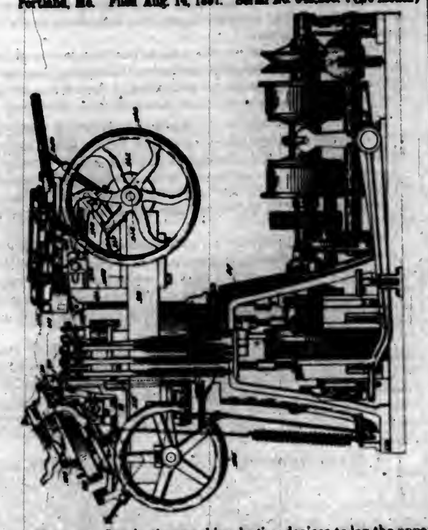
23. In a lasting-machine the combination with lasting devices, a clasp and means to open and close the same; both said lasting devices and clasp having the capacity of lateral shifting or adjustment to meet the varying swings of right or left lasts, of connecting device between said lasting devices and said clasp whereby lateral shifting of one causes lateral shifting of the other substantially as described.

24. In a lasting-machine, the combination with lasting devices, and a yielding clasp capable of adapting itself to different shapes of lasts at the end thereof, of means to shift said yielding clasp laterally to meet right and left lasts, means to vertically adjust said clasp to meet different springs of lasts and to roll it to meet the angle due to the roll of the last, substantially as described.

25. In a lasting-machine, the combination with lasting devices, of a clasp and positioning devices cooperating therewith to predeterminately position said lasting devices at substantially the same distance inwardly from the outside of said last, whatever the size or width of the latter, substantially as described.

26. In a lasting-machine, the combination with the end lasting devices, of the positioning devices cooperating therewith to predeterminately position said lasting devices at substantially the same distance inwardly from the outside of the last whatever be the size or width of the latter, the chain connected therewith and the clasp arranged on said chain, substantially as described.

27. In a lasting-machine, the combination with end lasting devices, the positioning devices cooperating therewith to predeterminately position said lasting devices at substantially the same distance inwardly from the outside of the last whatever be the size or width of the latter, the chain yieldingly connected therewith and the clasp arranged on said chain, substantially as described.



28. In a lasting-machine, the combination with the swinging wipers, the reciprocating slotted actuator therefor, an operating-lever and a pin moving in said slot and operated by said lever, combined with a latch adapted to hold said lever in position with said pin at one end the slot in said actuator, and means to release said latch, substantially as described.

29. In a lasting-machine, the combination with lasting devices, an operating member therefor, connections between said operating member and lasting devices, whereby initial movement of said operating member in one direction takes place without corresponding movement of said lasting devices, and initial movement of said operating member in an opposite direction causes corresponding movement of said lasting devices.

30. In a lasting-machine, the combination with lasting devices, and positioning means therefor, an operating member, operating connections between the same and said lasting devices and positioning means, said operating connections automatically causing movement of said positioning means prior to lasting movement of said lasting devices on movement of said operating member in one direction, but not in an opposite direction.

31. In a lasting-machine, the combination with lasting devices, and positioning means therefor, of an operating member, means connecting the said operating member with said lasting devices and positioning means, said connecting means causing initial movement of said operating member first to operate said positioning means to position the lasting devices prior to effective lasting movement thereof, said connections thereafter connecting said operating member and lasting devices whereby the latter are made directly responsive to the movements of said operating member.

601,936. LASTING-MACHINE. MATTHIAS BROCK, Boston, Mass., assignor to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed Aug. 14, 1897. Serial No. 648,236. (No model.)

Claim.—1. In a lasting-machine, lasting devices to lay the upper over the bottom of the last at an end thereof, and means actuating both lasting devices to impart to one movement in excess of movement of another when the latter meets with undue resistance as compared with resistance to the former.

2. An organized lasting-machine containing a set of toe-lasting devices, and a set of heel-lasting devices to lay the upper over the bottom of a last, and means to impart to one of each set of said lasting devices movement in excess of movement of another lasting device of the same set when the latter meets with undue resistance as compared with the resistance to the former.

3. An organized lasting-machine containing a set of toe-lasting devices and a set of heel-lasting devices to lay the upper over the bottom of the last, and means to impart to the lasting devices of each set, lasting movements the allowance of which is varied and determined by the relative resistances opposed to the movement of the devices of each set, whereby said lasting devices automatically and freely adapt themselves to the ends of a last, whether a right or a left, whatever be its swing.

4. An organized lasting-machine, containing lasting devices for the toe and for the heel which act to lay the upper over the bottom of a last, said lasting devices at each end of the last being mounted at all times to swing freely transversely to accommodate lasts of varying swing, and means independent of said last to advance said lasting devices over the edges of the bottom of the last.

5. In a lasting-machine, lasting devices to act upon the material at the end of the last, actuating means for said lasting devices to cause the latter to freely shift to the right or to the left whenever during the lasting operation the resistance offered to one of said devices unduly exceeds that offered to another of said devices.

6. In a lasting-machine, lasting devices to act upon the material at the end of the last, and means to impart to one of said lasting devices inward movement in excess of another of said lasting devices, said lasting devices at all times being free to shift to the right or to the left when the advance movement of one unduly exceeds that offered to the advance movement of another during the lasting operation.

7. In an organized lasting-machine, the combination with a support to hold the last in substantially fixed position, of end lasting devices to act upon the material at the end of the last, and means to impart to one of said lasting devices movement in excess of movement of another of said lasting devices when the latter meets with undue resistance from the last or the material thereupon.

8. In a lasting-machine, end lasting devices consisting of end-wiper plates, means to open and close said wiper-plates and to cause the same to move one in excess of another when the latter meets with undue resistance as compared with the resistance offered to the former.

9. An organized lasting-machine containing a set of toe wiper plates, and a set of heel-wiper plates, and means to open and close the wiper-plates of each set, and to impart to one of the plates of each set movement in excess of movement of another plate of the same set when the latter meets with undue resistance, as compared with the resistance offered to the former.

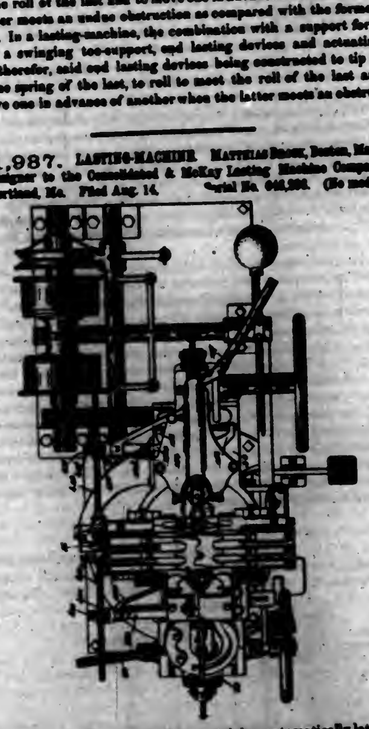
10. A lasting-machine containing a support for a last, and end lasting devices consisting of wiper-plates, means to open and close the same for lasting, and means to enable said plates to freely and laterally move when opening and closing to meet varying lasts, either rights or lefts, or having different side inclinations.

11. In an organized lasting-machine, a support for a last, end lasting devices to act upon the material at the end of a last on said support, and means to effect a relative movement between one of said lasting devices and said last in excess of the relative movement between another of said lasting devices and last when the last-mentioned lasting device is opposed by an undue resistance as compared with the resistance of the first-mentioned last.

12. An organized lasting-machine containing a support for a last, a set of toe-lasting devices and a set of heel-lasting devices, and means to effect a relative movement between one of said lasting devices and said last in excess of the relative movement between said last and another of the lasting devices of the same set when the latter are opposed with undue resistance as compared with the resistance opposed to the former.

13. In a lasting-machine, lasting devices to act upon the material at the end of a last, means to impart to one of said lasting devices a movement at variance with the movement imparted to another of said lasting devices, and means to return the said lasting devices always to substantially the same starting positions.

14. An organized lasting-machine containing a support for a last, and end lasting devices to act upon the material at the end of the last on said support, means to impart to the said last and lasting devices a relative movement, the relative movement of said last and one of said lasting devices being at variance with the relative movement of said last and another of said lasting devices, and means to return said last and said lasting devices to substantially the same relative position after one lasting operation and preparatory to the next.



15. In a lasting-machine, lasting devices to lay the upper over the bottom of the last at an end thereof, and means connected with a plurality of said lasting devices to move one of the same after a cooperating lasting device at the same end of the last has been stopped.

16. In a lasting-machine, the combination with a support for a last, of end lasting devices, and actuating means therefor, said end lasting devices being free to roll to meet the roll of the last and to shift transversely to meet the swing of the last, or to enable one to move relatively to the other when movement of the latter is obstructed.

17. In a lasting-machine, the combination with a support for a last, of end lasting devices, and actuating means therefor, said end lasting devices being movable to change their vertical inclination to meet the spring of the last to change their transverse inclination to meet the roll of the last and to move one in advance of another when the latter meets an undue obstruction as compared with the former.

18. In a lasting-machine, the combination with a support for a last, of a swinging toe-support, end lasting devices and actuating means therefor, said end lasting devices being constructed to tip to meet the spring of the last, to roll to meet the roll of the last and to move one in advance of another when the latter meets an obstruction.

601,937. LASTING-MACHINE. MATTHIAS BROCK, Boston, Mass., assignor to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed Aug. 14. Serial No. 648,238. (No model.)

Claim.—1. A lasting-machine containing automatically laterally adjustable toe-lasting devices, and automatically laterally adjustable heel-lasting devices, and connections between the two, whereby automatic lateral adjustment of the toe-lasting devices causes corresponding lateral adjustment of the heel-lasting devices, and vice versa.

2. A lasting-machine containing automatically laterally adjustable toe-lasting devices, and automatically laterally adjustable heel-lasting devices, and connections between the two, whereby automatic lateral adjustment of the toe-lasting devices causes corresponding lateral adjustment of the heel-lasting devices.

3. A lasting-machine, containing laterally-adjustable toe-lasting devices, and laterally-adjustable heel-lasting devices, and means simultaneously and automatically to adjust said heel and toe lasting devices.

4. In a lasting-machine, the combination with automatically laterally adjustable toe-lasting devices, and automatically laterally adjustable heel-lasting devices, of devices connecting said toe and heel lasting devices, whereby one is automatically actuated by the other, and means whereby the direction of automatic movement of one by the other may be changed as necessary.

5. In a lasting-machine, the combination with the tipping and rolling toe-lasting devices, and tipping and rolling heel-lasting devices, of means for simultaneously automatically and laterally adjusting the said toe-lasting devices and heel lasting devices to meet the swing of a last.

6. In a lasting-machine, the combination with the toe-lasting plates and the heel-lasting plates, and actuating means therefor, of means to adjust laterally the said toe and heel lasting plates automatically and simultaneously to meet varying swings of lasts.

7. In a lasting-machine the combination with the toe-lasting devices, and heel-lasting devices adjustable one toward the other to meet lasts of different lengths, of means for automatically, simultaneously and laterally adjusting said toe and heel.

8. In a lasting-machine, the combination with the automatically laterally adjustable toe-lasting devices, and the automatically laterally adjustable heel-lasting devices, of connections between the two for operating the one by or with the other, and means to vary the extent of movement of one by or with the other.

9. In a lasting-machine, the combination with the laterally-adjustable toe-lasting devices, and laterally-adjustable heel-lasting devices, of means including two shafts connecting the said toe and heel lasting devices for movement of one by or with the other, and means to vary the direction of movement of one of said shafts by or from the other.

10. A lasting-machine, containing laterally-adjustable toe-lasting devices, and laterally-adjustable heel-lasting devices, means for simultaneously and automatically adjusting the said toe and heel lasting devices laterally to meet varying swings of lasts, and means to disconnect said toe and heel lasting devices to enable them to be independently operated when desired.

11. In a lasting-machine containing a support for a last, and toe-lasting devices and heel-lasting devices, combined with means for automatically and simultaneously adjusting said toe and heel lasting devices laterally into positions automatically determined by a last on said support.

12. In a lasting-machine, the combination with a support for a last, of toe-lasting devices and heel-lasting devices, and means set in operation by contact with the last or the material thereupon automatically to shift said toe and heel lasting devices laterally.

13. In a lasting-machine, the combination with a support for a last, of toe and heel lasting devices and a toe-clasp, and means to move the same relatively to the said last upon said support, and connections between the said toe-clasp and lasting devices automatically to shift the latter laterally by or from the former.

14. In a lasting-machine, the combination with toe and heel lasting devices, and a support for a last, of a heel-clasp, and means to move the same relatively to and in cooperation with a last upon the said support, and connections between said heel-clasp and lasting devices automatically to shift the latter laterally by or from said clasp.

15. A lasting-machine, containing laterally-adjustable toe-lasting devices, and laterally-adjustable heel-lasting devices, and connections between the two, whereby automatic lateral adjustment of the one causes corresponding adjustment of the other.

16. A lasting-machine, containing laterally-adjustable toe-lasting devices, and laterally-adjustable heel-lasting devices, and connections between the two, whereby automatic lateral adjustment of the one causes corresponding adjustment of the other, and means for changing the direction of such adjustment of the one by automatic adjustment of the other.

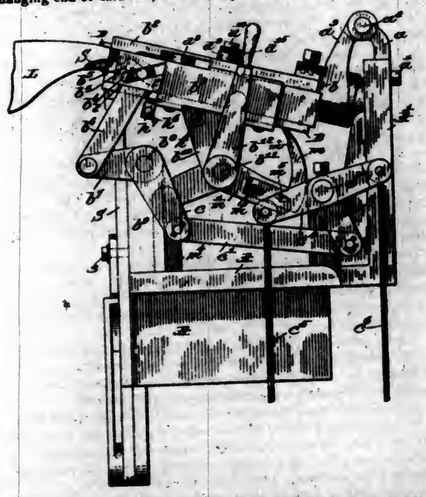
17. In a lasting-machine, the combination with toe and heel lasting devices, and toe and heel clasps or pads, of means connecting said toe-clasp with said heel-lasting devices for laterally shifting the latter by or from the former.

18. In a lasting-machine, the combination with toe and heel lasting devices, and toe and heel clasps or pads, of means connecting said heel-clasp with said toe-lasting devices for laterally shifting the latter by or from the former.

19. In a lasting-machine, the combination with toe and heel lasting devices, of means cooperating with one end of the last to laterally shift the lasting devices at the opposite end of the last.

20. In a lasting-machine, the combination with a support for a last, and toe and heel lasting devices, of a rising-and-falling toe-clasp, and connections between the same and the said toe and heel lasting devices for laterally adjusting the latter by the former.

601,938. LASTING-MACHINE. MATTHIAS BROCK, Boston, Mass., assignor to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed Jan. 18, 1897. Serial No. 618,998. (No model.)



Claim.—1. A support for the last or form, means to engage the material to be lasted and lay the same upon the bottom of said form, the latter and said means having a relative movement in a direction to conform approximately to an overhanging end of said last or form, substantially as described.

2. A support for a last or form, wipers, and means of which said wipers form a part to engage the material and raise said material relatively to said form and also carry said material inwardly to fit the same about the end of said form, substantially as described.

3. In a lasting-machine, a support for a last, end lasting devices to lay the material over the bottom of the last, and means independent of said lasting devices to engage the material upon said last, said last having a relative movement in a direction to conform approximately to the overhanging end of said last, substantially as described.

4. In a lasting-machine, a support for the last, end lasting de-

vices and upwardly-wiping means, and means to cause a relative movement of said last and the said lasting devices, and upwardly-wiping means in a direction to conform approximately to an overhanging end of said last, substantially as described.

5. A support for a last or form, a head, means thereon to engage the material upon said last, the latter and said head having a relative movement in a direction to conform approximately to an overhanging end of said last or form, substantially as described.

6. In a lasting-machine, a support for a last, a head mounted to swing about an axis at a level above the bottom of said last, means on the said head to engage the material, and means to move said head about its said axis to cause the said material to be laid upon said last, substantially as described.

7. The combination with a support for a last or form, and lasting means to engage the material to lay the same over and upon said form and having also a rising-and-falling movement, of an end clasp having a rising-and-falling movement, and means automatically to impart to said clasp and said lasting means a movement longitudinally of the last in addition to said rising-and-falling movement, substantially as described.

8. In a machine of the class described, a clasp having an entrance adjustable as to its width, combined with means for changing the lateral alinement of said clasp without varying the width of said entrance, substantially as described.

9. In a machine of the class described, a clasp adjustable as to its width, and means for bodily swinging said clasp about a center at or in the vicinity of the closed end of said clasp, substantially as described.

10. In a machine of the class described, a clasp, laterally-swinging supporting means therefor, and laterally-swinging connections between said supporting means and the end of said clasp, substantially as described.

11. In a lasting-machine, end wipers, a suitable support therefor, a sliding member longitudinally movable in said support said sliding member and said wipers having the one curved guiding-surfaces and the other cooperating guiding projections of a curvature corresponding to that of said guiding-surfaces, substantially as described.

12. In a lasting-machine, disconnected end wipers, a support therefor, and means for imparting a relative movement to said wipers in a circular path about a common axis of movement, substantially as described.

13. In a lasting-machine, end wipers, a suitable support therefor, a longitudinally-sliding member mounted in said support and carrying said end wipers, a single curved slot and cooperating projecting surfaces furnishing the means for directing the movement of each of said end wipers on and with relation to said sliding member, substantially as described.

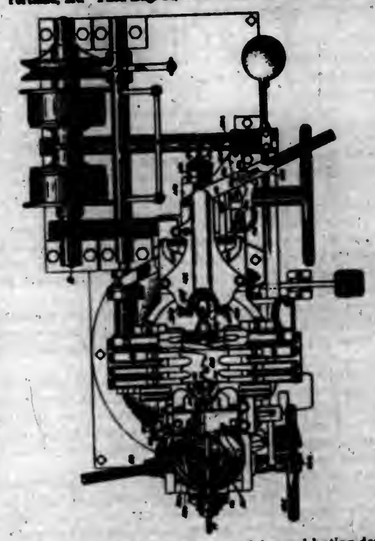
14. In a lasting-machine, end wipers, a support for and on which said wipers have a forward-and-back movement, and fulcrumed connections between said wipers and said support, whereby said forward-and-back movement also causes said plates to be moved for relative opening and closing, substantially as described.

15. In a lasting-machine, end wipers, a support therefor, and wiper-operating devices on said support, projection-and-slot connections between the said wipers and said wiper-operating devices, and means for moving said connections bodily forward and back with the forward-and-back movements of the said end wipers, substantially as described.

16. In a lasting-machine, end wipers, supporting means therefor, means to open and close said wipers, and means movable longitudinally in a rectilinear line to impart to said wipers an auxiliary sidewise movement, substantially as described.

17. In a lasting-machine, lasting devices, actuating means therefor, a plurality of supporting members for and to effect rise and fall of said lasting devices, and oppositely-moving cam-surfaces cooperating with the respective supporting members to effect rolling of said lasting devices, substantially as described.

18. In a lasting-machine, lasting devices, actuating means therefor, means to effect rise and fall of said lasting devices in a direction approximating the overhang at the end of a last, combined with means to roll said lasting devices, substantially as described.



19. In a lasting-machine, lasting devices, actuating means therefor, means to swing said lasting devices to cause rising-and-falling lasting movement, combined with means to roll said lasting devices, substantially as described.

20. In a lasting-machine, the combination of lasting devices with raising and lowering devices therefor, said raising and lowering devices also comprising means for rolling said lasting devices, substantially as described.

21. In a lasting-machine, end lasting devices constructed and arranged to be opened and closed to lay the material over and upon the last or form, said lasting devices having also a forward-and-back movement, a rolling movement to adapt the same to the roll of a last, and a rising-and-falling movement in a direction approximating the line of overhang at the end of a last, substantially as described.

22. In a lasting-machine for boots and shoes, a last or form to hold the boot or shoe to be lasted, combined with lasting devices having a movement to lay the material over and upon said last or form, said lasting devices having in addition a rolling movement in a direction approximating the line of overhang at the end of a last to enable them to lay the material closely about the said overhanging last end, and a shifting movement to the right or left to adapt the said lasting devices to the varying ends of lasts either rights or lefts, substantially as described.

601,989. LASTING-MACHINE. MATTHIAS BROOK, Boston, Mass., assignor to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed Aug. 14, 1897. Serial No. 648,248. (No model.)

Claim.—1. A lasting-machine containing end lasting devices to act upon the material at an end of a last, said lasting devices automatically and normally assuming a position for a last of one swing, and means to shift the said lasting devices into position for a last of opposite swing when necessary.

2. A lasting-machine containing end lasting devices to act upon the material at an end of a last, said lasting devices normally assuming a position for a last of one swing, means to shift said lasting devices into position for a last of opposite swing, and means to vary said normal position and the said position into which the said lasting devices may be swung.

3. A lasting-machine containing heel and toe lasting devices, normally assuming a position for a last of one swing, and means to shift said heel and toe lasting devices into positions for a last of opposite swing when necessary.

4. A lasting-machine containing end lasting devices to act upon and last the material at an end of a last, actuating means for said end lasting devices, and auxiliary means to shift said lasting devices for right and left lasts having a difference of swing, said auxiliary means being dependent for its operation upon the operation of said actuating means.

5. A lasting-machine containing end lasting devices to act upon and last material at an end of a last, actuating means for said end lasting devices, and means auxiliary to said actuating means to shift said lasting devices for right and left lasts, said means being operable by the hand of the operator operating said actuating means in substantially one and the same operation.

6. In a lasting-machine containing end lasting devices to last the material at an end of a last, an operating-handle controlling the lasting operation of said devices, and means operable by a hand engaging said operating-handle to shift said lasting devices for right and left lasts.

7. A lasting-machine containing end lasting devices to last the material at an end of a last, an operating-handle controlling the lasting movements of the said lasting devices, and a movable member mounted on said operating-handle, movement of which relatively to said handle operates to cause said lasting devices to be shifted for right and left lasts.

8. A lasting-machine, containing end lasting devices, an operating-handle for imparting lasting movement thereto, a movable member arranged close to said operating-handle, connections intermediate said movable member and said lasting devices for transversely shifting said end lasting devices to change the allowment thereof by movement of the said movable member, and means to render said connections inoperative.

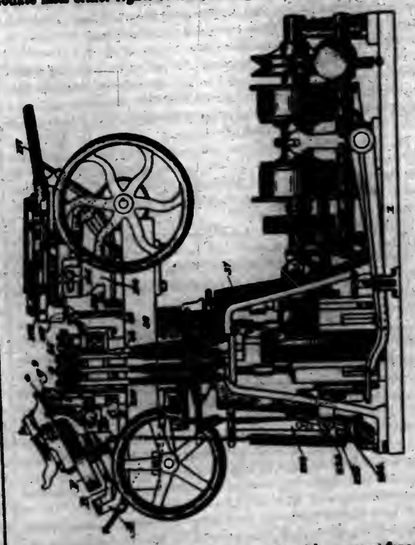
9. A lasting-machine containing end lasting devices, an operating-handle therefor, connecting means under the control of the operator between said operating-handle and lasting devices for transversely shifting the latter on movement of the former at times and not at others, as necessary.

10. In a lasting-machine, the combination with end lasting devices, and means to transversely shift the same for rights and lefts, of means automatically to lock said lasting devices in the positions into which they are shifted during the lasting operation.

11. In a lasting-machine, the combination with end lasting devices, and an operating-handle to impart lasting movement thereto, of locking means for said lasting devices controlled by movement of the said operating-handle.

12. In a lasting-machine end lasting devices to last the material at the end of a shoe, actuating means therefor, means automatically to shift said lasting devices into position to meet the swing of the end of a last and means under the control of the operator for disconnecting said automatic shifting means at will.

601,940. LASTING-MACHINE. MATTHIAS BROOK, Boston, Mass., assignor to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed Aug. 14, 1897. Serial No. 648,209. (No model.)



Claim.—1. In a lasting-machine, the combination with heel and toe lasting devices, of manually-operable means to change by one operation the positions of the heel and toe lasting devices to meet lasts, either rights or lefts, or lasts having a difference of swing.

2. In a lasting-machine, the combination with toe and heel lasting devices, of manually-operable means to simultaneously shift the said toe and heel lasting devices to adapt the same to lasts, either rights or lefts, having a difference of swing.

3. In a lasting-machine, the combination with toe and heel lasting devices, of a manually-operable controlling member or lever, and connections between the same and the said toe and heel lasting devices, whereby movement of the said controlling member moves both said toe and heel lasting devices to accommodate lasts, either rights or lefts, or lasts having a difference of swing.

4. In a lasting-machine, the combination with a support for a last, toe lasting devices, and means for tipping the same, and heel-lasting devices and means for tipping the latter, of manually-operable means for simultaneously shifting the said lasting devices laterally to accommodate lasts, either rights or lefts, having a difference of swing.

5. In a lasting-machine, the combination with a support for a last, toe-lasting devices, and means for rolling the same, and heel-lasting devices and means for rolling the latter, of manually-operable means for simultaneously shifting the said lasting devices laterally to accommodate lasts either rights or lefts, having a difference of swing.

6. In a lasting-machine, the combination with a support for a last, toe lasting devices, and means for tipping and rolling the same, and heel-lasting devices and means for tipping and rolling the same, of manually-operable means for simultaneously shifting the said lasting devices laterally to accommodate lasts, either rights or lefts, having a difference of swing.

7. In a lasting-machine, the combination with a support for a last, toe and heel lasting devices, and means for moving the same toward and from each other to accommodate lasts of different lengths, of manually-operable means for simultaneously shifting the said lasting devices laterally to accommodate lasts, either rights or lefts, having a difference of swing.

8. In a lasting-machine, the combination with a support for a last, the toe and heel lasting devices, and means for moving the same toward and from each other to accommodate lasts of different lengths, said toe and heel lasting devices having respectively means for tipping and rolling the same, of manually-operable means for simultaneously shifting the said lasting devices laterally to accommodate lasts, either rights or lefts, having a difference of swing.

9. In a lasting-machine, the combination with toe and heel lasting devices, of manually-operable means for simultaneously shifting the same to meet lasts, either rights or lefts, having a difference of swing, of means for varying the shifting movement of the said lasting devices by the said manually-operable means.

10. In a lasting-machine, the combination with toe and heel lasting devices, of manually-operable means for simultaneously shifting the same to accommodate lasts, either rights or lefts, having a difference of swing, and means whereby the shifting of the said lasting devices by the said manually-operable means may be in the same or in opposite directions as necessary.

11. In a lasting-machine, the combination with toe and heel lasting devices, of the swinging stands upon which the said lasting devices are respectively mounted, and manually-operable means for simultaneously swinging the said stands to thereby shift the said lasting devices to meet lasts, either rights or lefts, having a difference of swing.

12. In a lasting-machine, the combination with toe and heel lasting devices, and the swinging stands carrying the same, said stands being relatively movable one toward and from the other, of manually-operable means for swinging the said stands and thereby shifting the said lasting devices to meet lasts, either rights or lefts, having a difference of swing.

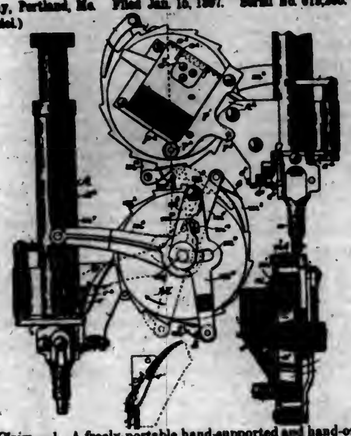
13. In a lasting-machine, the combination with toe and heel lasting devices, a single shaft, and connections between the same and the said lasting devices, whereby rotation of the said shaft in opposite directions shifts the said lasting devices first in one and then in an opposite direction to meet lasts, either rights or lefts, having a difference of swing, and manually-operable means for rotating the said shaft.

14. In a lasting-machine, end lasting devices to act upon and la

connection with an end of a last, of manually-operable means for shifting the said end lasting devices to accommodate an end of a last, either a right or a left, having a difference of swing, and adjustable means for varying the relative movement of said lasting devices and manually-operable means, substantially as described

15. In a lasting-machine, toe and heel lasting devices, and means respectively for actuating the same to lay the material upon the last, of manually-operable means independent of said actuating means for shifting both said toe and heel lasting devices for lasts, either rights or lefts, presenting a difference of swing.

16. In a lasting-machine, toe and heel lasting devices, and supports therefor made movable to adapt said lasting devices to lasts, either rights or lefts, having a difference of swing, and connections between the said movable supports whereby movement of one causes movement of the other.



17. In a lasting-machine, the combination with heel and toe lasting devices, and means whereby said lasting devices automatically shift for lasts having a difference of swing, of means for manually shifting the said lasting devices to adapt the same for lasts having a difference of swing.

18. In a lasting-machine, the combination with heel and toe lasting devices, and means whereby said lasting devices automatically shift for lasts having a difference of swing, of means for manually shifting the said lasting devices to adapt the same for lasts having a difference of swing, said means for manually shifting the said plates being used alone or supplementary to the automatic means as desired.

19. In a lasting-machine, the combination with toe-lasting devices, and actuating means therefor, and supporting means for the same, and heel-lasting devices, actuating means therefor, and supporting means for the same, of means coöperating with and for shifting both the said supporting means to adapt their said lasting devices to the opposite ends of lasts having a difference of swing.

20. In a lasting-machine, toe-lasting devices, actuating means therefor, a toe pad or clasp, and a stand or carrier supporting the same, and heel-lasting devices, a heel-clasp and a stand or carrier therefor, combined with means for simultaneously shifting the said stands or carriers and thereby their respective lasting devices, and clasps to adapt the same for lasts having a difference of swing.

601,941. NAILING APPARATUS. MATTHIAS BROCK, Boston, Mass., assignor to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed Jan. 15, 1897. Serial No. 619,205. (No model.)

Claim.—1. A freely-portable hand-supported and hand-operated nailing apparatus containing in combination a casing adapted to be carried by the hand; a fastening-receptacle mounted on said casing; a reciprocating hand-operable driver and nail or fastening feeding means connected with and deriving feeding movement from said driver, said feeding means and connections between the same and driver moving without change in direction during movement of said driver in any one direction, movement of said driver in opposite directions causing effective movement of said feeding means always in the same direction, substantially as described.

2. In a machine of the class described, the combination with a reciprocating driver, of a fastening-receptacle, and intermittingly-operated means acting always in the same direction to deliver fastenings from the said receptacle for the said driver, and said means being actuated by said driver during movement of the latter in one and also in an opposite direction, substantially as described.

3. A freely-portable hand-supported and hand-operated nailing apparatus containing in combination a casing adapted to be carried by the hand, a reciprocating hand-operable driver, and a rotatable fastening-receptacle, both mounted on said casing and devices actuated by said driver to impart relatively slow and easy step-by-step rotation to said receptacle both on and during substantially the entire driving and on the return movement of said driver, substantially as described.

4. In a nailing apparatus of the class described, a reciprocating driver, a casing, a rotatable fastening-receptacle on said casing and provided interiorly with means to lift the contained nails, nail-conducting means to convey nails from said receptacle to said driver and means actuated by said driver to impart rotation to said receptacle during both the driving and also during the return movement of said driver said means tending to move said receptacle in but one direction during movement of said driver in either direction.

5. The combination with the driver, the casing, a rotatable receptacle and means to impart step-by-step rotation thereto from said driver during the driving and also during the return movement of the latter and a clearer arranged over and clearing the properly-positioned fastenings on said conductor and connecting devices intermediate said rotatable receptacle and said clearer for communicating to the latter a vibrating motion by and from step-by-step rotation of the said receptacle.

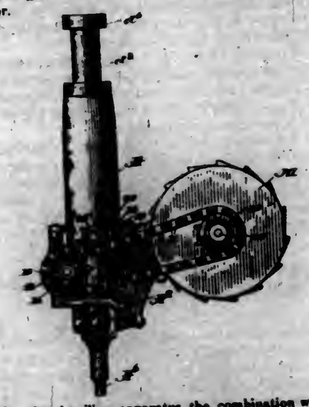
6. The combination with the driver and its case, of a conductor to convey fastenings to the said driver, a spring-controlled fastener-impelling device, having a stop-surface to engage the head of a fastening from said conductor, and means acting upon the shank of the fastening to move the latter into inclined position while its head is yet engaged by said stop-surface, said impelling device being actuated to release the fastening-head when the pressure upon the shank reaches a predetermined degree, substantially as described.

7. The combination with the driver, its case, and the conductor leading to the driver, of a yielding pivoted controller having a stop-surface and means engaging a fastening to press the head of such fastening against such stop-surface first to position the fastening and then to turn said controller on its said pivot to free said fastening substantially as described.

8. In a machine of the class described, the combination with a driver, and a fastening-conductor leading thereto, means for controlling the passage of fastenings toward said driver, said means being constructed to furnish a dwell intermediate the beginning and the end of its movement in one direction in which a fastening can assume proper position for final and accurate movement, substantially as described.

9. In a machine of the class described, the combination with a driver and a fastening-conductor leading thereto, of a fastening separating and feeding gate having a fastening-separating point to separate a fastening from a series of fastenings, and means to impart to said gate an initial movement to cause its said point to separate a fastening, and a final fastening-feeding movement in the same direction as said initial movement but separated from said initial movement by a period of dwell, substantially as described.

10. The combination with a fastening-conductor, of a single means to act upon a fastening in said conductor and move the said fastening into a new position to hold said fastening in its said new position so as to enable the said fastening to be positioned with certainty for a subsequent movement, and to finally impart such subsequent movement to said fastening, substantially as described.



11. In a machine of the class described, a driver and means to convey the fastenings toward said driver, said means holding one or more of said fastenings in position approximately parallel to line of travel of said driver, combined with means to act upon a fastening so positioned to impel the said fastening endwise into the path traversed by said driver, substantially as described.

12. In a machine of the class described, the combination with a driver and a fastening-conductor leading thereto, of means to feed the fastening singly toward said driver, and a yielding impelling device to act upon and retard the movement of the head of a fastening, a face of said impelling device acting as a hammer to positively impel a fastening so retarded toward said driver, substantially as described.

13. In a fastening-driving apparatus, a conductor to receive and guide fastenings, a driver, a fastening-passage in communication therewith and a spring-actuated impelling device to act on a fastening at the end of said conductor and shoot said fastening endwise into said fastening-passage to be in position to be acted upon by said driver, substantially as described.

601,942. HAND NAILING APPARATUS. MATTHIAS BROCK, Boston, Mass., assignor to the Consolidated & McKay Lasting Machine Company, Portland, Me. Filed Aug. 14, 1897. Serial No. 648,237. (No model.)

Claim.—1. In a hand nailing apparatus, the combination with a driver and a driver actuator, of means for controlling the supply of nails to said driver, and an endless flexible connection traveling always in one direction interposed between the said driver-actuator and nail-controlling means, and through which the latter is actuated by the former.

2. In a hand nailing apparatus, the combination with a driver and a reciprocating actuator therefor, of a loose nail-holding receptacle, means controlling the supply of nails therefrom to said driver, and a flexible connection traveling always in one direction interposed between the said driver-actuator and nail-controlling means, and through which the latter is actuated by the former.

3. In a hand nailing apparatus, a reciprocating driver and its actuator, rotary means located at one side of said driver and more or less removed therefrom, to control the supply of nails to said driver, and means to conduct the nails from said rotary nail-controlling means to said driver, combined with means closely adjacent the said driver and its actuator for transforming the reciprocating movement of the latter into a rotary motion, and connections between such means and said nail-controlling means for operating the latter by or from the former, said connections being independent of said controlling means, substantially as described.

4. In a hand nailing apparatus, a case containing a reciprocating driver, a driver-actuator, a rotary nail-controlling part carried by said case, and means to conduct the nails from said nail-controlling part to said driver, combined with means for obtaining a rotary movement by and from the reciprocating movement of said driver or its actuator, and a flexible connection joining such means with and to rotate said nail-controlling part, said flexible connection being independent of said nail-conducting means, substantially as described.

5. In a hand nailing apparatus, a case, a reciprocating driver, its actuator, a rotary feed-controlling part, means to conduct nails therefrom to said driver, and means independent of said nail-conducting means and actuated by said driver and including a flexible connection, for transforming a step-by-step rotary movement always in one direction to said feed-controlling part from said driver or its actuator, substantially as described.

6. In a hand nailing apparatus, a case, a reciprocating driver, and its actuator, a wheel journaled on said case, and devices moved by said actuator to impart a step-by-step rotation to said wheel, a rotary nail-receiving hopper also mounted on said case, and an endless connection joining the same with and to be rotated by said wheel, substantially as described.

7. In a hand nailing apparatus, a case, a reciprocating driver, and its actuator, a wheel, and devices to impart a step-by-step movement thereto from said actuator, a rotary feed-controlling hopper, and a flexible connection positively rotating the same from the said wheel, substantially as described.

8. In a hand nailing apparatus, a case, a reciprocating driver and its actuator, a swinging lever arranged to be moved by said actuator, a wheel and pawl-and-ratchet mechanism interposed between the same and the said lever, a rotary feed-controlling hopper, and a sprocket-chain connecting the same with and to be driven by said wheel, substantially as described.

9. In a hand nailing apparatus, a hand-operated reciprocating driver, and a suitable case, of a rotary nail-controlling part carried by said case, and connections interposed between the said nail-controlling part and said driver and including an endless flexible connection, whereby hand-operated reciprocation of the said driver transmits therefrom through the said flexible connection a rotary movement to the said nail-controlling part.

10. In a hand nailing apparatus, the combination with a suitable case, and a hand-operated driver arranged thereon, of a loose nail-holding receptacle, a raceway to conduct the loose nails therefrom to driving position adjacent the said driver, a rotary feed-controlling part governing the flow of the loose nails to said raceway, and an endless flexible connection interposed between said driver and said rotary nail-controlling part for operating the latter by hand-operated movement of the former.

601,948. BUTTON-REMOVER. STEPHEN R. BUELL, Mine, Ohio. Filed Oct. 14, 1896. Serial No. 608,804. (No model.)

Claim.—1. A button-removing device, comprising a head having an entrance-slot, ways at each side of said slot and inclined away from the entrance end thereof, and a cutter pivoted on the head and movable across the slot to coöperate with one of the edges of said slot to sever the button, substantially as described.

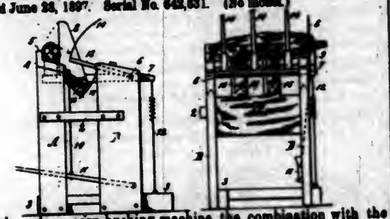
2. A button-removing device, consisting of a head provided with an entrance-slot, ways arranged at each side of said slot and inclined away from the entrance end thereof and having their rear ends arranged to form guards overhanging the cutter, and a cutter pivoted on the head and movable across the slot beneath said guards to coöperate with one of the side edges of the slot to sever the button, substantially as described.

3. A button-remover, consisting of a head having a concaved under surface and provided with an entrance-slot, guards arranged at each side of said slot and inclined away from the entrance end thereof, and a cutter operating across the rear end of said slot and between the head and the rear ends of the guards, substantially as described.

4. The herein-described device comprising a head constituting one of the cutters, a handle attached to said head, a cutter pivoted on and coöperating with said head and provided with a handle, and a spring interposed between and connected at its opposite ends to said handles, said spring being arranged to retract the pivoted cutter and at the same time to press said cutter against the head of the device, substantially as described.

5. The herein-described device, comprising a head constituting also a cutter and provided with a handle, a vibratory cutter having a handle which is deflected to one side of the plane of the cutters in rear of their pivotal connection, and a C-shaped spring having one end attached to one of the handles and its opposite end connected to the other handle, said spring operating to retract the pivoted cutter and to hold said cutter in working contact with the head, substantially as described.

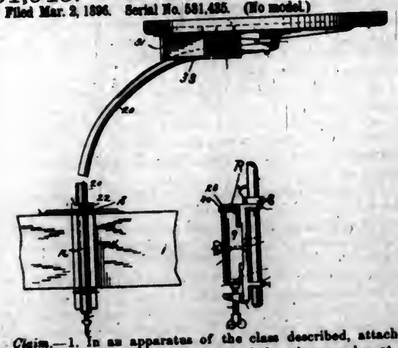
6. A button-removing device comprising a head having an entrance slot, ways at each side of said slot and inclined away from the entrance end thereof, a cutter pivoted on the head and movable across the slot to coöperate with one of the side edges of the slot to sever the button, and a button-receptacle superposed above the cutter to receive the buttons when severed, substantially as described.



7. A button-removing device comprising a head having an entrance-slot, inclined ways sloping upward rearwardly and united at their rear ends, a cutter operating across the inner end of said slot, and a button-receptacle mounted on said ways at their rear ends, substantially as described.

8. A button-removing device, comprising a head having an entrance-slot, inclined ways at each side of said slot extending over the cutter and having their rear ends united and turned upward to form an inclined wall, a cutter operating across the inner end of said slot, and a button-receptacle mounted on said ways, the rear upturned portion of which forms a portion of the bottom of said receptacle, substantially as described.

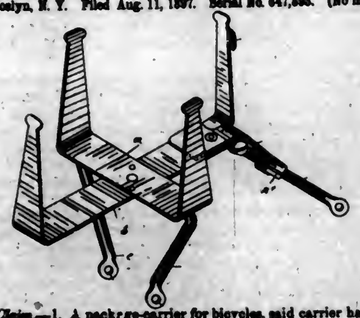
9. A button-removing device, comprising a head having an entrance-slot, a cutter operating across the inner end of said slot, upwardly and rearwardly inclined ways at each side of said slot and extending over the cutter, a button-receptacle mounted on said ways and having an entrance-opening for the buttons, and a flap or gate normally closing said opening but adapted to yield to allow the ingress of the buttons and to prevent the egress thereof, substantially as described.



10. A button-removing device, comprising a head having an entrance-slot, a cutter operating across said slot, upwardly and rearwardly inclined ways at each side of said slot extending over the cutter, a button-receptacle having an entrance-opening for the buttons, a movable gate operating automatically to allow the ingress and prevent the egress of the buttons, a spring-actuated lid or cover for said receptacle, and a projecting lip on said cover, substantially as and for the purpose described.

601,944. CORN-HUSKER. JOHN M. CARLISLE, Spartanburg, S. C. Filed June 28, 1897. Serial No. 642,631. (No model.)

Claim.—In a corn-husking machine the combination with the treadle and an oscillatory arm or lever, of the herein-described stabgage and shearing-knife operated by the lever, the swinging presserbars 13 provided on their free ends with resilient cam extensions, and the duplicate series of convergent spring-fingers provided with stripping-claws, all constructed and arranged to operate substantially as and for the purpose herein specified.

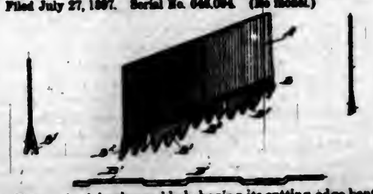


601,945. INVALID-TABLE. JAMES H. CHANDLER, Boston, Mass. Filed Mar. 2, 1896. Serial No. 581,425. (No model.)

Claim.—1. In an apparatus of the class described, attaching means, including a bracket having a fixed clamping member at one end and a foot at the other end, a movable clamping member mounted on said foot, a follower adapted to engage the under side of a bed-rail, means to detachably connect the follower with and to clamp it upon the bracket when vertically adjusted, and a table-supporting standard carried by the bracket, the fixed clamp member bearing against the bed-rail while the movable member acts to hold the follower in adjusted vertical position, substantially as described.

2. In an apparatus of the class described, attaching means, including a longitudinally-slotted bracket having a laterally-extended clamping member rigidly mounted thereon, a movable clamping member also mounted on the bracket, a follower engaged by said movable member, the bed-rail being held between said follower and the fixed clamping member, a headed bolt extended through the follower and the slot in the bracket, and a locking-nut on said bolt, to firmly secure the follower to the bracket, substantially as described.

601,946. BICYCLE PACKAGE-CARRIER. GEORGE G. CLAPHAM, Roslyn, N. Y. Filed Aug. 11, 1897. Serial No. 647,693. (No model.)



Claim.—1. A package-carrier for bicycles, said carrier having a body or main portion formed of rigidly-connected plates with resilient upwardly-bent ends, legs carried on the body portion and formed of a bar having its ends bent downward to form the legs, the intermediate portion of the bar being mounted to rock on the body portion, a clip attached to each of said legs, whereby the legs may be connected with the bicycle-frame, an additional leg hinged to the front of the body portion, and a clip coacting with said additional leg to hold the same on the bicycle-frame.

2. In a package-carrier, the combination of a body portion having an upwardly-extending resilient portion provided with a finger, a leg pivoted to the body portion, and a spring-arm mounted to swing on the body portion and capable of engaging the leg, the leg being capable of swinging up to engage the finger.

3. In a package-carrier, the combination of a body portion having an upwardly-projected resilient portion, a leg pivoted to the body portion and capable of swinging up to engage said resilient portion whereby to hold the leg in inactive position, and a spring-arm pivoted to the body portion and capable of engaging the leg to hold the same in active position.

601,947. HACK-SAW. GEORGE H. CLEMSON, Middletown, N. Y. Filed July 27, 1897. Serial No. 646,094. (No model.)

Claim.—1. A hack-saw blade having its cutting edge bent alternately in opposite directions, the bends being of rectangular form of uniform width and depth, and each extending over a plurality of teeth, the bends extending inwardly beyond the base of the teeth a distance approximately equal to the height of the teeth, substantially as shown and described.

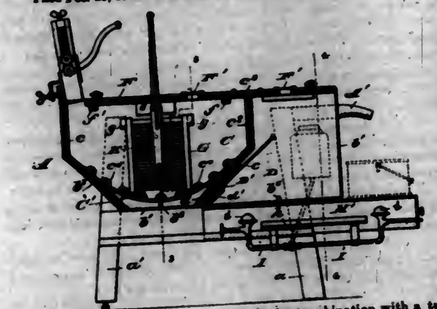
2. A hack-saw blade having its cutting edge bent alternately in opposite directions, the bends standing at right angles to the length of the blade, the bends being of rectangular form of uniform width and depth and each bend extending over a plurality of teeth, the bends extending inwardly beyond the base of the teeth a distance approximately equal to the height of the teeth, substantially as shown and described.

3. A hack-saw blade provided with approximately rectangular bends arranged alternately on opposite sides of the blade and at an acute angle to the main plane thereof, each of said bends extending over a plurality of teeth and also extending inwardly beyond the bases of the teeth a distance approximately equal to the height of the teeth, substantially as described.

601,948. SASH-FASTENER. ALEXANDER COOPER, Lakeview, N. J. Filed Jan. 4, 1897. Serial No. 617,867. (No model.)

Claim.—The combination with the side pieces of a window-frame and with a sash vertically movable between said side pieces, of a rack-rod arranged on each side piece close to the inner face of each stile of said sash and approximately in the same plane therewith, pinions journaled on the face of the stiles and engaging the rack-rods, and each provided with a flange on its perimeter spacing the sash from the rack-rod, a vertically-set pinion inclosed in the bottom rail of the sash and provided with a suitable exposed operating element, and spring-pressed locking-bars also inclosed by the bottom rail and provided at their outer ends with integral and exposed angular extensions engaging the rack-rods and at their inner ends with racks engaging the pinion, said locking-bars being arranged the one above and the other below said pinion, substantially as described.

601,949. CALENDAR. MARTIN COWEE, Bellaire, Ohio. Filed Mar. 13, 1897. Renewed Mar. 10, 1898. Serial No. 673,602. (No model.)



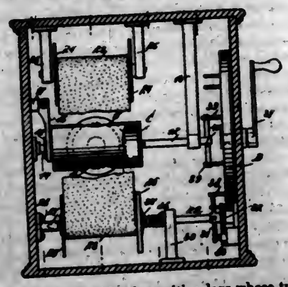
Claim.—1. In a calendar, the combination, with a frame provided with a back and a narrower front extending from the top of the back, terminating at the central portion of the back in a disk, the back being provided with an opening and the front with a corresponding or registering opening, at a margin of each of which openings the names of the days of the week are indicated, of a date-bearing leaf pivoted between the front disk portion of the frame and the back of the frame, revolving between the two members, said date-bearing leaf being provided with a series of radial panels, the inner or contracted ends whereof terminate at the disk portion of the frame, each of said panels bearing characters representing the dates of the days of one week and the name of the month to which the week belongs, all being arranged for the purpose set forth.

2. In a calendar, the combination, with a frame, of a date-bearing leaf mounted to revolve on the frame, said frame being provided with a display-opening, and a pivot on which the date-bearing leaf revolves, the said pivot having one of its ends bifurcated and the members thereof carried in opposite directions, the date-bearing leaf being also provided with a tongue forming a portion of the margin of the opening through which the pivot passes, as and for the purpose specified.

3. In a calendar, the combination, with a frame and a revolving date-bearing disk, the said disk being provided with a central opening and cuts leading therefrom, forming a tongue, of a pivot passed through the frame and through the opening in the disk, one end of said pivot being bifurcated and its members carried in opposite directions, as and for the purpose specified.

601,950. WASHING-MACHINE. ALBERT W. DAVIS, Harvey, Ill. Filed Feb. 22, 1897. Serial No. 624,852. (No model.)

Claim.—1. In a washing-machine, the combination with a tub divided into two compartments, each having a metallic bottom, means for establishing communication between the compartments, the supporting-frame of the tub being provided with depending side pieces, of a heating apparatus which is longitudinally movable with respect to the compartments of the tub, the same consisting of burners, an oil-supply tank in communication with the burners, a slide to which the burners and oil-tank are attached, the slide having openings above the burners and depending side pieces for engagement with the depending side pieces of the tub, substantially as shown and for the purpose set forth.



2. In a washing-machine, the combination with a tub having a metallic bottom and end, a partition dividing the tub into compartments C, D, one compartment having a bed C' with perforations and slats c' having perforations which register with the perforations in the bed, an aperture d in the partition positioned below the bed, the compartment B, being formed by the partition, side pieces of the tub and an upward continuation of the metal bottom; together with a cut-off or closure for the aperture d, substantially as shown and for the purpose set forth.

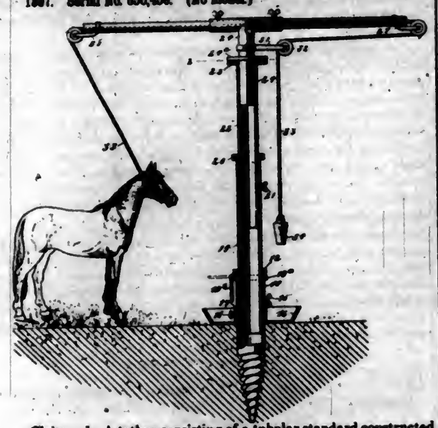
3. In a washing-machine, a tub provided with a metallic bottom and end, a partition dividing the tub into two compartments in combination with a slide carried by the frame which supports the tub, said slide having a cross-piece A with depending brackets, one of the brackets being disposed at right angles to the other brackets as shown, burners, pipes and an oil-tank supported by the brackets and connected thereby to the slide, substantially as shown and for the purpose set forth.

4. In a washing-machine the combination with a tub having a metallic bottom and end, a partition dividing the tub into two compartments, metallic strips H, H, secured to the frame of the tub, the lower edges of said strips being bent inwardly and upward, of a slide H' having a top portion with apertures, depending side portions for engagement with the lower bent edges of the strips a transverse plate carried by the slide, brackets which depend from said plate, an oil-tank, burners and connecting-pipes carried by the brackets so as to move in unison with the slide, the burners being disposed below the apertures in the top portion of the slide, substantially as shown and for the purpose set forth.

5. In a washing-machine a tub having a metallic bottom and depending side plates H, H, in combination with a longitudinally-movable slide carrying heaters and oil-supply tank, said slide having a depending end portion with projecting knobs, and an aperture through which passes a valve-rod which is connected with a burner of the heater nearest the depending end of the slide, substantially as shown and for the purpose set forth.

601,951. KINETOGRAPHIC CAMERA. WARREN R. DAVIS, Brooklyn, N. Y. Filed Apr. 13, 1897. Serial No. 631,967. (No model.)

Claim.—1. The combination, with a lens whose tube has a concaved inner end, and a cylindrical shutter held to revolve close to the concaved surface of the lens-tube, said cylindrical shutter being provided with diametrically opposite openings arranged for the passage of light from one side of the shutter to the other, of a film-carrying device, and mechanism for operating both the shutter and the film-carrying device.



2. The combination, with a lens whose tube has a concaved inner end, and a rotatable shutter adjacent to the concaved surface of the lens-tube, the said shutter being of hollow cylindrical construction and having diametrically opposite openings in its sides, of a film-carrying device, a master-wheel, and a time driving connection between the master-wheel, the film-carrying device and said shutter.

3. The combination, with a lens, and a rotatable shutter adjacent to the lens, of hollow cylindrical construction and provided with diametrically opposite openings in its sides, of a detent for the said shutter, a film-carrying device, a feed for the film-carrying device, a master-wheel, a connection between the master-wheel and said feed for the film, a shifting device for the shutter, and a connection between the said shifting device and the master-wheel, substantially as shown and described.

4. The combination, with a lens, a rotatable hollow cylindrical shutter held to turn in close proximity to the inner end of the lens, being provided with diametrically opposite openings, one in each side, and a two-armed lever connected with a trunnion of the said shutter, of a detent for the said shutter, film-carrying reels, one of which is provided with a star-wheel, a master-wheel, and two series of pins located on the master-wheel, one series of pins being arranged for engagement with the star-wheel and the other series being arranged for engagement with the double-armed lever.

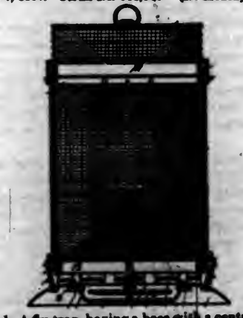
5. The combination, with a lens, a rotatable hollow cylindrical shutter held to turn in close proximity to the inner end of the lens, being provided with diametrically opposite openings, one in each side, and a two-armed lever connected with a trunnion of the shutter, of a detent for said shutter, film-carrying reels, one of which is provided with a star-wheel, a master-wheel, and two series of pins located on the master-wheel, one series of pins being arranged for engagement with the star-wheel and the other series for engagement with the double-armed lever, a ratchet-and-pawl mechanism connected with the support for the star-wheel, and guide-rollers between which the film passes from one reel to the other.

601,952. TETHER. JOHN DAY, Logansport, Ind. Filed Sept. 3, 1897. Serial No. 650,456. (No model.)

Claim.—1. A tether consisting of a tubular standard constructed in adjustable sections, means for securing the sections together, a tubular T-head mounted to turn on the upper section of the standard, a tubular cross-bar extending through the upper or horizontal member of the T-head and projecting at both ends thereof, the said cross-bar being adjustable in the said member of the T-head, guides at the ends of the cross-bar, a tether-rope passing over the said guides and through the said tubular cross-bar, and means for turning said standard for the purpose set forth.

2. In a tether, the combination with a standard constructed in adjustable sections, and locking devices for the sections, the uppermost section of the standard being provided with a flange or table, of a T-shaped tubular head held to turn in the upper section of the standard, the head being provided with a flange or table adapted to turn upon the corresponding part of the standard, a tubular cross-bar secured in the horizontal portion of the T-head, fastening devices for the said cross-bar, guides located at the ends of the cross-bar, a guide carried by the said T-head, and a tether-rope weighted at one of its ends, passed over the said guides and through the said tubular cross-bar, for the purpose set forth.

3. In a tether, the combination, with a standard constructed of tubular telescopic sections, the various sections being provided with fastening devices, of a T-head provided with a horizontal member and fastening devices at said member, a tubular cross-bar secured in the horizontal member of the head, extending beyond both ends thereof, guides located at the ends of the tubular bar and upon the T-head, and a rope weighted at one end, passed over the said guides and through the said cross-bar, whereby the end of the rope adapted for attachment to the animal will be at the side of the standard opposite that at which the weight is located, and whereby the rope will have little frictional contact and the major portion of the rope will be protected, for the purpose specified.



4. In a tether, the combination, with a standard constructed in tubular telescopic sections, sundry of the sections being provided with fastening devices, the upper section being provided with a horizontal flange or table, and a trough carried by the standard, and adjustable thereon, of a T-head having a tubular vertical section, the said T-head being arranged to turn in the upper portion of the standard and provided upon its vertical member with a horizontal flange or table adapted to engage with a corresponding flange or table on the standard, a tubular cross-arm secured in the vertical member of the said head, extending beyond both ends of the said member, fastening devices for the said arm, pulleys secured to the cross-arm, one at each end, and a third pulley secured upon the T-head, and a tether rope or chain provided with a weight at one end, the rope or chain being carried from the weight over the pulley on the T-head, over one of the pulleys on the cross-arm, through the cross-arm and over the opposing pulley on said arm, as specified.

5. A tether consisting of a standard, a tubular cross-bar adjustably held in a support mounted to turn at the upper end of said standard, the said cross-bar extending beyond both ends of said support, a guide-pulley supported at each end of the said tubular cross-bar, the upper peripheral portion of each pulley being in horizontal alinement with the interior of the cross-bar, the support for said cross-bar being also provided with a guide-pulley, and a weighted tether rope or chain passing through the said tubular cross-bar and over the said guide-pulleys, substantially as set forth.

6. A tether, comprising a standard carrying a trough and provided with means for turning the said standard into and out of the ground, a tubular cross-bar held in a support mounted to turn at the upper end of the standard, brackets located at the ends of the cross-bar, the said brackets each carrying a guide-pulley having its upper peripheral portion in horizontal alinement with the interior of the cross-bar, the support for said cross-bar being also provided with a guide-pulley, and a weighted tether rope or chain passing through the said tubular cross-bar and over the said guide-pulleys, substantially as described.

7. In a tether, the combination with a standard made in sections and a tether rope or chain carried by the standard, the base-section of said standard being pointed at its lower end and provided with a spiral thread or flange, and having a rib at its upper end, of a ring loosely encircling the base-section below the rib, and a lever pivoted to the ring and having a cam-head adapted when the lever is carried to the horizontal position to bind the ring upon the section, whereby the base-section may be turned into or out of the ground by means of said lever, as and for the purpose set forth.

601,953. FLY-TRAP. WILLIAM EICHELBERGER, Ash Grove, Ill. Filed Dec. 7, 1897. Serial No. 661,048. (No model.)

Claim.—1. A fly-trap, having a base with a central orifice therein, a pan seated in said orifice and adapted to contain the bait, a post standing centrally on the pan, a float movable vertically on the post and adapted to be sustained by the liquid bait within the pan, an annulus bearing on the base and surrounding the pan and having orifices for the admission of the flies, a cage seated on the annulus, and a funnel within the cage, the funnel overhanging the bait-pan and opening into the cage.

2. A fly-trap having a base with an orifice in the center thereof, a bait-pan seated in the orifice, a post standing on the bait-pan, a float having vertical movement on the post, an annulus seated on the base, and a cage bearing on the annulus and located over the bait-pan.

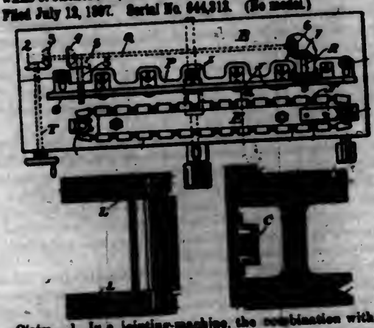
3. A fly-trap having a receptacle for liquid bait, a post standing in said receptacle, and a float movable vertically on the post and capable of being sustained on the bait in said receptacle.

4. A fly-trap, having a base provided with a receptacle for liquid bait, a cage supported on the base, and a float adapted to be sustained on said liquid bait to afford a resting place for the flies.

601,954. SLIDING-JAW WRENCH. ALBERTUS ENOS, Sioux City, Iowa, assignor of one-eighth to Henry B. Jerome, Gardenville, Minn. Filed Sept. 15, 1897. Serial No. 651,733. (No model.)

Claim.—In combination, a hollow handle having slanting rear edges, an extension formed on the rear of the handle with teeth on its upper face, a jaw formed on the forward end of the handle, a shank operating through the hollow handle having teeth to engage the teeth of said handle, a pin in the shank adapted to ride on the incline of the handle and a jaw on the shank lying approximately parallel with the jaw of the handle as the jaws are drawn together by the action of the incline and the pin, as and for the purpose described.

601,955. STRAINER FOR COFFEE-POTS. SIMON J. FREEMAN, Bradford, Pa. Filed July 20, 1897. Serial No. 645,322. (No model.)

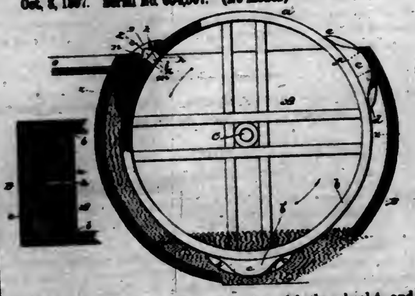


Claim.—1. A removable strainer adapted to be placed within a pot, the said strainer consisting of an inner straining-plate provided with a flange, supports for the inner straining-plate arranged for engagement with the body of the pot, and a forward straining-plate having smaller openings than the rear straining-plate, the said forward straining-plate being supported by the flange of the rear straining-plate, for the purpose set forth.

2. An auxiliary strainer for coffee-pots adapted as an interior strainer, the said auxiliary strainer consisting of an inner straining-plate and a flange connected therewith, the inner straining-plate being at an angle to the flange and pendent therefrom, the said flange being provided with supports arranged for engagement with the body of the pot, and a forward straining-plate, serving as an intermediate straining device when the auxiliary strainer is in position on the body of the pot, the said forward straining-plate having openings of less dimensions than the inner straining-plate and being attached to the flange of the rear straining-plate, for the purpose set forth.

3 An auxiliary strainer for coffee-pots adapted as an interior strainer, the said auxiliary strainer consisting of a rear strainer-plate, a flange connected with the rear straining-plate, from which the latter is downwardly and forwardly projected at an obtuse angle, the flange being provided with a central opening and with hooks arranged for engagement with the upper edge of the body of the coffee-pot to which the attachment is made, and a forward strainer having openings of less dimensions than those of the rear strainer, the forward strainer being provided with a hook arranged to be passed through the opening in the flange of said rear strainer, for the purpose specified.

601,956. GLUE-JOINTING MACHINE. ROBERT M. GLEASON, Edward J. Jamieson, and Alfred E. Watrous, Grand Rapids, Mich. Filed July 13, 1897. Serial No. 644,913. (No model.)



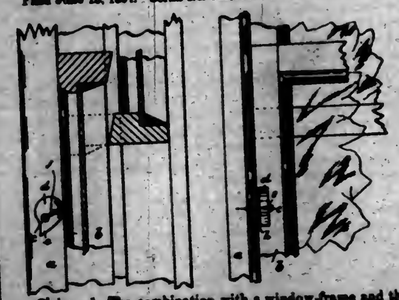
Claim.—1. In a jointing-machine, the combination with a bed, of a stationary guide supported on the bed and grooved on its opposite sides, sprocket-wheels arranged at the opposite ends of said guide, means for rotating the sprocket-wheels, an endless chain lying in the grooves on the sides of the guide and driven by the sprocket-wheels, a series of vertical slats carried by the chain and each provided at its top with a tongue which engages and travels in a corresponding groove in the top of the guide, and at its bottom with a beveled tongue which engages and travels in a beveled groove in the side of the guide, a series of pressure-rollers arranged parallel to the feeding-surface of the slats, a frame supporting said rollers, and means for adjusting said frame toward and from the slats, substantially as described.

2. In a jointing-machine, the combination with a bed, of a stationary guide supported on the bed, and grooved on its opposite sides, sprocket-wheels arranged at the opposite ends of the guide, an endless chain passing around said sprocket-wheels and lying in the grooves on the opposite sides of the guide, means for driving the sprocket-wheels, vertical slats carried by the chain and each provided with an overhanging tongue at its top which engages and travels in a corresponding groove formed in the upper face of the guide and at its bottom with a beveled tongue which engages and travels in a corresponding beveled groove in the side of the guide, a series of pressure-rollers mounted in movable journal-boxes, a spring for each journal-box operating to push forward the journal-box and roller, a frame carrying journal-boxes, rollers and springs, and means for adjusting the frame toward and from the feeding-surface of the slats, substantially as described.

3. In a jointing-machine, the combination with a bed, of a stationary guide supported thereon, sprocket-wheels arranged at the ends of the guide, means for rotating the sprocket-wheels, an endless sprocket-chain driven by the sprocket-wheels, vertical slats carried by the sprocket-chain, tongues formed on the tops of the slats and engaging and traveling in a corresponding groove in the top of the guide, tongues formed on the bottoms of the slats and engaging and traveling in a corresponding groove in the side of the guide, and means for holding the stock parallel to and in contact with the feeding-surface of the slats, substantially as described.

4. In a jointing-machine, the combination with a stationary guide having grooves formed in its top and side respectively, sprocket-wheels arranged at the ends of the guide, an endless chain driven by said sprocket-wheels about said guide, vertical slats carried by the sprocket-chain and each provided at its top and bottom with tongues which engage and are guided by the grooves in the guide, a series of pressure-rollers, each roller mounted in a movable journal-box, a spring for each journal-box and roller, a frame for supporting said journal-boxes, rollers and springs, and means for simultaneously adjusting the opposite ends of said frame for adjusting uniformly the entire series of rollers toward and from the feeding-surface of the slats, substantially as described.

601,957. NORIA. REUBEN P. GRAY, Washington, D. C. Filed Oct. 6, 1897. Serial No. 654,567. (No model.)



Claim.—1. In a noria, in combination with the wheel A, and the casing, the buckets c on the periphery of said wheel, said buckets being prow-shaped, as at d, for the purpose set forth, substantially as described.

2. In a noria, the combination of the wheel having the buckets, the casing forming a water space or chamber on one side of the wheel, and the valves, to prevent the formation of a vacuum in the said water space or chamber, substantially as and for the purpose described.

3. In a noria, the combination with the casing, forming the water space or chamber, of the wheel A having the peripheral buckets, the said buckets having their front and rear ends respectively prow-shaped, as at d, and stern-shaped as at e, for the purposes set forth, substantially as described.

601,958. SASH-HOLDER. ADOLPH HARTHORN, Paterson, N. J. Filed June 15, 1897. Serial No. 640,831. (No model.)

Claim.—1. The combination with a window-frame and the sash arranged therein, of a curved block of fibrous material, pivotally and eccentrically arranged on the window-frame, the eccentric and curved portion of said block being normally beyond the dead-center of rotation of said block and in frictional contact with the said sash, and

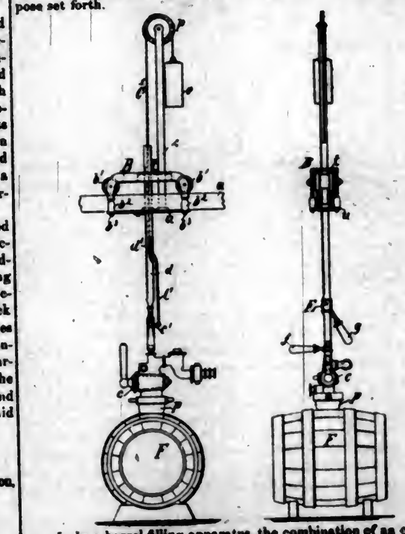
a metallic strengthening-rib in said block and embedded therein and in the radial line to its culminating-point and provided at its outer portion with a segmental-shaped flange also embedded in said block and adapted to strengthen that portion thereof which bears against the sash and to furnish additional weight thereto, substantially as described.

2. The combination with a window-frame and the sash arranged therein, of a curved block of fibrous material pivotally and eccentrically arranged on the frame and provided with a downwardly-extending projection, the curved and eccentric portion being normally beyond the dead-center of rotation of said block and in frictional contact with the sash, a metallic strengthening-rib embedded in said block and provided at its inner end with a sleeve penetrating said block and at its outer end with a segmental-shaped flange, said rib being arranged in the radial line to the culminating-point of the eccentric block, and an axle—such as a screw—penetrating said sleeve and serving as a fulcrum for the block, all said parts, substantially as and for the purposes described.

3. The combination with a window-frame and the sash arranged therein, of a curved block of fibrous material pivotally and eccentrically arranged on the frame and provided with a downwardly-extending projection, the curved and eccentric portion of said block being normally beyond the dead-center of rotation of said block and in frictional contact with the sash, a metallic strengthening-rib in said block and in the radial line to its culminating-point and provided on its sides with a series of lugs or projections embedded in said block, a segmental-shaped flange on the outer end of said rib, and approximately parallel with the outer edge of said curved or eccentric portion of the block, and an axle—such as a screw—penetrating said sleeve and secured to the frame and serving as a fulcrum for the block, all said parts, substantially as and for the purposes described.

601,959. SASH-FASTENER. ADOLPH HARRICHER, Paterson, N. J. Filed Nov. 1, 1897. Serial No. 656,990. (No model.)

Claim.—The combination with a vertically-movable sash and with the window-frame respectively having teeth and a socket oppositely arranged on their adjacent faces, of a bead secured to said frame and provided with an aperture therein, a plate secured to said frame over said socket and extending beneath the bead and its aperture, an elongated spring secured at one end to the outer end of said plate and on the rear face thereof, a bolt and a notched operating-lever rigidly secured to said spring at right angles thereto and penetrating said plate, the bolt being in alinement with said teeth and the lever being in alinement with the bead-aperture, projecting through the same and adapted to be pressed, toward said sash, to operate the spring, and a locking-pawl pivoted to said bead and adapted to engage the notch in said lever, substantially as described.



601,960. BARREL-FILLING APPARATUS. WILHELM HARTMANN, Offenbach-on-the-Main, Germany. Filed Mar. 13, 1897. Serial No. 627,369. (No model.)

Claim.—1. In a barrel-filling apparatus, the combination with a filling appliance, a carrier therefor from which it is suspended to have free up-and-down motion, a counterpoise for said appliance and means for rigidly connecting the same with its carrier, of an overhead track along which the carrier is adapted to travel, for the purpose set forth.

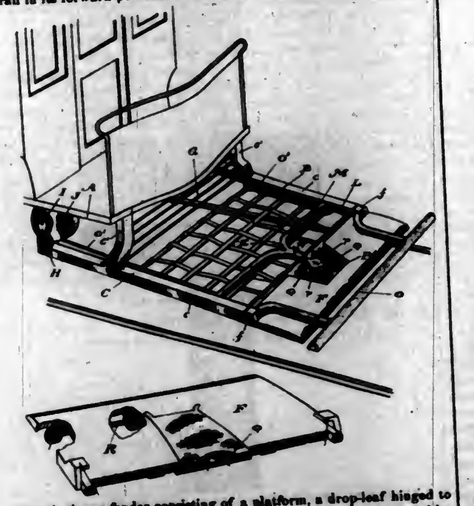
2. In a barrel-filling apparatus, the combination of an overhead track, a carriage adapted to travel thereon, a support displaceable vertically in said carriage, and a locking device for locking said support to said carriage, with a filling appliance connected and having vertical motion with and independently of said support and means for imparting such motion to the filling appliance independently of its support, for the purpose set forth.

3. A barrel-filling apparatus comprising an overhead track, a carriage adapted to travel thereon, a support displaceable vertically in bearings in said carriage, a filling appliance connected and displaceable vertically with and independently of said support a counterpoise for said support and a filling appliance, a locking device for locking the support to its carriage, and means for displacing the filling appliance in a vertical plane independently of its support, for the purpose set forth.

4. In a barrel-filling apparatus, the combination of an overhead track, a carriage adapted to travel thereon and provided with an upright and a pulley journaled thereon, with a support movable vertically in bearings in said carriage, a filling appliance connected and movable with and independently of said support, said parts counterbalanced on the aforesaid pulley, a locking device for locking the support to its carriage, and means for imparting motion to the filling appliance in a vertical plane independently of its support, for the purpose set forth.

5. In a barrel filling apparatus, the combination of an overhead track, a carriage adapted to travel thereon, rolling bearings connected with the outer vertical faces of the track-rails, and an upright carrying a pulley rising from said carriage, with a support movable vertically in bearings in the carriage, a filling appliance connected and movable with and independently of said support, said parts counterbalanced on the aforesaid pulley, a locking device for locking the support to its carriage, and means for imparting motion to the filling appliance in a vertical plane independently of its support, for the purpose set forth.

6. In a barrel-filling apparatus, the combination of an overhead track, a carriage adapted to travel thereon and a spring-actuated locking-dog pivoted to said carriage, with a filling appliance or cock, a cylindrical support therefor provided with teeth extending over a portion of its periphery only, adapted to be engaged by the aforesaid locking dog, said support counterbalanced on the carriage and having endwise and rotary motion in bearings in said carriage, substantially as and for the purpose set forth.



7. In a barrel-filling apparatus, the combination of an overhead track, a carriage adapted to travel thereon and comprising two side bars having turned-down ends terminating in a journal, an antifriction-roller on said journal in contact with the outer vertical face of the track-rails, a bridge connecting the side bars of the carriage above the rails, a bridge secured to the aforesaid journals below said rails, and a spring-actuated locking-dog pivoted to said bridge, with a filling appliance, a cylindrical support therefor provided with teeth extending over a portion of its periphery only, adapted to be engaged by the aforesaid locking-dog, said support being counterbalanced on the carriage and having vertical as well as rotary motion in bearings in the carriage-bridges, substantially as and for the purpose set forth.

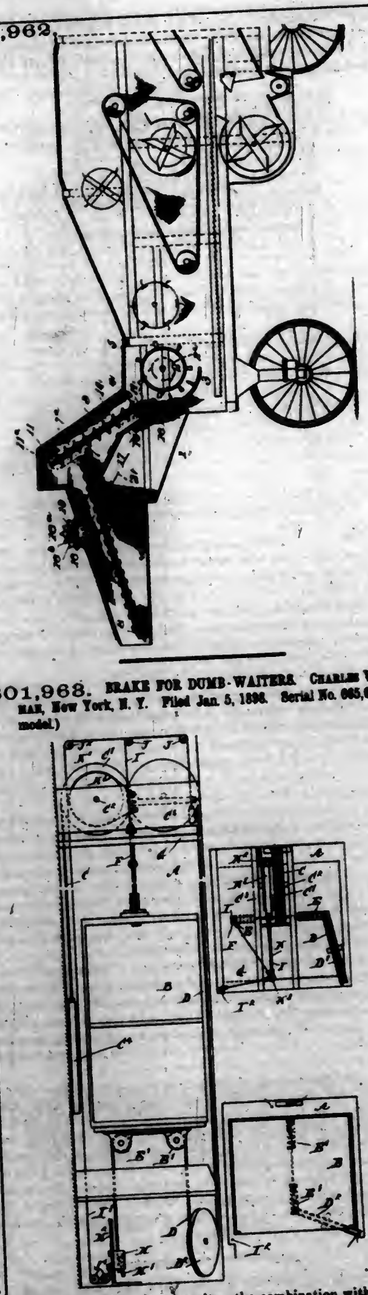
601,961. FENDER FOR CARS. HENRY HAYWOOD and GEORGE TOTTEN, Toronto, Canada; said Haywood assignor to said Totten; said Totten assignor of one-fourth to Harry F. Lowe, same place. Filed July 13, 1897. Serial No. 644,462. (No model.)

Claim.—1. A car-fender consisting of a platform, a drop-leaf hinged to the front of the platform, guides at the side of the platform, guides on the hinged leaf in continuation of the platform-guides, a movable guard-rail sliding in the said guides, and when in its forward position adapted to hold the drop-leaf clear of contact with the rails or road-bed, substantially as specified.

2. A car-fender consisting of a platform, a leaf hinged to the front of the platform, a movable guard-rail at the front of the fender adapted to hold the hinged leaf normally clear of the road-bed, and means for withdrawing the guard-rail to the rear of the platform when meeting an obstacle substantially as specified.

3. A car-fender consisting of a platform, a drop-leaf hinged to the front of the platform, guides at the sides of the platform, guides on the hinged leaf in continuation of the platform-guides, a movable guard-rail sliding in the said guides, and when in its forward position adapted to hold the drop-leaf clear of contact with the rails or road-bed, a lock carried by the drop-leaf to releasably hold the guard-rail in its forward position, substantially as specified.

4. A car-fender consisting of a platform, a drop-leaf hinged to the front of the platform, guides at the side of the platform, guides on the hinged leaf in continuation of the platform-guides, a movable guard-rail sliding in the said guides, and when in its forward position adapted to hold the drop-leaf clear of contact with the rails or road-bed, and means to cause the withdrawal of the guard-rail to the rear of the platform when meeting an obstacle, substantially as specified.



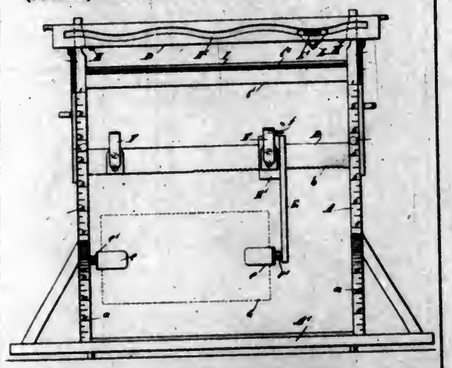
5. A car-fender consisting of a platform, a drop leaf hinged to the front of the platform, guides at the side of the platform, guides on the hinged leaf in continuation of the platform-guides, a movable guard-rail sliding in the said guides, and when in its forward position adapted to hold the drop-leaf clear of contact with the rails or road-bed, a lock carried by the drop-leaf to releasably hold the guard-rail in its forward position, and means to cause the withdrawal of the guard-rail to the rear of the platform when meeting an obstacle, substantially as specified.

6. In a car-fender, the combination of a platform, a drop-leaf hinged to the front of the platform, guide-rails at the sides of the platform, and guides carried by the drop-leaf in continuation of the guide-rails, a sliding frame moving in the guides, and when in its forward position adapted to hold the drop-leaf clear of contact with the rails or road-bed, a lock carried by the drop-leaf, a bolt carried by the frame, adapted to be engaged by the lock, a guard-rail carried by the frame, adapted to project beyond the drop-leaf when the frame is in its forward position, a shaft journaled in suitable bearings mounted on the platform, drums carried by the shaft, flexible connections secured to the sliding frame, adapted to be wound on the drums, and a spring to actuate the said shaft, substantially as specified.

601,962. BAND-CUTTER AND FEEDER. JOSEPH F. HOSKEN, Scandia, Kans. Filed Aug. 5, 1897. Serial No. 647,298. (No model.)

Claim.—The combination with the main frame 1 of a threshing-machine, of a beating drum or cylinder 2 mounted therein, a covered frame or inclosing housing 4 hinged at its inner end to the feeding-in end of the main frame and adapted to be turned over upon the same, the concave-breasting 3, an upwardly-inclined carrier 6 mounted on shafts journaled in said frame, a carrier-rake 7 also mounted on shafts journaled in the frame 4 and extending at an angle to the bundle-carrier and on a line between the cylinder and breasting, a guide-board 15 fixed to the frame 4 and extending parallel with the lower end of the said carrier-rake, said guide-board having its lower end rigidly secured to the concave and provided with an integral thickened deflecting portion 16 contiguous to the same, and its upper end provided with an inclined extension 17 extending beneath the delivery end of the carrier 6, a rotary band-cutter also mounted in the frame 4 above said carrier 6, and means for operating the cylinder, carrier, carrier-rake and band-cutter, substantially as described.

601,962



601,968. BRAKE FOR DUMB-WAITERS. CHARLES W. HOFFMAN, New York, N. Y. Filed Jan. 5, 1898. Serial No. 665,690. (No model.)

Claim.—1. In a dumb-waiter, the combination with a cage, of a hoisting-rope therefor, movable pieces with which the ends of the ropes are connected, a brake mechanism, and connections between said movable pieces and said brake mechanism, whereby the brake is released whenever a pull is exerted on the said rope, substantially as shown and described.

2. In a dumb-waiter, the combination with a cage, of a hoisting-rope therefor, slides having a limited sliding motion and with which the ends of the said rope are connected, a brake mechanism nor-

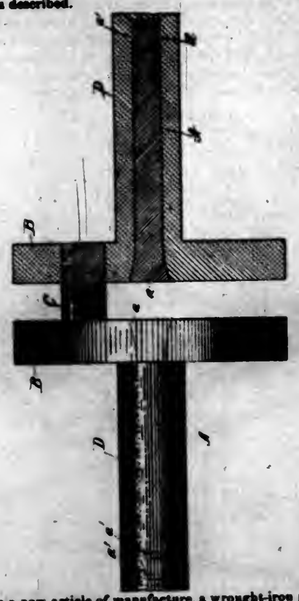
mally braking the counterbalance of the dumb-waiter, and connections between the said slides and the said brake mechanism, whereby the brake is released whenever a pull is exerted on said rope, substantially as shown and described.

601,964. CLOTH MEASURING AND CUTTING DEVICE. WILLIAM B. HOOD, Waco, Tex. Filed June 29, 1897. Serial No. 642,837. (No model.)

Claim.—1. A cloth measuring device having two spaced bars for measuring the cloth, bars between which the cloth may be secured, one of said clamping-bars having a sinuous or waved slot therein which approaches and recedes from the cloth, a block slidable in said slot, and a knife attached to said block and adapted to engage the cloth where secured between the bars, whereby a vertically-reciprocating movement is given to the knife during its horizontal traverse, substantially as described.

2. A cloth-measuring device, having two spaced clamping-bars for measuring the cloth, bars between which the cloth may be secured, an elastic cushion between the bars, one of said bars having a sinuous or waving slot therein which approaches and recedes from the cloth, a block slidable in said slot, and a knife attached to said block and projecting across the space occupied by the cloth, whereby a vertically-reciprocating movement is given to the knife during its horizontal traverse, substantially as described.

3. A cloth-measuring device, comprising a base, supporting-posts mounted thereon, a bar connecting said posts, a depending arm adjustable on said bar, pivots for the bolt or roll of cloth, one on said depending arm and the other on the supporting-posts, two spaced bars over which the cloth is drawn for measuring, a clamp adjacent to one of said spaced bars having a sinuous or waving knife-guide, and a knife movable on said clamp for cutting the cloth, whereby a vertically-reciprocating movement is given to the knife during its horizontal traverse, substantially as described.



4. A cloth-measuring device, comprising a supporting-frame, a cross-bar, an arm adjustable on said cross-bars, pivots for the cloth bolt, one upon said adjustable arm, spaced bars for measuring the cloth, one of them being provided with a waving or sinuous knife-guide, a sliding knife mounted on said guides, and spring clamping-fingers adapted to hold the measured cloth while being cut, substantially as described.

5. A cloth-measuring device having two clamping-bars between which the cloth passes and by which it may be held, a scale using said bars as a base of measurement, both of said bars having a straight slot extending laterally the cloth and in line with each other, and one of said bars having a slot extending substantially at right angles to the other and connecting therewith, said slot approaching and receding from the clamping-surface in a waving or sinuous manner and a knife-blade within the straight slots having a guide sliding in the waving slot whereby a vertical reciprocating movement is given to the knife during its horizontal traverse.

601,965. COMBINED CRANK SHAFT AND DISK. ALBERT L. IDE, Springfield, Ill.; Addie F. Ide, Francis P. Ide, and Roy W. Ide executors of said Albert L. Ide, deceased. Filed Feb. 1, 1897. Serial No. 621,467. (No model.)

Claim.—1. As a new article of manufacture, a strengthening rod or core of metal, and an engine crank shaft and disk formed in one integral casting about said rod or core, substantially as described.

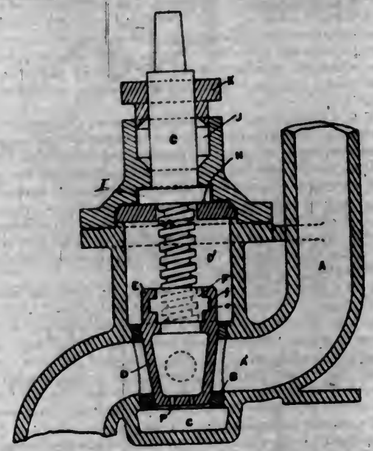
2. As a new article of manufacture, the combination of an axially-disposed strengthening rod or core of metal, with a crank shaft and disk formed in one integral casting about said rod or core, substantially as described.

3. As a new article of manufacture, a wrought-iron rod or core, and an engine crank shaft and disk formed in one integral casting about said rod or core, substantially as described.

4. As a new article of manufacture, an engine crank shaft and disk formed in one integral casting, and a wrought-iron rod or core contained within said shaft and disk, said core being flared at the disk end and scored at the opposite end, substantially as described.

5. As a new article of manufacture, a strengthening rod or core of metal which is scored, and an engine crank shaft and disk formed in one integral casting about said rod or core, substantially as described.

601,966. MANUFACTURE OF SEAMLESS DRAWN TUBES. ELLWOOD IVINS, Philadelphia, Pa. Filed Apr. 19, 1897. Serial No. 633,813. (No model.)

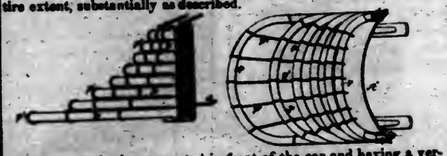


Claim.—1. The mode herein described of making seamless drawn metal tubes having walls of greater or less thickness between the ends than at the ends, said mode consisting in inserting in a tube, before drawing the same, a mandrel having an external configuration, similar to that of the desired internal configuration of the drawn tube, then compressing the tube upon the mandrel so as to cause it to conform internally to the external shape of the mandrel, then expanding the tube by subjecting to intermittent pressure the outside of those portions of the tube which have the least internal diameter, and then withdrawing the mandrel from the tube, substantially as specified.

2. The mode herein described of making seamless drawn metal tubes having walls of greater or less thickness between the ends than at the ends, said mode consisting in inserting in a tube, before drawing the same, a mandrel having an external configuration similar to that of the desired internal configuration of the drawn tube, then compressing the tube upon the mandrel so as to cause it to conform internally to the external shape of the mandrel, and then expanding the tube by subjecting to intermittent pressure the outside of those portions of the tube which have the least internal diameter, and then withdrawing the mandrel from the tube, and then again subjecting the tube to pressure throughout its length, whereby it is reduced in diameter and a surface finish is imparted to it, substantially as specified.

3. As a new article of manufacture, a seamless drawn metal tube, having its walls between the ends of greater or less thickness than at the ends, the difference in gage between the thick and thin portions of the tube exceeding two gages, substantially as specified.

601,967. HYDRANT, STOP-VALVE, OR THE LIKE. CHARLES JONES, Liverpool, England. Filed May 22, 1897. Serial No. 637,755. (No model.)



Claim.—1. In a hydrant or stop-valve, the combination with the shell or casing, of a conical valve-seat locked or retained therein by lateral set-screws; a cone valve having relief-holes formed in its lower end; a nut carried freely by the upper end of the valve; and a stem or rod working in said nut for raising and lowering the same and the valve, substantially as described.

2. The combination in a hydrant or stop-valve, of shell or casing, a chamber C formed in the lower part thereof, a conical valve-seat mounted in the shell above said chamber, set-screws extending through the shell and holding the seat in place, a chamber D' above the seat, a conical valve provided with openings in its lower end, a nut loosely mounted in the upper end of said valve, a rotary screw-spindle engaging said nut, and means for preventing endwise movement of the spindle.

3. The combination in a hydrant or stop-valve, of a shell or casing, a chamber C formed in the lower part of the casing, a conical valve-seat mounted in the shell above said chamber, set-screws extending through the shell and holding the seat in place, a chamber D' above the seat, a conical valve provided with openings P in its lower end, a nut F having wings *f* extending into recesses said recesses being of such size as to allow a limited play of the parts, a screwed spindle engaging said nut, means for holding said spindle against endwise movement, and means for guiding and holding the nut and valve against rotation as they are raised and lowered.

601,968. CAR-FENDER. JOHN KELLER, Philadelphia, Pa. Filed June 26, 1896. Serial No. 596,891. (No model.)

Claim.—1. A fender of the pick-up class having a contracted projecting nose portion, and a vertically-thickened rear portion bearing rigidly on the frame of the car, the projecting portion of the fender being flexible and elastic in all directions throughout its entire extent, substantially as described.

2. A car-fender supported in front of the car and having a vertical support upon the truck-frame, and a vertically-movable connection with the front portion of the car-body, whereby teetering movements of the latter will not cause like movements of the fender, said fender being free to be lifted vertically from its supports, substantially as specified.

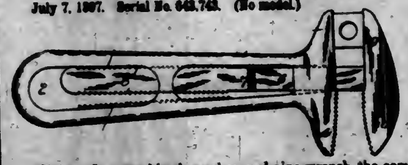
3. A car-fender of the pick-up class, having its portion projecting beyond the car flexible and elastic throughout and provided with means for introducing air into the same and maintaining it therein under pressure, substantially as specified.

4. A car-fender consisting of a supporting-frame and a series of hollow flexible pipe-sections projecting forwardly beyond said supporting-frame and supported thereupon one above another but having no rigid support in the projecting portions, substantially as specified.

5. A car-fender consisting of a supporting-frame and a series of flexible pipe-sections projecting forwardly beyond said supporting-frame and supported thereon, one above another but having no rigid support in the projecting portions, and flexible stays or braces connecting said pipe-sections, substantially as specified.

6. The within-described wheel-guard for cars, said guard consisting of a cushion applied to the forward side of the brake-beam, substantially as specified.

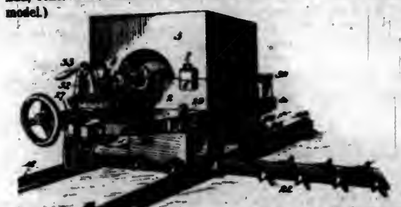
7. The within-described wheel-guard for cars, said guard consisting of a cushion applied to the forward side of the brake-beam and overlapping the shoes, substantially as specified.



601,969. METHOD OF MANUFACTURING CUTTING-BLOCKS. FRIEDRICH R. LAUN, Leipsic-Anger, Germany. Filed Dec. 7, 1896. Serial No. 614,541. (No specimens.) Patented in Germany Feb. 26, 1896, No. 90,893; in England Sept. 3, 1896, No. 19,837; in France Sept. 17, 1896, No. 260,733; in Austria Sept. 23, 1896, No. 46/3,797, and in Hungary Oct. 14, 1896, No. 7,264.

Claim.—1. The method for producing backing, cutting or punching blocks by soaking plates of pasteboard in a solution of glue, kitchen salt, glycerin and water, treating them in a bath of alum and water, pasting the plates together, and subjecting the resulting blocks to pressure, substantially as described.

2. The method for producing backing, cutting or punching blocks by soaking plates of pasteboard in a heated solution of glue, kitchen salt, glycerin and water, treating them in a bath of alum and water, pasting the plates together, and subjecting the resulting blocks to pressure, substantially as described.

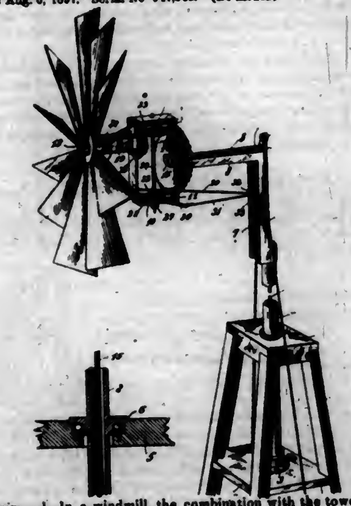


3. The method for producing backing, cutting or punching blocks by soaking plates of pasteboard in a heated solution of glue, kitchen salt, glycerin and water, treating them in a bath of alum and water, pasting the plates together with a composition of casein, glue, starch and water, and subjecting the resulting blocks to pressure, substantially as described.

601,970. COMBINED NUT AND PIPE WRENCH. OLOF LARSON and CHARLEY BRAMELL, Ashland, Wis., assignors of part to Charley Hilton, S. Gust Peterson, Axel Fridstrom, John Sundell, Monson & Larson, Walfrid Nystrom, and Andrew C. Anderson, same place. Filed July 7, 1897. Serial No. 643,743. (No model.)

Claim.—In a combined monkey and pipe wrench, the combination with the handle having stationary jaws at the end and formed with a central recess forming rigidly-connected arms, having rack-teeth in the inner edges and said handle at the front end with a tapering opening, of the shank passing through said opening and having jaws at one end, and formed with rack-teeth on opposite sides or edges, substantially as described.

601,971. MINING-MACHINE. DAVID A. LEE and THOMAS B. LEE, Centreville, Iowa. Filed Feb. 16, 1897. Serial No. 623,653. (No model.)



Claim.—1. In a mining-machine, the combination of a frame, provided at one side with bearings, a stub-axle journaled in said bearings and provided with a carrying-wheel, a support mounted on the frame at the opposite side thereof, a vertically-movable standard passing through an opening of the frame and having a bifurcated lower portion and a tubular upper portion the latter being interiorly threaded, a wheel journaled in the lower portion of the standard, a vertical adjusting-screw swiveled to and depending from the support, said screw engaging the tubular portion of the standard and adapted to raise and lower the frame, and a motor-shaft connected with and actuating the stub-shaft, substantially as described.

2. In a mining-machine, the combination of a frame provided at one side with bearings, a stub-axle journaled in said bearings and having a carrying-wheel, a support mounted on the frame at the opposite side thereof, a vertically-movable tubular standard passing through the frame and having an interiorly-threaded tubular upper portion, a wheel carried by the standard, an adjusting-screw swiveled to the bracket or support and engaging the standard, the vertical shaft 35 journaled on the frame, the longitudinal motor-shaft, gearing connecting the lower end of the shaft 35 with the stub-axle, a worm arranged on the motor-shaft, the gear-wheel 34 meshing with the worm and mounted on the vertical shaft 35, the clutch-section 41 connected with the gear-wheel 34, the sliding clutch-section 40 keyed to the shaft, and a clutch-lever fulcrumed on the frame and connected with the sliding clutch-section, substantially as described.

3. In a mining-machine, the combination of a frame provided with an opening, an inverted-U-shaped support mounted on the frame over the opening, a vertically-movable standard mounted in the opening of the frame and having a tubular upper portion and a bifurcated lower portion, the upper portion being interiorly threaded, a wheel journaled in the lower portion of the standard, and a vertical adjusting-screw swiveled to and depending from the support, said screw engaging the tubular portion of the standard and adapted to raise and lower the frame, substantially as described.

601,972. WINDMILL. RUDOLPH LEONHART, Jr., Fresno, Cal. Filed Aug. 6, 1897. Serial No. 647,363. (No model.)

Claim.—1. In a windmill, the combination with the tower and the mast supported to turn axially therein, of a frame rigidly connected to the upper end of the mast, a frame pivotally supported by the first frame and arranged to swing horizontally, a wind-wheel carried by the pivoted frame and adapted to swing horizontally into and out of the wind, and means to turn the wind-wheel frame on its pivot and secure it in position, substantially as described.

2. In a windmill, the combination with the tower and the mast supported to turn axially therein, of a U-shaped frame rigidly connected to the upper end of the mast, a similar U-shaped wind-wheel-supporting frame, the upper and lower horizontal arms of which are respectively supported on the upper and lower horizontal arms of the first-named frame, a vertical shaft supported by the horizontal arms of the said frames and serving as a pivot for the supporting-frame, a wind-wheel carried by the said frame, and means to turn the wind-wheel frame on its pivot and secure it in position, substantially as described.

3. In a windmill, the combination with a tower and the mast supported to turn axially therein, of a U-shaped frame rigidly connected to the upper end of the mast, a similar U-shaped frame, the upper and lower horizontal arms of which are respectively supported on the upper and lower arms of the first-named frame, a vertical shaft supported by the horizontal arms of the said frames and serving as a pivot for the supported frame, a wind-wheel carried by the pivoted frame, a spring coiled around the lower end of said shaft and having its ends secured to the lower horizontal arms of the respective frames to turn the pivoted frame in one direction, a lever and rope secured to the pivoted frame to turn it in the opposite direction, and stops on the frames to limit the movement of the pivoted frame by the spring, substantially as described.

4. In a windmill, the combination with a tubular mast and the wind-wheel, of two oppositely-disposed U-shaped frames, one being pivotally supported by the other, the supporting-frame being rigidly connected to the mast and the pivoted frame carrying the wind-wheel, a spring to turn the wind-wheel frame on its pivot, in one direction, stops to limit the movement of the said frame by the spring, and means to turn said frame in the opposite direction, substantially as described.

5. In a windmill, the combination with a tubular mast and the wind-wheel, of two oppositely-disposed U-shaped frames, one being pivotally supported by the other, the supporting-frame being rigidly connected to the mast and the pivoted frame carrying the wind-wheel, a spring to turn the wind-wheel frame on its pivot in one direction, stops to limit the movement of said frame by the spring, a lever secured to the lower horizontal arm of the pivoted frame and extending diagonally across it, and ropes secured to the ends of said lever to turn the wind-wheel frame on its pivot and secure it in position, substantially as described.

6. In a windmill, the combination with the tower, the tubular mast supported to turn axially therein, and the pump-rod, of spaced vertical arms secured to the upper end of the mast, spaced horizontal arms extending from the upper ends of said vertical arms, a U-shaped frame rigidly secured to the ends of said horizontal arms, bearings secured between said horizontal arms, a shaft journaled in said bearings and having a crank connection at one end of the pump-rod, a beveled gear on the other end of said shaft within the U-shaped frame, a second U-shaped frame pivotally supported by the first-named frame, a wind-wheel shaft journaled in bearings carried by the said second frame, a beveled pinion on the wind-wheel shaft, a beveled gear meshing with the said pinion and the beveled gear on the crank-shaft, and means to turn the windmill-frame on its pivot, substantially as described.

601,978. CENTRIFUGAL FILTER. JOSEPH A. LOMBAS, Lockport, La., assignor of one-half to Ernest Amidee Boudreau, Cypre Mort, La. Filed Sept. 26, 1897. Serial No. 653,031. (No model.)

Claim.—1. In an apparatus for filtering cane juice, the combination with the casing, of the rotatable perforated drum located therein provided with a removable bottom and a removable top ring, the removable filtering-cloth on the inner side of the drum, the edges of which are inserted in grooves in said bottom and ring, and the hooks pivoted to said bottom and engaging with eyes secured to the ring for connecting and holding said bottom and ring in place, substantially as described.

2. In an apparatus for filtering cane-juice, the combination with the casing, the rotatable shaft, and the annular flange in the bottom of said casing, of the perforated drum secured to said shaft, the bottom of which is formed with discharge-openings, the filtering-cloth, at the inner side of said drum, the annular flange on the bottom of said drum outside of said openings, the cone secured to said shaft, and the pivoted lever, the inner end of which is connected with the drum, substantially as described.

601,974. SUSPENDING DEVICE FOR HORSE-BOOTS, &c. PAUL MESSNER, Glenville, Md. Filed July 26, 1897. Serial No. 645,985. (No model.)

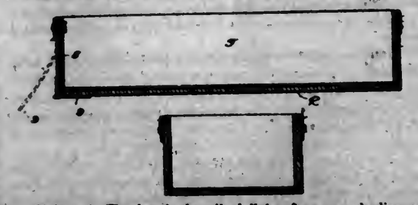
Claim.—The combination of horse-boots and a suspender for holding the boots in proper adjustment, consisting of a strap extending over the back, a neck-strap, bracelets or straps 9 adapted to be applied to the forearm of a horse suspended by said straps, and means for connecting the bracelet with the front and rear edges of the boots, whereby the boots will be held centrally below the hoofs of the horse without tendency to tilt or upset, substantially as described.

601,975. PERMUTATION-LOCK. JOHN H. MOORE, Seward, Nebr. Filed July 19, 1897. Serial No. 645,062. (No model.)

Claim.—1. A permutation-lock, comprising a rotatable member mounted in a door and provided with a radial opening and a marked dial, a second member mounted rotatably in the door and adapted to slide toward or from the first-named member, a plate mounted thereon and provided with a tongue, a second plate mounted thereon, and provided with a bolt extension, and a spring holding said member and its connected parts advanced, substantially as described.

2. A permutation-lock, comprising a member consisting of a tubular hub rotatably mounted in a door and provided with a radial opening, a groove and notches, a knob provided with a tubular stem fitting in said hub and having a pin engaging said notches, a marked dial engaging the groove of the hub, and a clamping-bolt clamping said hub and said knob upon the interposed dial, a second member, mounted slidingly and rotatably in the door, and provided with a bolt extension at one side and a sliding plate having a tongue at its opposite side, and a spring holding said second member with the bolt normally advanced, substantially as described.

3. A permutation-lock, comprising a door provided with an elongated opening and with a tongue projecting inwardly of the same at one end, a member rotatably mounted in said opening and provided with a radial opening adapted to register with said tongue, and with peripheral notches in the plane of said radial opening, a ring mounted upon said member and provided with a bolt extension, and a spring holding said member and said bolt normally advanced, substantially as described.



4. A permutation-lock, comprising a member consisting of a tubular hub rotatably mounted in a door and provided with a radial opening, a groove and notches, a knob provided with a tubular stem fitting in said hub and having a pin engaging said notches, a marked dial engaging the groove of the hub, and a clamping-bolt clamping said hub and said knob upon the interposed plate, a second member, mounted rotatably and slidingly in the door and having an opening, and provided with a bolt extension at one side and a sliding plate having a tongue at its opposite side, a spring holding said second member with the bolt normally advanced, and a tongue projecting from the door to prevent the withdrawal of the bolt until it registers with an opening of said sliding member, substantially as described.

5. A permutation-lock, comprising a door provided with an elongated opening and with a tongue projecting inwardly of the same at one end, a member rotatably mounted in said opening and provided with a radial opening adapted to register with said tongue, and with peripheral notches in the plane of said radial opening, a ring mounted upon said member and provided with a bolt extension, a spring holding said member and said bolt normally advanced, and a lever mounted upon the door and provided with a circular opening in which said member is rotatably mounted, substantially as described.

6. A permutation-lock, comprising a door provided with an elongated opening and with a tongue projecting inwardly of the same at one end, a member rotatably mounted in said opening and provided with a radial opening adapted to register with said tongue, and with peripheral notches in the plane of said radial opening, a ring mounted upon said member and provided with a bolt extension, and a spring holding said member and said bolt normally advanced, a second member rotatably mounted in the door and provided with an opening, a marked dial mounted upon each of said members, and a sliding plate mounted upon the first-named member and provided with a tongue adapted to engage the opening of the last-named member, substantially as described.

7. In a permutation-lock, a door provided with a circular opening, an elongated opening, a tongue projecting inwardly of said opening at the end adjacent to the circular opening, and radial marks adjacent to said openings upon its face, a rotatable and slidable member mounted in one opening of the door, and consisting of a hub having a radial opening, a groove, notches and a pin, a knob provided with a tubular extension fitting in said hub and internally threaded, and with a pin engaging said notches, a marked dial-plate having its inner edge engaging said groove, a washer surrounding said stem bearing against the inner end of the hub, a washer bearing against said first-named washer, and a clamping-bolt engaging said stem and said last-named washer so as to clamp the members firmly upon said dial and said pin reliably in said notches, a sliding plate mounted upon said hub and provided with a tongue, a notched washer mounted upon said hub engaging said pin and bearing against said sliding plate, a ring mounted upon said hub and held in place by the first-named washer, and provided with a bolt extension, a second member rotatably mounted in the door and provided with a radial opening and a marked dial, and a spring holding the first-named member yieldingly advanced, substantially as described.

601,976. WAGON-BODY LINING. FRANK H. MURRAY, Salina, Kans. Filed Oct. 29, 1897. Serial No. 656,758. (No model.)

Claim.—1. The herein-described lining for wagon-bodies, composed of flexible material and embodying a bottom, sides and ends, the rear end or tailpiece being secured at its upper portion to the sides and having its lower end loose to form a flap of sufficient length to extend beneath the bottom, substantially as described.

2. A lining or sack for wagon-bodies, composed of flexible material, and comprising a bottom, sides and ends, the sides and ends being of greater height than the height of the wagon-body to form flaps which are of sufficient length to extend over the upper edge of the body and down upon the outside thereof, the outer edges of the flaps being provided with eyelets or holes, substantially as described.

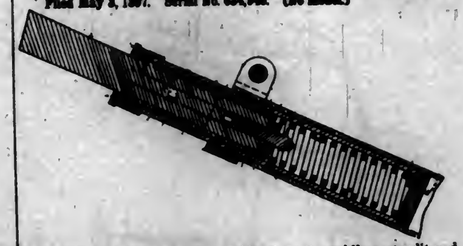
601,977. BICYCLE-CANOPY. CHARLES M. MCDONALD, Italy, N. Y. Filed Oct. 21, 1896. Serial No. 609,564. (No model.)

Claim.—1. A canopy for bicycles, &c., comprising four standards arranged in pairs at the front and rear thereof, a canopy-top removably fitted upon the upper ends of said standards, one or more brackets for securing the forward pair of standards to the head of the machine and permitting their vertical adjustment, and spaced brackets slidingly connected to the rear standards and adapted to be fitted upon the rear or drive wheel axle, substantially as described.

2. In a canopy for bicycles, &c., the combination with the canopy-top, of a pair of standards at the forward end of said top, vertically-spaced brackets adapted to be secured to the head of a bicycle and made of unequal size so as to hold said standards in vertical position, said brackets each consisting of a transverse strip or bar having its opposite ends provided with standard-sockets which hold the standards and admit of their vertical adjustment, a rearwardly-bowed strip or bar, and a clip connected to the central portion of the last-named bar and adapted to embrace the head of the bicycle, substantially as described.

3. An attachment for bicycles, &c., consisting of a pair of brackets spaced apart vertically and connected by suitable braces, said brackets being adapted to be secured to the head of a bicycle and each comprising a transverse strip or bar having sockets at each end, a rearwardly bowed or curved strip or bow attached thereto, and a clip secured to the central portion of said curved bar and adapted to embrace the head of a bicycle, said attachment constituting both a luggage-carrier and a support for the spaced standards of a detachable canopy, substantially as described.

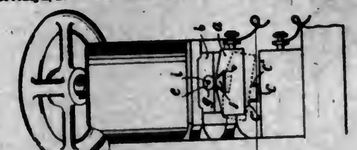
4. In a bicycle-canopy consisting of a top and four supporting-standards, the combination with the rear standards, of attaching devices for securing the standards to the drive-wheel axle, said attaching devices having openings to receive the ends of said axle and means connected to the machine-frame to support the forward standards, substantially as described.



5. In a canopy for bicycles, &c., comprising a top and spaced front and rear standards, the combination with the rear standards, of spaced triangular-shaped brackets each having an opening to receive the drive-wheel axle and also provided with vertically-spaced sockets for the reception of said standards and means connected to the machine-frame to support the forward standards, substantially as described.

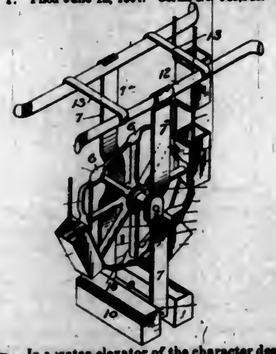
6. In a canopy for bicycles, &c., the combination with a series of standards, of a canopy-top removably fitted upon said standards and comprising cross-bows provided at their extremities with openings for the upper ends of the standards, a fabric covering for said bows, and flexible loops on said covering whereby the latter may be connected to the standards, substantially as described.

7. In a canopy for bicycles, &c., the combination with a series of standards having reduced upper ends, of a canopy-top comprising cross-bows pivotally connected and having their ends apertured to fit over the reduced ends of the standards, a fabric covering for said bows also provided with openings for the upper ends of the standards, a flexible stay extending around said covering, and flexible loops at the corners of the top for engaging pins or hooks on the standards, substantially as described.



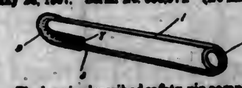
8. In a canopy for bicycles, &c., the combination with a series of standards having reduced upper ends, of a canopy-top comprising cross-bows connected pivotally at their intersection and provided at their extremities with openings, metal reinforcements folded over the ends of said cross-bows and also provided with openings to receive the ends of the standards, and a fabric covering for said bows provided at suitable points with loops for engaging pins or hooks on the standards, the canopy top as a whole being removably fitted upon the standards, substantially as described.

601,978. BICYCLE, &c. HENRY NEVILL, Southampton, England. Filed May 3, 1897. Serial No. 634,946. (No model.)



Claim.—In a bicycle, the combination of a saddle-post split and provided with a screw-threaded opening at its lower end, a bolt to engage said opening, a spring supporting said saddle-post, a casing around said saddle-post, and antifriction-balls located in recesses between the saddle-post and casing, substantially as described.

601,979. ELECTRIC WELDING-MACHINE. CHRISTIAN NIELSEN, Brooklyn, N. Y. Filed June 15, 1897. Serial No. 640,851. (No model.)



Claim.—In an electric welding-machine the combination with the vise comprising a frame, a screw and a sliding block, provided with a circular recess in its center, set in the frame and connected to the screw, of a clamping-jaw, having its top beveled from center to its sides, a dovetail groove in its apex, a pivoting device having a dovetail-shaped base, and a circular head, and of a screw passing through the head of the pivoting device and through the sliding block, and connecting the clamping-jaw to the sliding block of the vise.

601,980. WATER-ELEVATOR. JOHN R. OVERTON, Port Jefferson, N. Y. Filed June 12, 1897. Serial No. 640,548. (No model.)

Claim.—In a water-elevator of the character described, the combination with the sprocket-wheel, the rim of which is composed of alternate reduced and enlarged portions at different distances from the shaft or axle thereof, of the vertical downwardly-depending arms through which the journals of the axle pass, the weight at the lower end thereof having a groove in the upper and lower side, the bars located in said grooves and secured to said arms, the upwardly-extending arms, through which said journals also pass, the horizontal arms secured thereto, the ends of which are curved outwardly, the cross-bars connected with said horizontal bars and the endless chain and buckets, substantially as specified.

601,981. SAFETY-PIN. JOSEPH T. PAYNE, Sweet Springs, Mo. Filed May 26, 1897. Serial No. 638,574. (No model.)

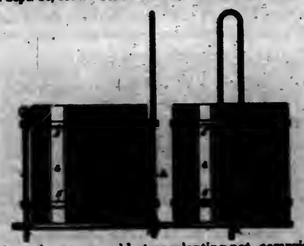
Claim.—The herein-described safety-pin comprising the body portion 1 formed with the loop 6 one of the terminal ends of which is turned upward to form a tooth 7 which is provided with a locking-notch 8 and the other end pointed and provided with an eye 5 adapted to engage said tooth and notch, and the sheet-metal guard secured to the said loop so as to protect the tooth and open on both sides, whereby the pointed end may engage said tooth from either side of the guard, substantially as shown and described.

601,982. WATCHCASE. MARTIN PERRIN, Bristol, Conn. Filed Apr. 13, 1897. Renewed Mar. 4, 1898. Serial No. 672,694. (No model.)

Claim.—In a watch-holding device of the character set forth, the combination of a supporting strap or band provided with two widened portions to extend over the palm and back of the hand, the said portion extending over the back of the hand having a pocket therein, a metallic plate in the said pocket provided with a screw stud or shank, and a watchcase having a screw-opening therein to removably engage the screw stud or shank, and securing devices, substantially as and for the purposes specified.

601,983. FURNACE. ANDREW J. POLVER, Milan, Ohio, assignor of one-half to Homer W. Fisk, same place. Filed May 13, 1897. Serial No. 636,309. (No model.)

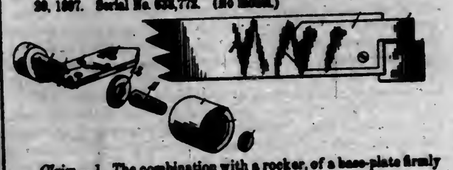
Claim.—1. In a furnace, the combination of intermediate and side bars having end extensions which abut and unitedly form end bars, lugs formed on the inner side of the end extensions of the bars at their extremities and unitedly forming bearings opposite the joints formed between the said extensions, and grate-bars supported at their ends in the said bearings and overlapping the joints formed between the end extensions of the aforesaid bars, substantially as and for the purpose set forth.



2. In a furnace, the combination of an intermediate and side bars, the latter having inner extensions and the former cross-heads at their ends which are connected together, quadrant-shaped lugs formed on the inner side of the cross-heads and inner extensions at their extremities and unitedly providing bearings, and rocking bars journaled at their ends in the said bearings and overlapping the joints formed between the cross-heads and inner extensions, substantially as set forth for the purpose described.

3. In a furnace, the combination of an intermediate and side bars made hollow and having hollow end extensions which are connected together and have the spaces formed therein in communication, the side bars having their spaces extending through the top side and having notches in the top edge of the inner walls, and cap-plates closing the upper side of the spaces and notches in the side bars, substantially as shown for the purpose set forth.

4. In a furnace, a hollow bar having its top side open, and having the side walls connected at intervals by transverse webs, and having notches in the top edge of a side wall, said notches being deeper at their inner ends and contracting toward their extremities and outer discharge ends and inclining rearwardly, and a cap-plate closing the top side of the bar and the said notches, substantially as described.



5. A furnace comprising hollow intermediate and side bars, the latter having inner hollow extensions and the former hollow cross-heads, tie-rods connecting the several bars and extending through the spaces formed within the end extensions thereof, cap-plates closing the spaces of the side bars and notches formed in the top edge of the inner walls thereof, and rocking bars journaled in bearings provided opposite the joints formed between the inner extensions and cross-heads, substantially as shown and described.

601,984. TRANSPLANTER. ROSS T. REASONS, Hopkinsville, Ky. Filed Sept. 16, 1897. Serial No. 651,990. (No model.)

Claim.—A non-separable transplanting-pot, comprising the bottom plate, a handled rod secured thereto, semicylindrical sides pivoted to the rod, and a key-legged retaining-pin therefor, substantially as described.

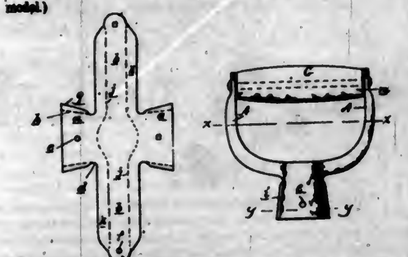
601,985. ROCKER ATTACHMENT. HIRAM P. REED, Addison, N. Y., assignor of one-half to Fred C. Taber, same place. Filed May 20, 1897. Serial No. 638,772. (No model.)

Claim.—1. The combination with a rocker, of a base-plate firmly secured to the lower face of the heel portion of the rocker and projecting beyond the end thereof, an axle extending laterally from the outer end of the plate, a roller provided with a non-abrading cover and journaled on the axle and projecting at one end beyond the outer end of the axle and also beyond the outer vertical face of the rocker, and means to secure the roller on the axle, substantially as described.

2. The combination with a rocker, of a base-plate firmly secured to the lower face of its heel portion and provided with an upwardly and outwardly extending boss projecting beyond the end of the rocker, an axle extending laterally from the boss beyond the plane of the outer vertical face of the rocker, a roller journaled to revolve on said axle, said roller having an unyielding core and a peripheral surface of rubber or similar yielding and non-abrading material which also extends beyond the outer end of the core of the roller, substantially as and for the purpose specified.

601,986. WIRE FENCE. PETER J. SCHILLO, Ionia, Mich. Filed July 22, 1897. Serial No. 645,230. (No model.)

Claim.—1. A wire fabric having intersecting single and two strand members, the two-strand member comprising spaced parts or legs, and ties connecting said members at their points of intersection, each tie consisting of a link having upturned terminal closed loops engaging a single-strand member respectively beyond the opposite edges of the intersecting two-strand member, and having a connecting portion, between said terminal loops, arranged in contact with the two-strand member upon the opposite side from the single-strand member and bowed inwardly between the parts or legs of the two-strand member, substantially as specified.



2. A wire structure having intersecting single and two strand

members, and ties connecting said members at their points of intersection, each tie consisting of an elongated closed link having terminal upturned closed loops engaging a single-strand member respectively beyond the parts or legs of the two-strand member, and having a connecting parallel-sided portion between said terminal loops arranged in contact with, and spanning the interval between, the parts or legs of the two-strand member at the opposite side from the single-strand member and bowed inwardly between said parts or legs, substantially as specified.

3. A fence having runners intersected by a stay provided with spaced parts or legs, and a tie consisting of a link having looped upturned extremities engaging a runner beyond the parts or legs of the stay, the portions of the tie and runner between the parts or legs of the stay being bowed inwardly or toward each other, substantially as specified.

4. A fence having runners intersected by a stay provided with spaced parts or legs, and a tie consisting of an elongated parallel-sided link, having upturned looped extremities engaging a runner beyond the parts or legs of the stay, the connecting portion of the link having its parallel sides arranged to span the interval between the parts or legs of the stay upon the opposite side thereof from the runner, and respectively above and below the plane thereof, and the portions of the runner and the parallel sides of the link, between the parts or legs of the stay, being bowed inwardly or toward each other between said parts or legs of the stay, whereby the bowed portion of the runner lies between the planes of the bowed portions of the sides of the link, substantially as specified.

601,987. SHEET-METAL HANDLE FOR SHOVELS. William Sherray, Detroit, Mich. Filed July 1, 1897. Serial No. 643,014. (No model.)

Claim.—1. The herein-described sheet-metal blank for a shovel-handle being formed with limbs *b* and arms *a* arranged in the form of a cross the limbs having tapering ends terminating in circular ears *f* and the arms being of trapezoidal shape formed with notches *d* at the base.

2. A handle for shovels consisting of a single-piece metal blank having an elongated body portion and oppositely-arranged extensions at the center bent into a socket and united at their edges and the edges of the body portion of the blank beyond the socket being turned back toward each other and the portion beyond the socket being laterally curved, and a grip secured between the ends, substantially as described.

3. As a new article of manufacture, a shovel-handle formed of a sheet-metal blank with a socket and two side bars formed hollow and with closed ends terminating into ears, the edges of the sheet from which the handle is formed forming a flush joint along the center of the outer surface and a hooked seam along the sides of the socket the inner surface being smooth and continuous through the socket and side bars.

4. A shovel-handle formed of a single sheet-metal blank composed of the eared limbs *b* and trapezoidal arms *a*, the limbs *b* being formed into hollow side bars by having like portions along the opposite edges turned over to form a convex outer-wall joint in the center, the inner wall being flat and continuous and the arms *a* being turned over to form each one-half of the vertical wall of the socket, said arms being formed with tapering hooked edges joined into a tapering seam, and a wooden grip-bar secured between the ears of the side bars.

601,988. BOTTLE ATTACHMENT. Albert G. Shalley, Boston, Mass. Filed Aug. 2, 1897. Serial No. 646,822. (No model.)

Claim.—A handle device for bottles, jars, &c., consisting of an upper band attached to the neck and having its ends united to each other and to the upper end of the handle by one soldered joint, and having a second band having its ends united to each other and to the lower end of the handle by a single soldered joint substantially as and for the purpose set forth.

601,988.

601,989. HAT-PIN. Felix Stewart, New York, N. Y. Filed Sept. 7, 1897. Serial No. 650,775. (No model.)

Claim.—1. A hat-pin, comprising a flanged and curved sheath for attachment to head-gear, a pin fitted to slide in the sheath, and an auxiliary pin moving with the sheath-pin and curved in an opposite direction thereto to stand at angles to the sheath to lock or entrap some of the hair of the wearer's head between the auxiliary pin and the sheath when the pin is pushed into the sheath, substantially as shown and described.

2. A hat-pin comprising a flanged and curved sheath for attachment to head-gear, a pin fitted to slide in the sheath and formed at one end with a drop, a handle secured on the drop end of the said pin, and an auxiliary pin secured on the said handle, and curved in an opposite direction to the pin and the sheath to stand at angles to the latter and with its point close to the sheath when the pin is pushed in, substantially as shown and described.

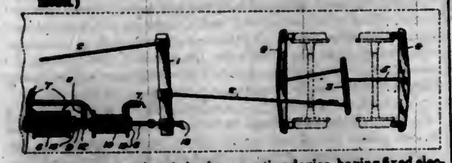
601,990. REMOVABLE SPROCKET-RIM. Robert B. Sutes, Media, Pa. Filed July 14, 1897. Serial No. 644,530. (No model.)

Claim.—1. The combination with the sprocket-wheel, of the removable sprocket-rim, provided with inwardly-extending lugs, formed with holes near their ends, the segmental clamping-plate formed with coinciding holes and the screw bolts and nuts, substantially as described.

2. The combination with the sprocket-wheel, of the removable sprocket-rim formed at the inner side with curved projections corresponding in number with the teeth of the sprocket-wheel and bearing against said wheel between the teeth thereof, the inwardly-extending lugs formed with holes near their ends, the segmental clamping-plate formed with coinciding holes and the screw bolts and nuts, substantially as described.

601,991. GATE. George Van Dusen, New Lisbon, Ind. Filed Jan. 6, 1898. Serial No. 666,896. (No model.)

Claim.—1. The combination of a crane, a horizontal pintle pivotally mounted on the crane and arranged to swing from one side to the other of the same, a gate, a frame or hanger mounted on the horizontal pintle and provided with a vertical pintle carrying the gate, said frame or hanger being adapted to swing on the horizontal pintle to carry the gate over the hanger, substantially as and for the purpose described.



2. The combination of a crane, a horizontal pintle pivotally mounted on the crane, a gate, a frame or hanger mounted on the horizontal pintle and provided with a vertical pintle carrying the gate, said frame or hanger being adapted to swing on the horizontal pintle and being detachably interlocked with the same to hold it normally against such swinging, and a spring for retaining the hanger or frame in engagement with the horizontal pintle, substantially as described.

3. The combination of a crane, a gate, a horizontal pintle provided at its inner end with a block pivoted to the crane and provided with a recess, a vertical pintle receiving the gate and provided with a hanger mounted on the horizontal pintle and engaging the recess of said block, and a coiled spring disposed on the horizontal pintle and holding the hanger in engagement with the recess of the block, substantially as described.

4. The combination of a crane provided with an opening, a vertical pivot arranged at the outer end of the opening, a horizontal pintle provided with a block mounted on the vertical pivot, a hanger mounted on the horizontal pintle and engaging the block, a vertical pintle carried by the hanger, a gate provided with an opening and mounted on the vertical pintle, and a spring for holding the hanger in engagement with the block, substantially as described.

5. The combination of a crane having a horizontal opening, a vertical pivot arranged at the outer end of the opening, a gate having an opening, a horizontal pintle provided at its inner end with a block arranged on the vertical pivot, a substantially Y-shaped hanger provided in its arms with openings receiving the horizontal pintle, a vertical pintle mounted on the stem of the hanger and carrying the gate, and a coiled spring disposed on the horizontal pintle and holding the hanger in engagement with the block, substantially as described.

601,992. ELECTRIC BRAKE-MECHANISM. Alexis Vandenberg, Swanson, Kans. Filed Sept. 13, 1897. Serial No. 651,529. (No model.)

Claim.—1. An electric brake-operating device, having fixed electromagnets, and a movable plunger operating axially through one electromagnet, with its extremities permanently located beyond the ends thereof, for attraction by the other, and adapted to be operatively connected with brake mechanism, substantially as specified.

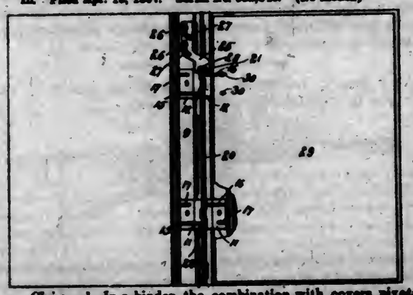
2. An electric brake-operating device having fixed main and auxiliary electromagnets, of relatively different strengths, arranged in alinement, and connected in series, and a movable plunger operating axially through the auxiliary electromagnet, and terminally disposed for attraction by the main electromagnet, the extremities of said plunger being permanently located beyond the ends of the auxiliary electromagnet, and one of them being adapted for connection with a brake mechanism, substantially as specified.

3. An electric brake-operating device, having a magnet provided with contiguous spaced poles, and a polarized plunger terminally disposed between the poles of said magnet and adapted to be operatively connected with the moving parts of a brake mechanism, substantially as specified.

4. An electric brake-operating device, having a "club-foot" electromagnet constructed with the extremity of its unwound leg contiguous to and in alinement with the wound leg, and a polarized plunger terminally disposed between the poles of said magnet for relative attraction and repulsion thereby, and adapted to be operatively connected with the moving parts of a brake mechanism, substantially as specified.

5. An electric brake-operating device having a main "club-foot" electromagnet provided with a terminally-bifurcated bare leg arranged contiguous to and in alinement with its wound leg, and an auxiliary electromagnet axially alined with the wound leg of the main magnet, and having an axially-movable core terminally arranged between the poles of the main magnet and permanently out of contact with the like pole, substantially as specified.

601,993. METHOD OF MANUFACTURING CASKS OR BARRELS FROM VENEERS. Carl Wittgowsky, Berlin, Germany. Filed May 27, 1897. Serial No. 638,326. (No model.) Patented in Germany Dec. 3, 1895, No. 85,451; in Hungary Feb. 3, 1896, No. 5,903; in France Feb. 5, 1896, No. 253,735; in Belgium Feb. 10, 1896, No. 119,702; and in Austria Sept. 18, 1896, No. 3,560.



Claim.—1. The method of manufacturing veneer mantles for barrels and casks, consisting in uniting at least two veneers having the same direction of grains, with at least one veneer arranged between said two and having its grain running perpendicular to the grains of said two former veneers, subjecting the veneer plate thus formed after its having been united and dried to the action of a jet of steam, and finally bending the said plate under heat and pressure, in such a manner, that the grains of the said two former veneers run around the mantle, for the purpose as described.

2. The method of manufacturing veneer mantles for barrels and casks, consisting in uniting at least two veneers having the same direction of grains, with at least one veneer arranged between said two and having its grain running perpendicular to the grains of said two former veneers; moistening the veneer plate thus formed, after its having been united and dried, subjecting the said plate to the action of a jet of steam, and finally bending it under heat and pressure, in such a manner, that the grains of the said two former veneers run around the mantle, for the purpose as described.

3. The method of manufacturing veneer mantles for barrels and casks, consisting in uniting in a curved state at least two veneers having the same direction of grains, with at least one veneer arranged between said two and having its grain running perpendicular to the grains of said two former ones; moistening the curved veneer board thus formed, subjecting it to the action of a jet of steam, and finally bending it under heat and pressure, in such a manner, that the grains of the said two former veneers run around the mantle, for the purpose as described.

601,994. TEMPORARY BINDER. John R. Barrett, Chicago, Ill. Filed Apr. 10, 1897. Serial No. 632,840. (No model.)

Claim.—1. In a binder, the combination with covers pivotally connected together, of retaining-hooks carried by and moving with each of said covers when said covers open and close, the hooks of the two covers being arranged to normally overlap both when the covers are open and when they are closed, and a rod forming the hinge-pin and having its ends connected with the hinge of said covers at opposite sides, said rod being movable longitudinally to disengage one of its ends from said hinge, substantially as described.

2. In a binder, the combination with hinged back members, and normally-overlapping retaining-hooks carried thereby, of a rod forming the hinge-pin and having its ends connected with the hinge at opposite sides, said rod being movable longitudinally, whereby it may be thrown into and out of operative position, substantially as and for the purpose specified.

3. In a binder, the combination with back members, and hinges connecting said back members, said hinges having recesses 23 24, of a torsion-spring having its ends fitted in said recesses, substantially as described.

4. In a binder, the combination with back members, and hinges connecting said back members, said hinges having recesses 23 24, of a torsion-spring having its ends fitted in said recesses, said spring being movable to cause one end thereof to move out of its recess, substantially as and for the purpose specified.

5. In a binder, the combination with back members hinged together, of retaining-hooks carried thereby, and binder-sheets adapted to be threaded upon said hooks, said binder-sheets having perforations, the outer portions of said perforations being of less diameter than the mean diameter of said retaining-hooks, substantially as described.

6. In a binder, the combination with back members hinged together, of retaining-hooks carried thereby, and binder-sheets adapted to be threaded upon said hooks, said sheets having oval perforations to receive said hooks, substantially as described.

7. In a binder, the combination with back members hinged together, and normally-overlapping retaining-hooks carried thereby, of a spring for preventing accidental excessive opening of said back members, and a locking device for locking back said back members when bent back to expose the ends of said retaining-hooks, substantially as described.

8. In a binder, the combination with back members hinged together, and normally-overlapping retaining-hooks carried thereby, of a spring for preventing accidental excessive opening of said back members, and a locking device consisting of a sliding plate adapted to engage the hinge of the back members to lock said members back to expose the ends of the retaining-hooks, substantially as described.

9. In a binder, the combination with back members hinged together and normally-overlapping retaining-hooks carried thereby, of a spring for preventing accidental excessive opening of said back members, and a locking device consisting of a sliding plate adapted to engage the hinge of the back members to lock said members back to expose the ends of the retaining-hooks, said plate having inclined grooves 27, substantially as described.

601,995. ALBUMEN PREPARATION SOLUBLE IN WATER.

FELIX BAUER, Berlin, and ALBERT BAUER, Elberfeld, Germany, assignors to Bauer & Cie., Berlin, Germany. Filed Mar. 1, 1898. Serial No. 672,163. (No specimens.)

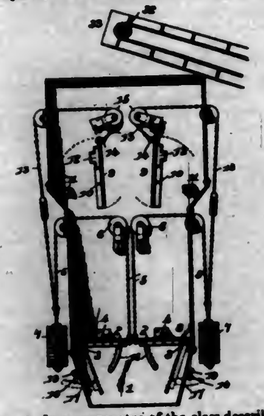
Claim.—1. The process for manufacturing albumen preparations soluble in water from glycerophosphates and albumicoids (albuminates, casein of milk and vegetable casein), consisting in mixing the albuminoids suspended in an inactive liquid with the quantities of glycerophosphates necessary for solution, in heating the mixture, in eliminating the water, and in drying the product, substantially as set forth.

2. The within-described water-soluble albumicoid product containing glycerophosphate of soda, and obtained as set forth, in the form of a powder, white in color, without smell and taste, absorbing cold water readily and dissolving by heat into a milky liquor, substantially as described.

601,996. DEHORNER.

ERNEST A. BULLOCK, Elba, Mich. Filed Feb. 18, 1897. Serial No. 624,031. (No model.)

Claim.—1. A dehorner comprising a stock, oppositely-curved cutters applied to the same side of the stock, the one being pivoted and the other adjustable by means of independent adjusting and securing devices, an operating-lever pivoted between its ends to the same side of the stock provided with the cutters, and a loose connection between the pivoted cutter and the operating-lever, substantially as set forth.



2. In a dehorner, the combination of a pivoted cutter, a second cutter having a stem and a bracing-shoulder at the base of the stem, a wedge interposed between the shouldered end of the adjustable cutter and its support, and means applied to the stem for securing the adjustable cutter in the required position, substantially as specified.

3. In a dehorner, a stock having an arch between its ends, co-operating cutters at one side of the arch, one of the cutters being pivoted to the stock at one end of the arch, and an operating-lever fulcrumed to the stock at the opposite side of the arch and having connection with the pivoted cutter, the arch affording clearance for the inner end of the said lever, substantially as specified.

4. A dehorner comprising a bar having a portion between its ends bent to provide an arch, a cutter pivoted to the bar at one end of the arch, a second cutter having a threaded stem passing through an opening in the bar and having a bracing-shoulder at the base of the stem, a slotted wedge interposed between the shouldered end of the adjustable cutter and the bar for properly positioning the cutter, securing means applied to the stem of the adjustable cutter for holding it in place, an operating-lever fulcrumed to a stud provided on the bar at the opposite side of the arch, a link connecting the inner end of the lever with the pivoted cutter, and a stop for limiting the inner movement of the lever, substantially as set forth.

601,997. AUTOMATIC SCALE FOR MEASURING MATERIAL IN BULK.

PRESTE B. CLARKE, Mobile, Ala. Filed May 20, 1896. Renewed Sept. 17, 1897. Serial No. 652,075. (No model.)

Claim.—1. In an apparatus of the class described, the combination of a scale-chute, a scale-gate hingedly mounted in the chute and arranged to swing downward in opening, a pivotally-mounted cut-off gate arranged in the chute and located above the scale-gate and provided with a weight for closing it, a weight 7, a chain or cable having one end connected to the weight, and its other end connected with the scale-gate, and a cable or chain 13 having one end attached to the cut-off gate and the other end attached to the weight 7, and capable of holding the cut-off gate open when the scale-gate is closed and adapted to be slackened when the weight 7 rises through the opening of the scale-gate, whereby the cut-off gate is permitted to close automatically, substantially as described.

2. In an apparatus of the class described, the combination of a scale-chute, scale-gates hinged at their outer ends to the chute and located within the same, weights located outside of the chute, the chains 5 having their outer ends attached to said weights, and their inner ends secured to the free ends of the scale-gates and passing over guide-pulleys located above the gates, the cut-off gates arranged within the chute and pivoted intermediate of their ends and provided with counterweights for closing them, and the chains 13 connected with the cut-off gates and passing over suitable guide-pulleys, and connected with the first-mentioned weights, substantially as and for the purpose described.

3. In an apparatus of the class described, the combination of a scale-chute, hingedly-mounted scale-gates arranged within the chute and connected at their outer ends with the same, ratchet-bars mounted on the free ends of the scale-gates, pawls mounted in the chute and arranged to engage the ratchet-bars automatically for locking the scale-gates in their open position, weights connected with the scale-gates for holding the same normally in a horizontal position, and connections between the weights and the pawls, whereby the latter are disengaged from the ratchet-bars after a limited engagement, substantially as described.

4. In an apparatus of the class described, the combination of a scale-chute, the hingedly-mounted downwardly-swinging scale-gates arranged within the chute, weights connected with the scale-gates for holding the same normally closed, ratchet-bars depending from the scale-gates, rock-shafts provided with pawls to engage the ratchet-bars and having arms, a slide arranged beneath and adapted to engage the arms of the rock-shafts to release the gates, mechanism for actuating the slide, and connections between the weights and such actuating mechanism, whereby the latter is set in operation when the gates are opened, substantially as described.

5. In an apparatus of the class described, the combination of a scale-chute, swinging gates arranged within the same, weights connected with the gates for holding the same normally closed, ratchets carried by the gates, pawls mounted on the chute for engaging the ratchet-bar for holding the gates open, a continuously-rotating wheel, a shaft carrying a wheel and capable of a limited movement for enabling its wheel to be carried into and out of engagement with the continuously-rotating wheel, a pulley or drum mounted on the shaft, a chain secured to and adapted to be wound around the drum and connected with the pawls and adapted to withdraw the same from their engagement, and connections between the shaft and the weights, whereby the said wheels are caused to engage or mesh with each other when the gates are opened, substantially as described.

6. In an apparatus of the class described, the combination of a scale-chute, hingedly-mounted gates arranged within the chute, weights connected with the gates for holding the same normally closed, ratchets carried by the gates, pawls mounted on the chute for engaging the ratchets, rock-shafts carrying said pawls and provided with arms, a slide having a limited movement and arranged to engage the arms, a continuously-rotating wheel, a shaft carrying a wheel for meshing or engaging with the continuously-rotating wheel and provided with a pulley or drum, a spring connected with the shaft and adapted to hold the said wheels in engagement, a chain secured to the pulley or drum and adapted to be wound thereon and connected with said slide, and connections between the shaft and the weights, whereby the spring is permitted to engage the said wheels, substantially is described.

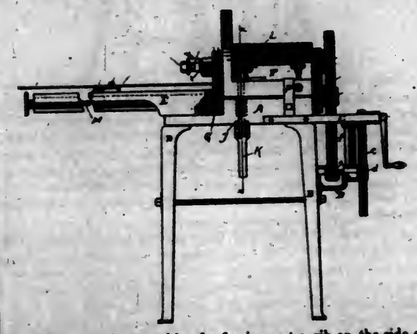
7. In an apparatus of the class described, the combination of a scale-chute, scale-gates arranged within the chute and hinged at their outer ends to the same, rack-bars depending from the free inner ends of the scale-gates, pawls mounted on the chute and located below the hinges of the scale-gate and arranged to engage the rack-bars automatically for locking the scale-gates in their open position, weights connected with the scale-gates for holding the same normally closed, and means for disengaging the pawls from the rack-bars to permit the weights to close the gates, substantially as described.

8. In an apparatus of the class described, the combination of a scale-chute, a conveyor provided with a continuously-rotating wheel, a scale-gate arranged within the chute, a locking device for holding the scale-gate in its open position, a wheel intermittently contacting with the continuously-rotating wheel and operated by the same, a cable or chain connected at one end with the intermittently-rotating wheel and adapted to be wound up by the same, and having its outer end connected with the locking device, whereby the latter is tripped to release the gate, and means for moving the intermittently-rotating wheel into and out of contact with the continuously-rotating wheel, substantially as described.

9. In an apparatus of the class described, the combination of a scale-chute, a scale-gate hinged in the chute, a locking device for holding the scale-gate open, a weight connected with the scale-gate and adapted to close the same, a continuously-rotating wheel, an intermittently-rotating wheel adapted to be moved into and out of contact with the continuously-rotating wheel, a chain or cable connected at one end with the intermittently-rotating wheel and adapted to be wound by the same, and having its other end connected with the locking device and adapted to trip the same to release the gate, and connections between the weight and the intermittently-rotating wheel, whereby the latter is moved into and out of contact with the continuously-rotating wheel when the gate is open and is drawn out of contact when the gate is closed, substantially as described.

601,998. FASTENING DEVICE.

ALFRED CURRIER, Grand Rapids, Mich., assignor of one-half to William Powers Putnam, same place. Filed June 25, 1897. Serial No. 642,265. (No model.)

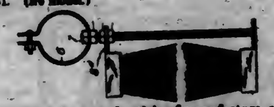


Claim.—1. In combination, the tubing, the cylindrical plug inserted therein having a plain face at right angles to the axis of the tube, the dished washer having its concave side in proximity to said plain face, the bolt passing through the washer and plug and having a head bearing against the convex side of the washer, and the threaded member engaging the threaded end of the bolt and adapted to draw the same up to straighten the concave washer, substantially as described.

2. In combination, the tube, the split cylindrical block, the dished washer abutting against the face of the block, the bolt passing through the washer and block and having a wedge-shaped portion operating in conjunction with the split portion of the block, and having also a head bearing against the convex side of the washer, and means threaded upon the end of the bolt for drawing upon it to spread the block and straighten the washer, substantially as described.

601,999. SAW-TOOTH-RIBBING MACHINE.

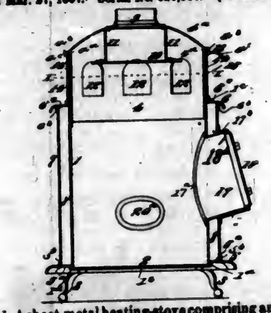
CHARLES H. DOUGLAS, Chicago, Ill. Filed May 20, 1897. Serial No. 638,317. (No model.)



Claim.—1. In a machine for forcing out a rib on the side of a saw-tooth, the combination with a main frame, of shafts mounted thereon parallel or nearly so with each other, rolls of the required form attached to said shafts, mechanism to rotate them in unison with each other, mechanism to adjust them the required distance from each other, and a device to open and close the said rolls in relation to each other without altering the adjustment, as and for the purpose specified.

2. In a saw-tooth-ribbing machine, the combination with a main frame, of two pieces of metal mounted thereon on which there are curved surfaces of the form required for ribbing saw-teeth, mechanism to move said curved surfaces in unison with each other, mechanism to adjust said curved surfaces the proper distance from each other to act as desired upon a saw-tooth, and a device that will permit one tooth to be acted upon and another tooth to escape action while ribbing a saw, substantially as specified.

3. In a saw-tooth-ribbing machine, the combination with a main frame, of a piece of metal mounted thereon on which there is a curved surface of the required form for ribbing a saw-tooth when said tooth is passed between it and another metal surface of the required form, mechanism to adjust said curved surface and the corresponding surface in the required relation to each other to rib a saw-tooth, and means to cause said curved surface to act on alternate teeth, as specified.

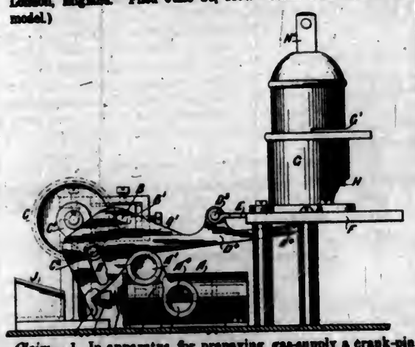


602,000. AUTOMATIC CHAIN-CLEANING DEVICE FOR BICYCLES.

BOOKER FAY, Denver, Colo. Filed Nov. 5, 1896. Serial No. 611,181. (No model.)

Claim.—As an improved article of manufacture, a chain-cleaning device for bicycles comprising a vertical stem having its upper extremity threaded, a clamp attached to the upper extremity of the stem, a horizontal shoe or holder whose body part is composed of flanges bent to form an open-ended, dovetailed receptacle, said shoe having a projection apertured to receive the threaded portion of the stem, lock-nuts applied to the stem and engaging the apertured projection of the shoe on opposite surfaces, whereby the said shoe is vertically adjustable on the stem, a block inserted in the dovetailed receptacle of the shoe and having a depending brush, said block being detachable, a similar shoe made fast to the lower extremity of the stem, a detachable block inserted in said shoe and provided with an upwardly-projecting brush, the two brushes being adapted to engage the opposite surfaces of the chain when the device is in place on the bicycle, as and for the purpose set forth.

602,001. HEATING-STOVE. CHARLES L. FELSUNG, Clay City, Ill. Filed Mar. 27, 1897. Serial No. 630,580. (No model.)



Claim.—1. A sheet-metal heating-stove comprising an inner casing formed with an outturned and inturned lower end providing a bead, and with an outturned upper flange, the imperforate bottom supported on the inturned portion of the lower end of the inner casing, the lower ring fitting around the inner casing and seating on the bead, the outer casing supported on the lower ring and providing an air-chamber in connection with the inner casing and the upper ring supported on the outer casing and supporting the inner casing thereon; substantially as described.

2. A sheet-metal heating-stove comprising an inner casing, the lower ring fitting around the inner casing, the outer casing supported on the lower ring, the upper ring supported on the outer casing and supporting the inner casing thereon, and the removable top consisting of the dome-shaped upper end formed with a bead, with an inturned flange at its lower edge and with a central flue-opening, the lower portion formed with an outturned flange supported on the inturned flange of the upper end, and the surrounding band fitting beneath the inturned flange and supporting the top upon the inner casing; substantially as described.

3. A sheet metal heating-stove comprising an inner casing, the lower ring fitting around the inner casing, the outer casing supported on the lower ring, the upper ring supported on the outer casing and supporting the inner casing thereon, a tube extending through the casings formed with a flange whereby it is secured to the inner casing, and a flanged collar whereby the tube is secured to the outer casing; substantially as described.

602,002. PREPAID-GAS-SUPPLY METER. JOHN D. FORSTER, London, England. Filed June 21, 1897. Serial No. 641,022. (No model.)

Claim.—1. In apparatus for prepaying gas-supply a crank-pin, revolved by the index mechanism of a meter, a bar, operated by the crank-pin, a projection on the bar acting to open and close a gas-supply pipe from the main to the meter, trunnions on the bar pivoted on a delivery-slide of coin-controlled mechanism and an extension of the bar by which the latter may be rocked to open the valve and allow the meter mechanism to act, such rocking of the bar being effected by a plunger through the medium of an inserted coin, substantially as and for the purposes described.

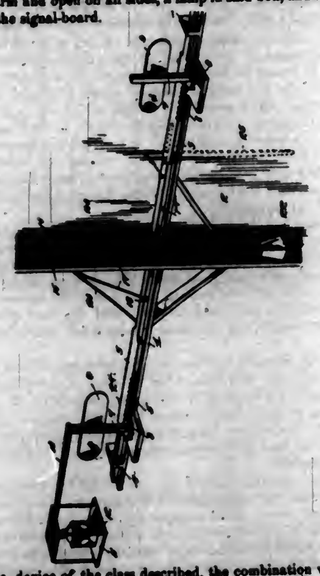
2. In a prepayment mechanism for gas-supply, the combination with a coin-receptacle; a plunger working in said receptacle; a delivery-slide also working in said receptacle; a rocking bar pivoted to said delivery slide; a crank pin revolved by the index mechanism of the meter and connected to said bar for operating the latter; means operated by said bar to open and close a gas-supply pipe; and a projection on said bar adapted to be operated by said plunger through the medium of an inserted coin, substantially as described.

3. In a prepayment mechanism for gas-supply, the combination with a coin-receptacle; a plunger working in said receptacle; a slotted guide-plate beneath said receptacle; a delivery-slide working upon said guide-plate; a rocking bar pivoted to said delivery-slide; a crank-pin revolved by the index mechanism of the meter and connected to said rocking bar for operating the latter, means operated by said bar to open and close a gas-supply pipe; and an extension on said bar adapted to be operated by said plunger through the medium of an inserted coin, substantially as described.

4. In a prepayment mechanism for gas-supply, the combination with a coin-receptacle; a piston working in said receptacle; a delivery-slide also working in said receptacle; a rocking bar pivoted to said delivery-slide; a crank-pin revolved by the index mechanism of the meter and connected to said bar for operating the latter; a spring-plunger connected to a valve in the gas-main, normally holding said valve open; a projection on said rocking bar adapted to strike said valve-plunger and close said valve when at rest; and an extension on said bar adapted to be operated by said piston through the medium of an inserted coin, substantially as described.

5. In a prepayment mechanism for gas-supply, the combination with a coin-receptacle; a piston working in said receptacle; a slotted guide-plate beneath said receptacle; a delivery-slide working upon said guide plate; a rocking bar pivoted to said delivery-slide; a crank-pin revolved by the index mechanism of the meter and connected to said rocking bar for operating the latter; a spring-plunger connected to a valve in the gas-main normally holding said valve open; a projection on said rocking bar adapted to strike said valve-plunger and close said valve when at rest; and an extension on said rocking bar adapted to be operated by said piston through the medium of an inserted coin, substantially as described.

602,003. BACK-BAND FOR HARNESS. JOHN A. PRESWELL, Buford, Ga. Filed July 3, 1897. Serial No. 643,267. (No model.)



Claim.—1 In a back-band for harness, the combination with a strap having its ends folded upon itself and adjustably connected together midway the length of the folded strap; of a plurality of rounded blocks provided with openings therethrough for the passage of said folded strap, fitted thereon upon each side of its middle portion; one of said blocks on each side being secured to a stationary portion of said strap; and devices connected to the folded ends of said strap for attaching the same to a pair of traces, substantially as described.

2. In a back-band for harness, the combination with a strap having its ends folded upon itself and adjustably connected together midway the length of the folded strap; of a plurality of blocks having rounded inner faces, provided with openings therethrough near the outer faces for the passage of said folded strap, fitted upon said folded strap upon each side of its middle portion; one of said blocks on each side being secured to a stationary portion of said strap; the end block on each side having a thin lower extension thereon; and devices connected to the folded ends of said strap, and hanging alongside of the extensions on said end blocks, adapted to engage a pair of traces, substantially as described.

3. In a back-band for harness, the combination with a strap having an adjustable connection midway of its length; of a plurality of rounded blocks provided with openings therethrough for said strap, fitted thereon upon each side of said adjustable connection, one of such blocks on each side of said connection being secured to said strap; and devices carried by the ends of said strap for detachably connecting the same to a pair of traces, substantially as described.

602,004. RAILWAY-SIGNAL. GEORGE W. GREEN, South McAlester, Ind. Ter. Filed June 16, 1897. Serial No. 640,193. (No model.)

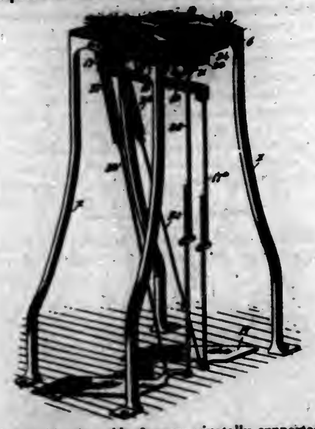
Claim.—1. In a device of the class described, the combination with a rotary signal-board, of a signal-lamp box carried thereby on a swinging arm and open on all sides, a lamp in said box, and means for turning the signal-board.

2. In a device of the class described, the combination with an outer rotary signal-board, of a similar inner rotary signal-board, a shifting rack-bar and pinions affording an operative connection between the two signal-boards, and means for moving said bar, substantially as described.

3. In a device of the class described, the combination with a signal, of a sliding rack-bar and pinion for operating the same, a pull-cord connected to the sliding bar and used for operating the same in one direction, and a second cord also connected to the bar and adapted for moving it in the other direction.

4. In a device of the class described, the combination with a movable signal, of a shifting rack-bar and pinion for operating the same, pulleys, a pull-cord connected to the shifting bar and running over one pulley, a third pulley, carried on the support for the shifting bar and a cord running over the last-named pulley and the remaining pulley of those aforesaid, and having one end connected to the shifting bar.

5. In a device of the character described, the combination with a movable signal located in the path of a moving vehicle and designed to be operated thereby, of a flexible piece operatively connected with said signal, and a weight secured to said piece and designed to retain the signal in one position, and mechanism for moving the signal in opposition to the weight, substantially as specified.



6. In a device of the class described, the combination with an upright spindle and a signal-board and a signal-arm overhanging the track and carried by said spindle, of a pinion secured to the spindle, a shifting bar having a rack engaging with the pinion, a pull-cord connected to the shifting bar and adapted to move the same in one direction, and a second pull-cord connected to the said bar and adapted to move it in the opposite direction.

602,005. HEEL-BUILDING MACHINE. ELMER S. GOSS, Ellsworth, Me., assignor to J. H. Hopkins, same place. Filed Jan. 18, 1897. Serial No. 619,868. (No model.)

Claim.—1. In a heel-building machine, the combination of a reciprocating head, a rear former having adjustable connection therewith, side formers, movable connections between the side formers and the said reciprocating head, means for relatively adjusting the side formers and movable connections, and adjustable stops to engage with the side formers as they are advanced and simultaneously move them inward, substantially as set forth.

2. In a heel-building machine, the combination of side formers pivotally supported intermediate of their ends, and adjusting means operating upon the side formers upon opposite sides of their pivotal supports, substantially in the manner and for the purpose set forth.

3. In a heel-building machine, the combination with side formers, of curved arms pivotally supported and adapted to engage with the formers to one side of their support, and set-screws for adjusting the said arms to vary the position of the formers, substantially as and for the purpose set forth.

4. In combination, side formers pivotally supported, and set-screws for turning the formers upon their pivotal supports, substantially as and for the purpose set forth.

5. In a heel-building machine, the combination of pivoted arms bearing oppositely-disposed formers, a bow-spring for spreading the arms, at their free ends and normally holding the formers separated, headed fastenings passing through slots at the extremities of the bow-spring and loosely and positively connecting them with the pivoted arms, substantially in the manner set forth.

6. In combination, a reciprocating head, arms having connection with the head, formers pivotally attached to the arms, and adjustable stops to engage with the formers to bring them together during a travel or movement of the head, substantially as and for the purpose set forth.

7. In combination, a reciprocating head, arms having pivotal connection with the head, formers pivotally attached to the arms, means as set-screws, for adjusting the formers with respect to their carrying-arms, and adjustable stops to engage with the formers to cause them to grip the heel when moving the said head forward, substantially as described.

8. In a heel-building machine, the combination of a reciprocating head, arms movable with the head and bearing side formers, adjustable stops for causing the formers to grip the heel, and a rear former having adjustable connection with the said reciprocating head, substantially as and for the purpose set forth.

9. In a heel-building machine, the combination with a bed and formers, of a lever bearing a gage to cooperate with the formers to provide a heel-space, said gage being movable with the lever to a point below the bed, substantially as and for the purpose set forth.

10. In a heel-building machine, the combination with a bed, and formers, of a lever, and a gage having adjustable connection with the lever and movable with the latter to a point below the bed so as to admit of the ready removal of the completed heel, substantially as described.

11. In combination, a bed, a reciprocating head, a rear former having adjustable connection with the head, arms pivotally attached to the said reciprocating head, a spring for holding the arms separated at their free ends, side formers pivotally attached to the arms, set-screws interposed between the side formers and their arms, other arms pivoted to the bed and bearing antifriction-rollers to engage with the front ends of the side formers, set-screws for adjusting the last-mentioned arms, a vertically-adjustable gage, and actuating mechanism for the gage and reciprocating head, substantially as set forth.

602,006. NIGHT-ROBE. JOHN GRIMDT, Jersey City, N. J. Filed Nov. 17, 1897. Serial No. 658,890. (No model.)

Claim.—1. As an article of manufacture, a garment of the class described, having a front and rear breadth of material, a flap 10 formed by extending the material of one of the breadths beyond its lower edge, said flap being bent over and extended upwardly in front of said breadth, and secured thereto at its side edges, and at its upper edge at a point between said side edges, so as to leave unobstructed openings 16 leading into the interior of said pouch, substantially as described.

2. As an article of manufacture, a garment of the class described,

having front and rear breadths of material, a flap secured to one of said breadths at the bottom and sides, and at the top at a point intermediate of the sides, and an extension from the top of the flap extending down between the said flap and breadth, substantially as described.

602,007. WITHDRAWN.

602,008. MOVING WAY OR STAIR FOR TRANSPORTING PERSONS AND GOODS. JACQUES HALLÉ, Paris, France. Filed Nov. 3, 1897. Serial No. 657,305. (No model.) Patented in France Apr. 5, 1897, No. 265,663.

Claim.—1. A movable inclined way or stair formed in two sections with a landing interposed between said sections, and having an endless flexible apron or belt common to both sections, the first section of said apron rising to a point with its tread-surface on a level with the plane of the landing, means for deflecting the apron under said landing to the second section, and means for driving the apron, substantially as described.

2. In a movable inclined way or stair, a plurality of sections with a landing interposed between the same, a flexible apron or belt common to both sections and running over suitable rollers at the ends of the sections, a roller beneath the landing under which the apron runs and whereby it is deflected under the landing to the succeeding section, and means for driving the belt, substantially as described.

3. In a movable inclined way or stair, the combination with an apron or belt, of a movable hand-rail sliding on a fixed bar extending longitudinally therewith at the side of the way, and means for driving the apron and hand-rail, substantially as described.

4. In a movable inclined way or stair, the combination with an apron or belt, of an endless hand-rail running over suitable drums and sliding on a fixed bar extending longitudinally therewith at the side of the way, and means for driving the apron and hand-rail, substantially as described.

5. In a movable inclined way or stair, the combination with an apron or belt, of an endless flexible hand-rail running over drums at the ends of said way, a fixed bar arranged at one side of the way between said rollers and along which the upper part of the hand-rail slides, a shield or cover over the lower part of the hand-rail projecting downwardly into close proximity with the edge of the apron, and means for driving the apron and hand-rail, substantially as described.

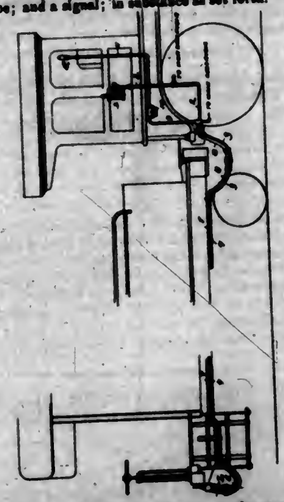
6. In a movable inclined way, the combination with the tread portion and a movable hand-rail, of an incline K extending along the inner edge of the hand-rail at the exit end of the way, its upper edge extending upwardly from the plane of the hand-rail to a point above the same, whereby the hand of a person being transported by the way is lifted from the hand-rail upon arriving at the exit end of the way, as set forth.

7. In a movable inclined way or stair for the transport of persons or goods, the combination of a continuous apron consisting of thin leather strips secured together and running over drums D D', of which one is a driving-drum and drawn by frictional contact the upper length of the apron which serves as a moving path, while the other drum serves as a stretching-drum, the upper length of the apron being supported by rollers arranged at intervals thereunder, with a continuous flexible and separate hand-rail F F' driven from the apron and moving at the same speed therewith, said hand-rail running over two drums G G' of which one is a stretching-drum and the other a driving-drum, a fixed bar H on the upper winged edge of which the hand-rail slides running from one drum to the other and supported on uprights, panels between said uprights, and inclined plinths e e' extending downwardly into proximity with the upper surface of the edge of the apron, substantially as described.

8. In a movable way or stair of the kind referred to, ramps or inclines K K which are connected to boxes inclosing the moving parts, and which are smooth, curved, and turned up in such a manner as, at the end of the travel, to raise the wrists of the passengers, while their feet move forward and slide upon the fixed flooring, substantially as described.

9. In a moving way or stair of the kind referred to, the arrangement of two or more lifts, placed one behind another, each having a separate hand-rail, but being served by the same apron, which is deflected under each landing E by means of a roller L, substantially as described.

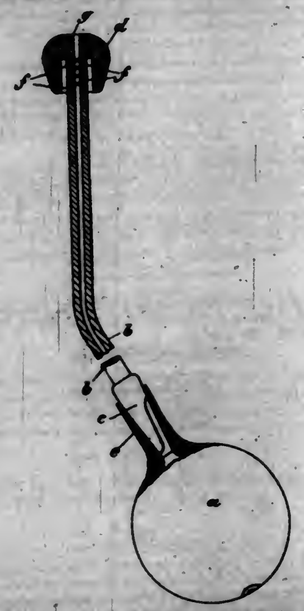
602,009. MEANS FOR TESTING FLUID-PRESSURE SYSTEMS. GEORGE S. HOBURN, Windsor, Canada. Filed Mar. 26, 1894. Serial No. 505,206. (No model.)



Claim.—1. The combination with two fluid-pressure pipe-lines and a signal, of testing mechanism operatively connected thereto, such mechanism being arranged to operate by a variation of fluid-pressure in one pipe to vary the fluid-pressure in the other, and thereby operate the signal; substantially as described.

2. The combination with two fluid-pressure pipe-lines extending from the locomotive throughout the length of the train, and a signal, of testing mechanism operatively connected thereto, such mechanism being arranged to operate by a variation of fluid-pressure in one pipe to vary the fluid-pressure in the other, and thereby operate a signal; substantially as described.

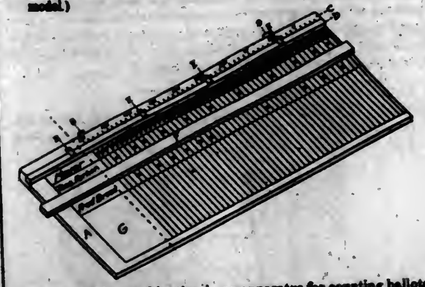
3. The combination with two fluid-pressure pipe-lines on a railway-train, one of them being an air-brake pipe-line, and a signal, of testing mechanism operatively connected thereto, such mechanism being arranged to operate by a variation of fluid-pressure in one pipe to vary the fluid-pressure in the other, and thereby operate the signal; substantially as described.



4. The combination with two fluid-pressure pipe-lines, means for varying the pressure at one end of said pipe-lines, and a signal, of testing mechanism operatively connected thereto, such mechanism being arranged to operate by a variation of fluid-pressure in one pipe to vary the fluid-pressure in the other, and thereby operate the signal; substantially as described.

5. The apparatus for testing the air-brake and signal systems, consisting of the following elements in combination, to wit: a train-pipe; a signal-pipe; a proving-valve; means for discharging air from the train-pipe; and a signal; in substance as set forth.

6. A proving-valve having fluid-pressure pipe-couplings, one of which communicates with a chamber in a valve-casing, a piston in said chamber, and said piston controlling an opening from a second chamber which communicates with the other pipe-coupling; substantially as described.



602,010. INSUFFLATOR. ALEXANDER HOSSEA, Berlin, Germany. Filed June 12, 1897. Serial No. 640,867. (No model.)

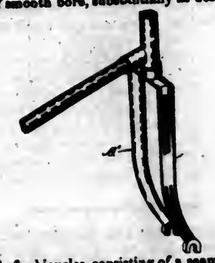
Claim.—1. As a means for introducing pulverulent substances into cavities of the bodies of men or animals, and distributing or dispersing them within said cavities the combination with a compressible ball and a pipe extending from the same, of a mushroom-like head secured to the free end of said pipe without closing the bore of the same, and having in its rear part a space opening to the rear side of the head, and surpassing in diameter the diameter of the pipe; the part of the latter located within said space having holes putting the bore of the pipe in communication with the said space, as set forth.

2. As a means for introducing pulverulent substances into cavities of the bodies of men or animals, and distributing or dispersing them within said cavities, the combination with a compressible ball having a tube-like extension with a bore widening from its inner end to its outer one, and with a pipe having a shovel-like end piece of conical shape adapted to take into, and be connected with, said tube-like extension of the ball, of a mushroom-like head secured to the free end of said pipe, and having in its rear part a space opening to the rear side of the head and surpassing in diameter the diameter of the pipe; the part of the latter located within said space having holes putting the bore of the pipe in communication with the said space, as set forth.

602,011. APPARATUS FOR COUNTING BALLOTS. FRANK B. HOLT, Lynn, Mass. Filed Feb. 21, 1896. Serial No. 580,236. (No model.)

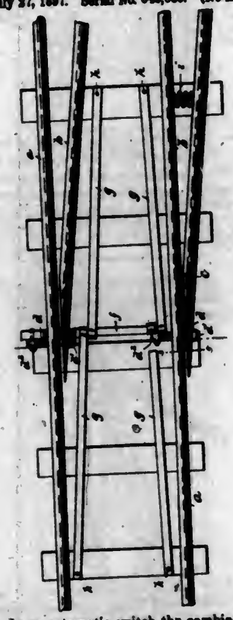
Claim.—The combination in an apparatus for counting ballots of the straight-edge F, the board A having upon one side springs B B, the clamp C, held in position by said springs, said clamp C, having upon its upper surface marks placed at regular distances from each other to show the proper place for each ballot, and also buttons E, E, E, E, and the follower D, for the purpose specified, all substantially as described.

602,012. FORK SIDE FOR BICYCLES. ELLWOOD IVINS, Philadelphia, Pa. Filed July 2, 1895. Renewed Mar. 14, 1898. Serial No. 673,867. (No model.)



Claim.—As an article of manufacture, a fork side for bicycles consisting of a seamless tube having each end thereof made comparatively thick and gradually diminishing in thickness from both ends toward its center, such gradually-diminishing thickness of metal merging into each other at a distance from the ends of the tube and at a point where the least strength is required; the exterior of the tube being cylindrically tapering from end to end and its interior cylindrically tapering or conical from an intermediate point in opposite directions toward each end, so that the strength of the tube may gradually increase from its weakest point toward either end, where increased strength is required, substantially as described.

609,013. FORK SIDE FOR BICYCLES. ELLWOOD IVINS, Philadelphia, Pa. Filed Sept. 13, 1898. Renewed Mar. 14, 1898. Serial No. 673,868. (No model.)



Claim.—1. As a new article of manufacture, a tubular frame-piece for bicycles and other vehicles, consisting of a drawn tube having a series of tapering ribs on its inner surface extending longitudinally thereof, said ribs being thickest at or near the end or ends of the tube and gradually decreasing in size toward its center, substantially as described.

2. A fork side for bicycles, consisting of a seamless tube having a series of longitudinal ribs tapering inwardly from each end thereof toward its center and gradually vanishing or merging into an intermediate portion of smooth bore, substantially as described.

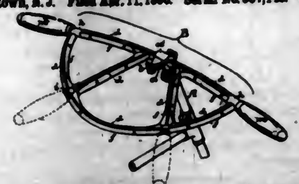
3. A fork side for bicycles, consisting of a seamless tubular piece of tapering form having a series of longitudinal ribs extending from each end on the inside thereof toward its center and gradually diminishing in size until they vanish or merge in an intermediate portion having a smooth bore, substantially as described.

602,014. RAILWAY-SWITCH. EDWIN J. JENKINS, Elloree, S. C., assignor of part to J. M. Oliver and Henry H. Brunson, Orangeburg, S. C. Filed July 27, 1897. Serial No. 646,069. (No model.)

Claim.—1. In an automatic switch the combination of the rails, the switch-rails, a spring between said main and switch rails, rockers loosely attached to said switch-rails, a connecting-bar for said rockers, inclined bars resting on said connecting-bar, and hangers carried by the coaches adapted to impart the operating-pressure to the said inclined bars, substantially as described.

2. An automatic switch comprising the main and switch rails, rockers attached to said switch-rails, a connecting-rod for said rockers, inclined rods or bars having their highest points resting on and loosely secured to said connecting-bar, which are adapted to receive the operating-pressure from the train, hangers carried by the train and operated therefrom, substantially as described.

3. An automatic switch comprising the main and switch rails, a spring between said main and switch rails, rockers loosely attached to said switch-rails, a rod connecting said rockers, the inclined rods resting on said connecting-rod and operated from the train and a spring-actuated catch to hold the switch closed and operated by the rockers, substantially as described.



4. An automatic switch composed of the main rails, the switch-rails, a raised inclined portion on one of said switch-rails, rockers loosely attached to said switch-rails, a connecting-bar for said rockers, inclined bars arranged longitudinally between the main rails their highest point resting on said connecting-bar and adapted to receive operating-pressure from the train and a spring-actuated catch operated by the said rockers and adapted to securely hold the switch-rails closed, substantially as described.

602,015. ADJUSTABLE HANDLE-BAR FOR BICYCLES. FRANK JOHNSON, Rhinelander, Wis. Filed Aug. 11, 1896. Serial No. 602,426. (No model.)

Claim.—The combination with a steering-head, of a handle bar journaled therein and provided with a rack, a locking-plate hinged to the steering-head and provided with teeth and a vertical elongated curved slot, a spring for keeping the teeth of the locking-plate normally in engagement with the rack of the handle-bar, a lever pivoted to the handle bar and provided with a finger which works in the slot of the locking-plate and has a head on its end to prevent detachment from the locking-plate, and a presser-spring for said lever.

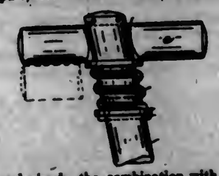
602,016. HANDLE-BAR FOR BICYCLES. HENRY H. JOHNSON, Morristown, N. J. Filed Apr. 11, 1896. Serial No. 587,148. (No model.)

Claim.—1. A bicycle handle-bar consisting of a transverse pivot-bar and a bar connected thereto and constituting a segment of a circle, the pivot bar being hung to the upper end of the handle-bar post so that the segmental bar is susceptible of swinging vertically and being combined with means whereby it can be secured to said post after adjustment, substantially as specified.

2. A bicycle handle-bar consisting of a transverse pivot-bar and a bar connected thereto and constituting a segment of a circle, the pivot-bar being hung to the upper end of the handle-bar post so that the segmental bar is susceptible of swinging vertically, and said segmental bar being provided with handles adjustable to different positions around the same, substantially as specified.

3. A bicycle handle-bar consisting of a transverse bar secured to the upper end of the handle-bar post, and a bar secured to said transverse bar and constituting a segment of a circle, said handle-bar having openings therein at right angles or thereabout to each other, and said openings being provided with means for the reception and rigid retention of detachable handles, substantially as specified.

602,017. INCUBATOR. ROMAN T. KANSKI, New York, and EDWARD S. FREEMAN, New Rochelle, N. Y. Filed Apr. 23, 1897. Serial No. 633,630. (No model.)



Claim.—1. In an incubator, the combination of an exterior casing having suitable openings and doors, a heater, an interior casing constituting the egg-chamber and having an outlet or passage through said exterior casing, a heat-transmitting partition forming the floor of said egg-chamber but less in area than the bottom of said egg-chamber, a frame 15 constructed and arranged to support said floor, a sand seal following the edges of said floor within the egg-chamber, a closed receptacle suspended within said egg-chamber, pivoted doors in said exterior casing, levers attached to said doors, a vertical rod pivotally jointed with the levers, a tube secured vertically to said rod, piping connecting said closed receptacle and vertical tube and having a flexible portion, said receptacle, piping and tube containing an expansive liquid, and variable weights borne by said levers, substantially as described.

2. In an incubator, an exterior casing, an interior casing supported by said exterior casing and constituting the egg-chamber, a partition arranged as the floor of said egg-chamber, said partition consisting of a stone plate less in area than the bottom of said egg-chamber, a frame 15 supporting said plate, a detachable flange or ridge upon the upper surface of said plate near its edges, and a sand seal contained between said flange and the walls of said egg-chamber and covering the edges of said plate, the sand acting also as a receiver and distributer of moisture, substantially as described.

3. In an incubator, the combination of a casing having suitable openings and doors, a stone slab arranged to divide said casing interiorly into an upper egg chamber and a lower heater-chamber, said egg-chamber having independent side walls forming an air-space within said casing, a heater adjustable toward or from said stone, said stone being so formed and supported as to leave, within the egg-chamber, a recess or gutter between its edges and the casing, absorbent material filling said gutter thereby forming a seal to exclude fumes from the heater, a pipe for serving water to said absorbent material and for ventilating said egg-chamber, removable egg-trays and supports therefor, a walled passage leading into said egg-chamber from a casing-opening, pivoted shutters forming part of said casing, levers attached to said shutters, a receptacle and tubing containing expansible fluids, said tubing having a flexible portion, a rod attached to said tubing and pivotally jointed to said levers, adjustable weights arranged to act upon said levers and to balance the weight of said rod with the tubing and contents borne thereon, substantially as described.

4. In an incubator, the combination of a casing having suitable openings and doors, a soapstone slab arranged to divide said casing interiorly into an upper egg-chamber and a lower heater-chamber, said egg-chamber having independent side walls forming an air-space within said casing, a heater adjustable toward or from said soapstone, said stone being so formed and supported as to leave, within the egg-chamber, a recess or gutter between its edges and the casing, sand filling said gutter thereby forming a seal to exclude fumes from the heater, a pipe for serving water to said sand and for ventilating said egg-chamber, removable egg-trays and supports therefor, a walled passage leading into said egg-chamber from a casing-opening, pivoted shutters forming part of said casing, levers attached to said shutters, a receptacle and tubing containing fluids of different expansibility, said receptacle being located within the egg-chamber, said tubing having a flexible portion, a rod attached to said tubing and pivotally jointed to said levers, adjustable weights arranged to act upon said levers and to balance the weight of said rod with the tubing and contents borne thereon, substantially as described.

602,018. SADDLE-SUPPORT FOR VELOCIPEDES. ALFRED J. PARKER, Newark, N. J., assignor to Harry Louis Hepburn, New York, N. Y. Filed Sept. 9, 1896. Serial No. 605,267. (No model.)

Claim.—In a velocipede, the combination with the slotted bar of the frame, of a horizontal saddle, supporting-bar, recessed at *i*, *i*, the end walls of the recesses being rounded and a spring for holding the horizontal bar in an elevated position, substantially as set forth.

602,019. TOY. JOSEF SCHUPAN, Fürstheim, Germany. Filed July 27, 1897. Serial No. 646,127. (No model.)

Claim.—1. As a means for making top-like disks spin, the combination with a plate *b*, a ledge b^3 upon said plate, and an elastic cover b^2 upon said ledge, of a lever *c* attached to the plate *b*, a ledge c^4 upon said lever, an elastic cover c^3 upon this ledge, and means for holding the said plate and operating the lever, as set forth.

2. As a means for making top-like disks spin, the combination with a plate *b*, a ledge b^3 upon said plate, and an elastic cover b^2 upon said ledge, of a lever *c c'* attached to the plate, a ledge c^4 upon said lever, an elastic cover c^3 upon this ledge, a handle *f* secured to the plate *b*, and a lever *g g'* attached to said handle, and adapted to operate the lever *c c'*, as set forth.

3. As a means for making top-like disks spin, the combination with a plate *b*, a ledge b^3 upon said plate, and an elastic cover b^2 upon said ledge, of a lever *c c'* attached to the plate, a ledge c^4 upon said lever, an elastic cover c^3 upon this ledge, a figure representing a hunter having movable arms and a gun held by said arms, and adapted to be fixed to the plate *b*; a lever reaching down from said arms into the way of the lever *c c'*, and means for holding the said plate and operating the lever *c c'*, as set forth.

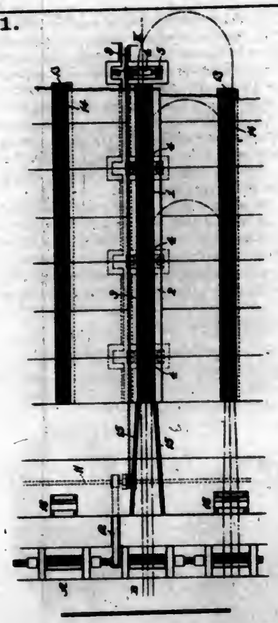
602,020. WHEEL-RIM. LEANDER D. JUDKINS, Boston, Mass., assignor of one-half to Alexander F. Munro, same place. Filed Oct. 21, 1897. Serial No. 655,909. (No model.)

Claim.—1. The combination with a wheel-rim, of a tire extending around the outer face thereof, the surface of said tire lying in contact with the said face and extending across the same, and fastening devices comprising plates or strips of suitable material provided with lateral extensions curved to conform to and support the surface of the tire where it projects beyond the sides of the rim so as to afford in conjunction with the said rim a channel to laterally support the tire, and means for securing said fastening devices to the opposite sides of the rim, substantially as and for the purpose described.

2. The combination with a wheel-rim, of a pneumatic tire comprising a continuous tube extending around and supported upon the outer face of said rim, flaps or extensions from the outer surface of the said tire separated from each other by a space substantially equal to the width of the said face across which the said tire extends between said flaps, fastening devices comprising plates or strips of suitable material adapted to engage the outer surfaces of the tire-flaps and to be secured to the wheel-rim at opposite sides thereof, and lateral extensions from said fastening devices curved to conform to and support the tire where it projects laterally beyond the said wheel-rim, substantially as described

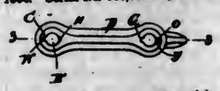
---

602,021. ROD-MILL FLOOR. GEORGE LEHBERGER, Braddock, Pa., assignor of one-half to Peter McIlvried, same place. Filed June 26, 1897. Serial No. 642,266. (No model.)



Claim.—1. In a rod-mill the combination of a pair of rolls, a floor extending in front of the rolls and a feed mechanism consisting of a series of positively-driven rollers arranged in the line of feed of the rods as they come from the rolls and with their upper surfaces approximately on a level with the floor, substantially as set forth.

2. In a rod-mill the combination of a pair of rolls, a floor extending in front of the rolls, a trough below the level of the floor and arranged in the line of movement of rods coming from said rolls and a series of positively-driven rollers arranged along said trough, substantially as set forth.



3. In a rod-mill the combination of a pair of rolls, a trough arranged below the floor and in the line of movement of rods coming from said rolls, a vertical shield or guide along one side of the trough, and a series of positively-driven feed-rollers arranged along said trough, substantially as set forth.

4. In a rod-mill, the combination of two pairs of rolls, troughs arranged below the floor-level and in the line of movement of rods coming from one pair of rolls and going to the other pair of rolls, vertical guards or shields arranged along the outer sides of said troughs, and a series of positively-driven feed rollers, arranged in the trough in line with the delivery-rolls, substantially as set forth.

602,021.

602,022. CLEVIS. WILLIAM H. LIGHTCAP, Hazel Green, Wis. Filed Dec. 19, 1896. Serial No. 616,330. (No model.)

Claim.—1. In a clevis, the combination with a bar A, of a pin B, a link L, and a bar D, the bar D being provided with holes adjacent to the ends provided with the slots H and G, and the pin and link being provided with suitable lugs adapted to register with the slots, substantially as shown and described.

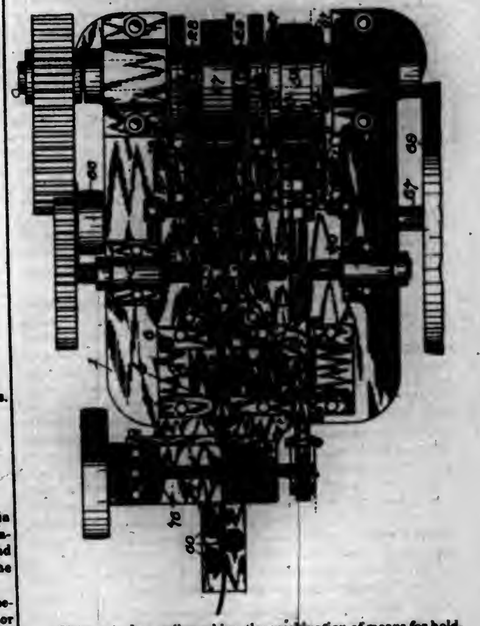
2. In a clevis, the combination with a bar A having rigidly secured thereto a pin B having a lug C, a link L having the pivot or journal end portions N and N' provided with like lugs, and a bar D having suitable journal-perforations adapted to receive the journal portions of the pin B and link L and provided with suitable slots H and G to allow of the connection of the parts when in one position, and the bar A being provided with a suitable journal perforation and slot adapted to receive the pivot portion N' of the link L, substantially as shown and described and for the purposes set forth.

3. In a clevis, the combination with a bar A, of a pin B, a bar D, and a curved link L provided with journal portions N and N' pivoted in the bars A and D, the construction being such that the bar D can only be disconnected from the pin B when the bow of the link is pointing toward the pin B, substantially as shown and described and for the purposes set forth.

4. In a clevis, the combination with a bar A, of a bolt B having a lip C at the upper end, a bar D having a slot H, and a link L pivoted to the bars A and D in such manner as by its rotation to give a reciprocal movement to the bar D so as to lock and unlock the same from the pin B, substantially as shown and described and for the purposes set forth.

5. In a clevis, the combination with a bar A, of a bolt B connected at one end with the bar A and having a lip C at the other end, a bar D having a slot H adapted to fit over the lip C and be drawn back under the same, and a curved link L rotatably pivoted in the bars A and D the pivots being eccentric one to another, substantially as shown and described and for the purposes set forth.

602,023. DUSTLESS ROAD, RAILWAY ROAD-BED, &c. FREDERICK W. MATTERN, Los Angeles, Cal., assignor, by mesne assignments, to the Dustless Roadbed Company, Camden, N. J. Filed Dec 5, 1896. Serial No. 615,008. (No model.)



Claim.—1. A road having a covering consisting of fine earthy or mineral matter and heavy oil incorporated therewith, substantially as set forth.

2. A road having a covering consisting of fine earthy or mineral matter and heavy oil and maltha incorporated therewith, substantially as described.

3. A railway road-bed of fine material, such as gravel, sand, or cinder, having its surface treated with heavy oil as and for the purpose set forth.

602,024. NAIL-MACHINE. JOHN A. STAPLES and CHARLES BUSH, Newburg, N. Y., assignors to Charles H. Hanford, same place. Filed July 14, 1897. Serial No. 644,585. (No model.)

Claim.—1. In a nail-machine, the combination of means for holding a nail-blank, with a nail-heading punch or die, means for gradually pushing or forcing the punch or die against the end of the blank, to spread the metal into a head, as distinguished from a sudden blow, and means for imparting a movement to the punch or die in a direction transverse to the line of thrust during the gradual spreading thrust of the die against the blank, said transverse movement assisting the spreading of the metal, substantially as and for the purpose set forth.

2. In a nail-machine, the combination of means for holding a nail-blank, with a nail-heading punch or die, means for gradually pushing or forcing the punch or die against the end of the blank, to spread the metal into a head, as distinguished from a sudden blow, and means for imparting an oscillatory motion to the punch during the gradual head-spreading thrust of the die against the blank to assist in the formation of the head, substantially as set forth.

3. In a nail-machine, the combination of a suitable clamp for holding a blank, a longitudinally and circumferentially movable header carrying a heading die, means for gradually moving the header longitudinally for forcing the die against the blank, to spread the metal into a head, and means for simultaneously imparting a circumferential movement to the header, to assist the spreading action, substantially as set forth.

4. In a nail-machine, the combination of a suitable clamp for holding a blank, a longitudinally-movable and circumferentially-oscillating header adapted to receive a metal-spreading heading punch or die, means for imparting a gradual longitudinal spreading movement to the header longitudinally, as distinguished from a sudden blow, means for simultaneously oscillating the header, to assist the spreading action, and means for operating the clamp, substantially as set forth.

5. In a nail-machine, the combination of a blank-holding clamp, means for operating the clamp, a header comprising a longitudinally-sliding portion and a circumferentially-movable portion, a heading die or punch secured to the header, and means for imparting a longitudinal movement to the header and simultaneously therewith oscillate the circumferentially-movable portion, substantially as set forth.

6. In a nail-machine, the combination of a suitable wire-feeding device, the laterally-operating holding and cutting-off clamp, combined longitudinally movable and oscillatory header, carrying a heading device or punch, a longitudinally-moving wedge engaging the movable member of the lateral clamp, a power-shaft, and cams mounted upon said power-shaft for operating said header and wedge, substantially as set forth.

7. In a nail-machine, the combination of a blank-holding clamp, means for operating the clamp, a heading punch or die, and an intermittently-operating wire-feeding device automatically thrown out of operation by the action of the clamp-operating means, substantially as set forth.

8. In a nail-machine, the combination of a blank-holding clamp, means for operating the clamp, a header, a pair of blank-feeding rolls, and means operated by the clamp-operating means for rendering the feed-rolls inoperative, substantially as set forth.

9. In a nail-machine, the combination of a blank-holding clamp, a header, feed-rolls, a block or wedge mounted between the shafts or journals of the feed-rolls, and means for automatically operating the block or wedge for moving the rolls into or out of operative relation, as set forth.

10. In a nail-machine, the combination of a blank-holding clamp, a header, cooperating feed-rolls, a block or wedge mounted upon the journal or shaft of one of the feed-rolls and adapted to engage the shaft or journal of the other feed-roll, means for forcing said block or wedge in one direction for separating the feed-rolls and said block or clamp being adapted to be moved in the opposite direction by the rotation of the shafts or journals, as set forth.

11. In a nail-machine, the combination of a blank-holding clamp, a header, cooperating feed-rolls, a block or wedge formed with a socket fitting on the shaft or journal of one feed-roll and an elevated portion adapted to engage the shaft or journal of the other feed-roll, and means for operating said block or wedge, as set forth.

12. In a nail-machine, the combination of a blank-holding clamp having a stationary and movable member, a wedge for operating the movable member, a pair of feed-rolls, a block or wedge supported between the shafts or journals of the feed-rolls, and an arm projecting from the clamp-operating wedge and suitably connected with the block or wedge for operating it, as set forth.

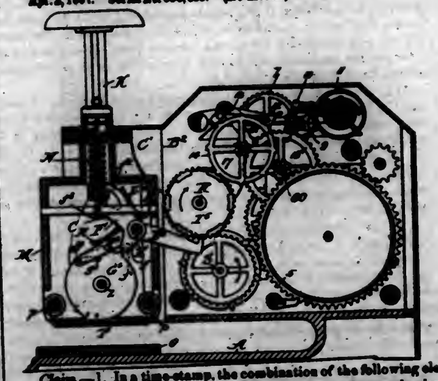
13. In a nail-machine, the combination of the blank feeding mechanism, the cutting-off and holding die or clamp, and the header and operating mechanism, the operating mechanism of the header being constructed and arranged to cause the header to recede slightly as the blank is cut off just prior to the heading operation, as and for the purpose set forth.

14. In a nail-machine, the combination of the stationary and movable blank-holding members, the header, the operating-wedge engaging the movable member of the blank-holding clamp for forcing it in one direction, and a secondary wedge on the main operating-wedge engaging a projection or shoulder on the said movable member for moving it in the opposite direction, as set forth.

15. In a nail-machine, the combination of means for feeding a wire blank, a blank-holding clamp or die, a heading die or punch, means for operating the blank-holding clamp and heading die or punch, and a guide such as 95 arranged in the path of the wire blank and adapted to center the blank in the holding clamp or die, as set forth.

16. In a nail-machine, the combination of means for feeding a wire blank, a holding clamp or die, a header, means for operating the clamp and header, and a blank-guide such as 95 adapted to guide the blank to the clamp and means for moving the guide out of the way of the header when the header comes into operation.

17. In a nail-machine, the combination of means for feeding a wire blank, a holding clamp or die, a header, means for operating the clamp and header, and a blank-guide such as 95 formed with a beveled shoulder for guiding the blank into position in the clamp, and means of engagement between the header and guide for throwing the latter out of position when the former is brought into operation, as set forth.



18. In a nail-machine, the combination of means for feeding a wire blank, a holding clamp or die, a header, means for operating the clamp and header, and a blank-guide supported in the path of the blank and movable laterally thereto; said guide having a beveled shoulder against which the end of the blank impinges to center it in the holding-clamp, and a second beveled shoulder against which the header impinges to move it out of the way when the header operates, as set forth.

602,025. EYEGLASS-CASE. CHARLES B. WHITE, Quincy, Mass., assignor to William B. White, Boston, Mass. Filed Nov. 23, 1896. Serial No. 613,797. (No model.)

Claim.—The herein-described eyeglass-case consisting of a blank bent or folded at its sides to form the ends of the case and folded upwardly at its lower end to form the front of the case and provided near its edge with a hollow headed stud, a cover hinged to the back of the case and adapted to be folded onto the front and provided with a spring-socket to engage the headed stud, and a post one end of which is adapted to enter the hollow stud and span the space between the front and back of the case to hold them separated a suitable distance so that the case may not collapse and injure the eyeglass, substantially as described.

602,026. TIME-STAMP. JOHN S. BLEMING, Chicago, Ill., assignor, by direct and mesne assignments, to Albert Tuerk, same place. Filed Apr. 2, 1897. Serial No. 630,415. (No model.)

Claim.—1. In a time-stamp, the combination of the following elements: the clock mechanism, a series of cams connecting mechanism whereby the movement of the clock operates the cams, registering devices normally wholly disconnected from the clock mechanism and the cams, and means for momentarily securing mediate connection between the registering devices and the cams, whereby the position of the cams regulates the impression of the stamp, substantially as described.

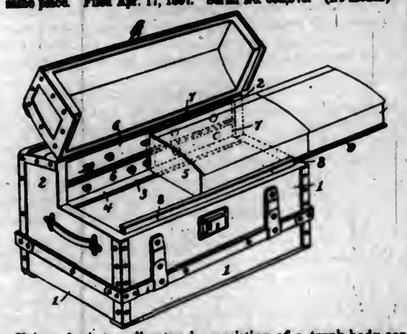
2. In a time-stamp, the following elements in combination: clock mechanism, a controlling-train, whereby the clock remains inactive at regular intervals, a series of cams, mechanism connecting the same to the clock whereby the movement of the clock operates the cams, registering devices normally wholly disconnected from the clock mechanism and the cams, and means for momentarily securing mediate connection between the registering devices and the cams, whereby the position of the cams regulates the impression of the stamp, substantially as described.

3. In a device of the kind described, the clock mechanism, a series of cams, and connecting mechanism whereby the movement of the clock operates the cams, in combination with a movable frame containing a series of registering-wheels, wholly disconnected from the clock mechanism and cams, and means for momentarily securing mediate connection between the registering-wheels and the cams, whereby the position of the cams regulates the position of the registering-wheels, when the stamp is operated, substantially as set forth.

4. In a device of the kind described, a clock mechanism, a controlling-train whereby the clock remains inactive at regular intervals, cams, and connecting mechanism whereby the movement of the clock operates the cams, in combination with a movable frame containing a series of registering-wheels wholly disconnected from the clock mechanism and the cams, and means for momentarily securing mediate connection between the registering-wheels and the cams, whereby the position of the cams regulates the position of the registering-wheels when the stamp is operated, substantially as described.

5. In a device of the kind described, the clock mechanism, a series of cams, and connecting mechanism whereby the movement of the clock operates the cams, in combination with a vertically-movable frame and series of registering-wheels, G, G', &c., provided with cam-formed slots, *g*, *g'*, &c., levers, D, D', &c., pivoted between their ends and provided at their outer ends with pins, *d*, *d'* &c., adapted to be loosely positioned in said slots, the inner ends of the levers extending into the clock mechanism and being positioned in a vertical plane with the several cams, and means for normally holding the outer ends of the levers at their upper limit, whereby upon depressing

the frame the levers are released and the registering-wheels set in a position governed by the upward movement of the inner ends of the levers as limited by the action of the cams, substantially as described.



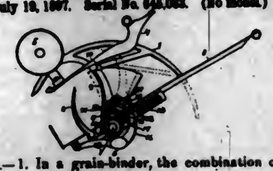
6. In a device of the kind described, the clock mechanism and controlling-train whereby the clock remains inactive at regular intervals, a series of cams, and connecting mechanism whereby the movement of the clock operates the cams, in combination with a vertically-movable frame, a series of registering-wheels, G, G', &c., provided with cam-formed slots, *g*, *g'*, &c., levers, D, D', &c., pivoted between their ends and provided at their outer ends with pins, *d*, *d'*, adapted to be loosely positioned in said slots, the inner ends of the levers extending into the clock mechanism, and being positioned in a vertical plane with the several cams, and means for normally holding the outer ends of the levers at their upper limit, whereby upon depressing the frame the levers are released and the registering-wheels set in a position governed by the upward movement of the inner ends of the levers as limited by the action of the cams, substantially as and for the purpose set forth.

7. In a device of the kind described, the movable frame, M, the plunger, K, the frame, F, the registering-wheels, G, G', &c., and the levers, D, D' &c., in combination with a clock mechanism, the cams, I, I' &c., and connecting mechanism between the clock and said cams whereby the movement of the clock operates the cams, substantially as and for the purpose set forth.

8. In a device of the kind described, the movable frame, M, plunger, K, frame, F, registering-wheels, G, G' &c., provided with alinement depressions 1, 2, 3, the levers, D, D' &c., and the spring H, in combination with a clock mechanism, the train 6, 7, 8, 9, 10, 11, 12, 13, 14, and 15, the cams, I, I', &c., and connecting mechanism whereby the clock mechanism remains inactive at regular intervals and when in action regulates the position of the cams, substantially as and for the purpose set forth.

9. In a device of the kind described, the frame M, the plunger K, the frame F, spring L, registering-wheels, G, G' &c., provided with alinement depressions 1, 2, 3, the levers, D, D' &c., the spring H and the inking-ribbon P and pad O, in combination with a clock mechanism, the cams, I, I', and connecting mechanism whereby the operation of the clock regulates the position of the cams, substantially as and for the purpose described.

602,027. TRAVELING-TRUNK. HENRY A. BOOTH and JOHN P. PLUMMER, Petersburg, Va., assignors of one-fourth to Bernard Mann, same place. Filed Apr. 17, 1897. Serial No. 632,573. (No model.)



Claim.—1. A traveling-trunk, consisting of a trunk-body constructed along its rear portion with an elevated top casing containing drawers, a bottom wall fitted into the trunk-body under said casing, bracing the top portion of the trunk-body and projecting in front of the drawers to provide an offset ledge, a guideway arranged at the top front edge of the trunk body and open at both ends, a lengthwise-sliding tray resting at its inner edge upon said offset ledge, engaged at its front edge with said guideway and constructed to stand in front of and cover and conceal the drawers in the elevated casing, and to be slid in either direction from the ends of the trunk, and a cover-section hinged to the top front edge of the drawer-casing, substantially as described.

2. The combination, in a traveling-trunk, of a trunk-body constructed along its rear portion with an elevated top casing containing sliding drawers, a bottom wall arranged in the trunk-body under said casing, bracing the end and rear walls of the trunk-body and having an offset ledge in front of the drawers, a grooved guide arranged at the front top edge of the trunk-body, a lengthwise-slidable tray supported by said ledge and said grooved guide, constructed to slide longitudinally in either direction from the ends of the trunk and made substantially the height of the drawer-casing, so that the drawers are covered and concealed by the tray when it is in normal position, and a cover-section hinged to the front top edge of the drawer-casing, substantially as described.

3. A traveling-trunk, consisting of a trunk-body constructed along its rear portion with an elevated top casing containing drawers, an offset ledge running along the front bottom portion of said casing, a grooved guideway arranged at the top front edge of the trunk-body and open at both ends, a horizontally-projecting guide-rib extending along the central portion of the elevated top casing, a lengthwise-sliding tray supported by said offset ledge and grooved guideway and resting against the said horizontal guide-rib, and the cover-section hinged to the top front edge of the trunk-body, said tray normally standing in front of and concealing the drawers in the elevated casing and constructed to be slid in either direction from the ends of the trunk, substantially as described.

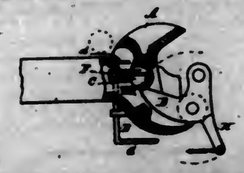
4. A traveling-trunk, consisting of a trunk-body constructed along its rear portion with an elevated top casing containing drawers, an offset ledge running along the front bottom portion of said casing and projecting in front thereof, a grooved guide at the top front edge of the trunk-body and open at both ends, a horizontally-projecting guide-rib extending along the elevated top casing above and parallel with said offset ledge, a lengthwise-sliding tray resting at its inner edge upon the offset ledge and having at its outer edge a flange engaging the grooved guideway, and a cover-section hinged to the top front edge of the trunk-body, said tray normally standing in front of the drawers and constructed to be slid in either direction and in its sliding motions guided by the said projecting guide-rib, substantially as described.

602,028. GRAIN-BINDER. EDWARD W. DEERING, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed July 19, 1897. Serial No. 645,063. (No model.)

Claim.—1. In a grain-binder, the combination of feeding and packing mechanism, a trip and compressor arm, a cord holder and knotter, a needle or cord-placing arm and a two-part supplemental compressor having its lower member pivoted upon the axis of the needle and adapted to be moved forward with it against the gavel, a swinging leg pivoted to said lower member and adapted to engage with a fixed part of the binder-frame to retain said lower member against the gavel during a portion of the retrograde movement of the needle, a means for disengaging the leg from the said fixed part, an upper part pivoted to the lower part and adapted to be carried forward with it, said upper part being provided with a heel extension adapted to engage with a portion of the needle for the purpose of retaining it against the gavel during a portion of the retrograde movement of the needle, substantially as and for the purpose described.

2. In a grain-binder, the combination of a needle and a compressor acting upon opposite sides of the gavel, with an auxiliary or supplemental compressor attached to, and having a limited pivotal movement upon the axis of said needle and adapted to be moved forward with the needle against the gavel, and a leg pivoted to said auxiliary compressor adapted to engage with a fixed part of the binder to retain said compressor against the gavel, and a means for disengaging said leg from said fixed part, substantially as and for the purpose described.

3. In a grain-binder, the combination of the needle with a supplemental compressor pivoted at or near its axis, and adapted to move forward with it, and a means for positively retaining said compressor against the gavel during a portion of the retrograde movement of said needle.



4. In a grain-binder, the combination of the needle with a supplemental compressor pivoted at or near its axis, and adapted to move forward with it, and a means for positively advancing said compressor against the gavel during a portion of the retrograde movement of said needle.

5. In a grain-binder, a needle and an auxiliary compressor comprising two primary members, one of which members has a limited pivotal movement upon the axis of the needle, a stud upon the needle adapted to engage with the two members and carry them forward with the needle, a means for retaining in its forward position the member which is pivoted to the axis of the needle, during a portion of the backward movement of the needle, and a heel extension upon the other member adapted to engage with the stud upon the needle and maintain said member in its forward position during a portion of the retrograde movement of the needle, substantially as and for the purpose described.

6. In a grain-binder, an auxiliary compressor comprising the following members in combination, the part 8 having the eccentric slot 11, the parts 9 and 12 pivotally connected with part 8, the helical spring 15 interposed between the parts 8 and 12, the heel extension 18 upon part 9, the toe-piece 20 upon part 12, the step 16 upon the frame-piece 6, the needle 1 and the stud and rivet passing through the eccentric slot 11, the roller 17, and the lip 19, substantially as and for the purpose described.

7. In a grain-binder, a needle and an auxiliary compressor comprising two primary members, one of which members has a limited pivotal movement upon the axis of the needle, a stud upon the needle adapted to engage with the two members and carry them forward with the needle, a means for retaining in its forward position the member which is pivoted to the axis of the needle during a portion of the backward movement of the needle, and a heel extension upon the other member adapted to engage with the stud upon the needle and to advance said member against the gavel during a portion of the retrograde movement of the needle, substantially as and for the purpose described.

602,029. CAR-COUPLING. JOHN W. FAWCETT, Lawrenceburg, Ind., assignor of two-thirds to John H. Fox and John Bamart, same place. Filed Oct. 14, 1897. Serial No. 655,116. (No model.)

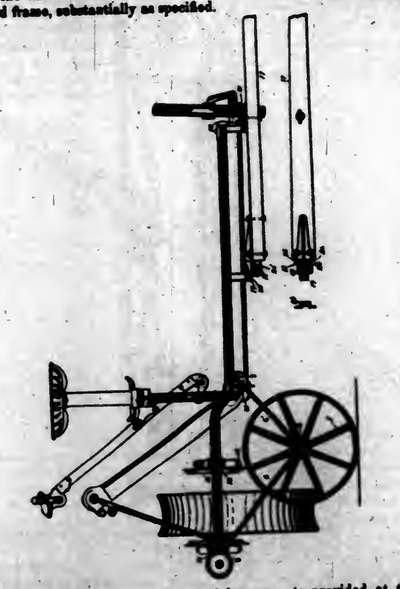
Claim.—1. In a car-coupler, the combination with the draw-head, formed with an inclined cavity with a lateral opening at one end, the ball located in said cavity, the vertical pin passing through an opening in the draw-head, the rock-shaft journaled below said cavity and provided with an upwardly and forwardly extending arm, of the knuckle formed with a rearwardly-extending arm adapted to engage with said ball, substantially as described.

2. In a car-coupler, the combination with the draw-head formed with an inclined cavity, a lateral curved opening intersecting the same, the ball located in said cavity, the vertical pin for holding said ball in place, the rock-shaft, the forwardly and upwardly extending arm, and the stirrup-shaped projection at the front of the draw-head, of the pivoted knuckle having a rearwardly-extending arm adapted to engage with said ball, substantially as described.

602,030. HARVESTER-TRUCK. JAMES A. GRAHAM and EDWARD J. BURKETT, Milwaukee, Wis., assignors to the Milwaukee Harvester Company, same place. Filed June 4, 1897. Serial No. 639,402. (No model.)

Claim.—1. In a harvester-truck, the combination of the axle and wheels, with sustaining link-braces having pivotal connection with the axle and adapted to be hooked to portions of the harvester-frame in a manner to sustain its entire weight.

2. In a harvester-truck, the axle and wheels, the clips clamped to the axle and provided with bearings for the hook-shaped ends of the sustaining-links.



3. In a harvester-truck, the combination of the axle and the clamping-clips provided with bearings for the reception of the hook-shaped ends of the sustaining-links, and the pintle portion projecting into the axle, with the clamping-bolts, substantially as specified.

4. In a harvester-truck, the axle provided with means for attaching pivotal sustaining-links thereto.

5. In a harvester-truck, the axle provided with means for attaching pivotal sustaining-links thereto, said links adapted to swing down approximately parallel with said axle, substantially as shown and described.

6. In a harvester-truck attachment, a draft-pole provided at its rear end with a supplemental draft connection, said draft-connection provided with a hook-shaped portion, and an upwardly-projecting portion, in combination with a bracket affixed to the under side of the harvester-platform and into which the hook-shaped portion of the draft connection is adapted to seat itself, and a means for securing the draft-pole to the grain-wheel end of the harvester-platform, substantially as described.

7. In a harvester-truck, sustaining-supports having connection with the axle near the supporting-wheels, and diverging as they extend upward and provided with means for attaching their upper ends to the harvester-frame and adapted to sustain the entire weight of said frame, substantially as specified.

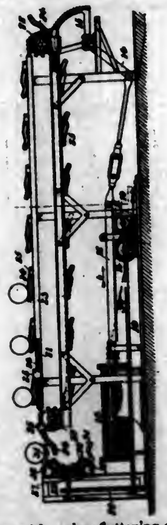
8. In a harvester-truck, sustaining-supports provided at their lower ends with hook-shaped portions, clips clamped to the axle and adapted to receive the hook-shaped ends of the sustaining-supports and provided with a shouldered recess for the reception of the wheel-hub, substantially as shown and specified.

9. In a harvester-truck, sustaining-supports having pivotal connection with the axle and diverging as they extend upward and provided with hook-shaped ends adapted to connect with a part secured to the frame of the part to be supported in a manner to sustain the entire weight of said part, and means for securing them in said parts, substantially as described.

10. In a harvester-truck, the combination of the axle and wheels, the sustaining-links adapted to connect with fixed parts of the harvester-frame, and connecting-clips between the members of the truss-frame and the sills, said clips provided with loop portions for the reception of a sliding latch to lock said sustaining-links in operative position, substantially as shown and described.

11. In a harvester-truck, the combination of the axle and wheels, the sustaining-links, having hook-shaped ends to connect with fixed parts of the harvester-frame, and other hook-shaped ends having pivotal connection with a part clamped to the truck-axle, with pivotal, gravity-latches to retain the upper hook-shaped ends of said sustaining-links in operative position, substantially as shown and described.

12. In a harvester-pole attachment, the combination of a pole, a draft-casting connected thereto, a draft-stud connected with the harvester-frame, said draft-stud provided with an annular groove or collar, and a yielding latch pivoted to the draft-casting and engaging with the annular groove or collar, substantially as described.



13. In a harvester-pole attachment, the combination of a pole, a draft-piece connected thereto, said draft-piece provided with the raised portion 20', a bracket secured to the harvester-platform, and said draft-piece provided with a hook portion adapted to connect with the bracket, substantially as shown and described.

14. In a harvester-pole attachment, the combination of a pole, a draft-casting connected thereto, a latch pivoted to the draft-casting, a spring acting upon the latch, a draft-stud secured to the harvester-frame, said draft-stud provided with a notch or shoulder portion adapted to engage with the spring-pressed latch whereby the said draft-stud and the said draft-casting are maintained in pivotal relation, substantially as described.

602,031. GLASS-ANNEALING LEHR. JOHN H. LINGENS, New Kensington, Pa. Filed Mar. 10, 1897. Serial No. 626,727. (No model.)

Claim.—1. The combination with a glass-flattening oven, of a carrier extending thereinto and consisting of an endless chain having guide-blocks, and guide-bars between which they travel, said chain

having lateral supporting-arms for the glass cylinders; substantially as described.

2. The combination with a glass-flattening oven, of a carrier extending thereinto, and an endless conveyer having arms which cross the path of motion of the carrier, whereby glass cylinders carried by the conveyer are deposited upon the carrier; substantially as described.

3. A carrier for carrying and transferring glass cylinders, the same comprising an endless chain having arms fixed at one end to the chain and extending thence free from the chain in a direction substantially parallel with the line thereof; and a second carrier extending in a line which is crossed by said arms as they project from the chain at the turning-point; substantially as described.

4. A carrier for carrying and transferring glass, the same comprising an endless chain having arms fixed at one end to the chain and extending thence free from the chain, substantially parallel with the line thereof, said arms being adapted to support and carry the glass and to project at the turning-point of the chain, and a receiving device situated at the turning-point of the chain, and adapted to be crossed by said arms as they project, substantially as described.

5. The combination with a glass-flattening oven, having a flattening-table, of a movable plate or bottom arranged in proximity to the flattening-table, and adapted to cause the discharge of broken glass, substantially as described.

6. The combination with a glass-flattening oven, having a flattening-table, of a movable plate or bottom arranged in proximity to the flattening-table and adapted to cause the discharge of broken glass, and a carrier extending into the oven over said plate or bottom, substantially as described.

602,032. PAPER-BAG CABINET. PETER F. MAUER, Stapleton, Minn. Filed Apr. 30, 1897. Serial No. 634,633. (No model.)

Claim.—In a paper-bag cabinet, a casing divided into compartments corresponding to the sizes of bags, and with a hinged front to each of said compartments, a sliding shelf in the bottom of each of said compartments upon which the supply of bags is retained, and supported upon ways by which a cavity is formed beneath each shelf, a spring in each of said cavities connected by its ends to the casing and the shelf, and rods connecting each of said shelves to its respective front, substantially as hereinbefore set forth.

602,033. AGRICULTURAL IMPLEMENT. HERSCHEL C. MILBURN, Whiteville, La. Filed Mar. 9, 1897. Serial No. 626,608. (No model.)

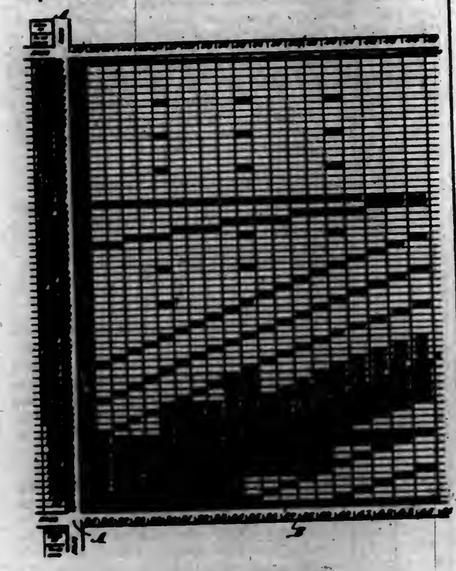
Claim.—1. A rake comprising supporting-wheels, a head, fingers adjustable in said head, a tongue loosely mounted upon the head, and a means for locking the head with relation to the tongue to prevent its rotation, substantially as shown and described.

2. A rake comprising a head, supporting-wheels mounted upon the ends of said head, the head formed with vertical recesses, collars secured upon opposite sides of the head, fingers passing through the collars and the recesses of the head, a means for adjustably securing the fingers within the collars, a tongue loosely mounted upon the head, and a means for locking the head to the tongue and releasing the same therefrom, substantially as shown and described.

3. A rake comprising a head, supporting-wheels journaled upon each end of the same, a collar upon the central portion of the head, oppositely-extending shoulders upon the collar, a tongue loosely mounted upon the head, a dog pivoted in the tongue and adapted to engage the notches of the collar, an operating-lever, a link connecting the opposite end of the dog with the operating-lever, weighted arms for assisting in the rotation of the head when released by the dog, adjustable fingers secured to the head, and a means for holding the dog normally in engagement with the notches of the collar, substantially as shown and described.

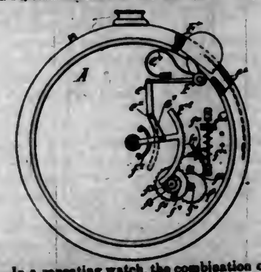
4. A rake comprising a head, fingers adjustably secured in said head and curved at their opposite ends, a three-pronged attachment adapted to be secured to the fingers for converting the same into a three-pronged rake, supporting-wheels for the head, a tongue loosely mounted upon the head, and a means for locking the tongue and head or releasing the same, substantially as shown and described.

602,034. BICYCLE. JOHN P. MURPHY, Adrian, Mich., assignor of two-thirds to James Murphy and Lewis T. Lockner, same place. Filed Sept. 11, 1896. Serial No. 605,521. (No model.)



Claim.—1. In a bicycle, a frame comprising front and rear steering-heads, in combination with front and rear forks having their stems received in said heads, one stem having connection with the handle-bar and the other with the saddle-post, connections between said forks for turning them in opposite directions, propelling mechanism carried by the rear fork, and a stiffening-spring connecting the front fork with the frame carrying the propelling mechanism, substantially as described.

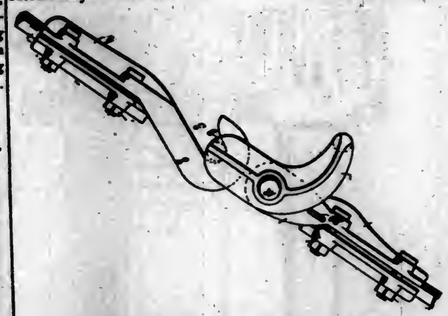
2. In a bicycle, a frame comprising front and rear heads, in combination with front and rear forks having their stems received in said heads and having connection with the handle-bar and saddle-post, crossed connections between said forks, a crank-hanger, bottom runs rigidly connecting said crank-hanger and rear fork, braces connecting the crank-hanger and upper end of the rear-fork stem, propelling mechanism arranged to move with the rear fork and crank-hanger, and a flexible yielding connection between the crank-hanger and front fork, substantially as described.



3. In a bicycle, a frame comprising a front head and a rear head, front and rear forks having their stems arranged to turn therein, connection between said forks for simultaneously turning them in opposite directions, propelling mechanism fixed relatively to one fork, and a yielding connection between the other fork and the part of the frame carrying the propelling mechanism, substantially as described.

602,035. LIFE-INSURANCE TABLE OR CHART. NATHAN P. NEAL, Waxahachie, Tex. Filed Oct. 7, 1897. Serial No. 654,413. (No model.)

Claim.—A life insurance table or chart composed of horizontal and vertical rows of parallelograms, the median and approximately diagonal row of parallelograms containing the number of deaths out of an assumed number of insured persons, annually, for an assumed period, the numbers indicating the years or ages included in such period being inscribed in a vertical column at the side of the table, each number of the series being placed opposite the appropriate horizontal row, and all the parallelograms differing in length according to the mortality of different years or ages, and the parallelograms on the respective sides of the diagonal row or mortuary-line indicating the premiums and the other side the claims, as shown and described.



602,036. REPEATING WATCH. CHARLES PEARL, New York, N. Y., assignor of three-fourths to Levy, Dreyfus & Co., same place. Filed Oct. 24, 1896. Serial No. 609,990. (No model.)

Claim.—In a repeating watch, the combination of a pusher projecting outside of the watch a spring-actuated elbow-lever actuated by said pusher, an oscillating motor-segment pivoted to the movement-plate, a pivot-link connecting the elbow-lever with the toothed segment, a pawl and ratchet-wheel, a pinion arranged between the pawl and ratchet-wheel and said motor-segment, said pinion being engaged by said motor-segment, a train of transmitting gear-wheels operated by the pawl and ratchet-wheel, a spur-wheel actuated by the last gear-wheel of the train of transmitting gear-wheels, a worm engaged by the teeth of said spur-wheel, and a fly on the worm-shaft, substantially as set forth.

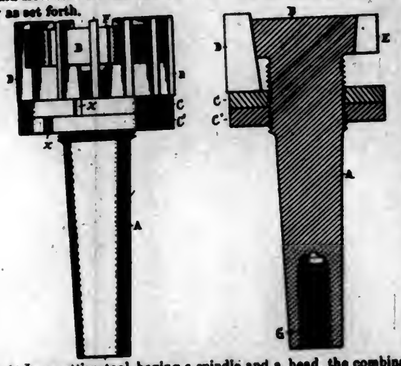
602,037. DISCONNECTING-COUPLING FOR PULL-RODS. MICHAEL S. SCHALL, Lima, Ohio, assignor of one-half to George H. Mosby and Stewart M. Brice, same place. Filed June 15, 1897. Serial No. 641,203. (No model.)

Claim.—1. In a coupling for rods, or the like, to be used in the transmission of power, the combination of a hook having a shank portion adapted to be clamped onto a rod or other part to be connected up, a yoke having in one end a cross-bar with which said hook is adapted to engage, a clevis provided with an eye in one end and having a shank portion adapted to be clamped onto another rod or part to be connected up, and a pivot pin or bolt secured through the said clevis-eye and through holes in the sides of the said yoke, substantially as described.

2. In a coupling for rods, or the like, to be used in the transmission of power, the combination with a hook adapted to be clamped to one rod or part, and a clevis adapted to be clamped to another rod or part and having an eye in one end, of a yoke having cross-bars in its ends and provided with holes intermediate its ends, and a pivot pin or bolt adapted to be secured in the holes of said yoke and extended through the eye of the clevis, substantially as described.

3. In a coupling for rods, or the like, to be used in the transmission of power, the combination of a hook having a clamping-shank for connection with a rod of wood, iron, wire or cable or other part, a clevis having a clamping-shank for connection with another rod or part, the said clevis being provided with an eye in one end and having legs on its opposite sides, a yoke having cross-bars at its ends and provided in its sides with holes intermediate said bars one of said bars being adapted for engagement of the hook, and a pivot, pin or bolt secured in the said holes of the yoke and extended through the eye of the clevis, substantially as described.

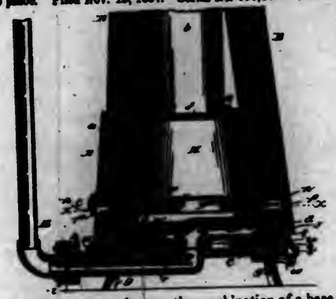
602,038. VEHICLE-TIRE. WILLIAM A. SHULER, Arcanum, Ohio. Filed Oct. 9, 1896. Serial No. 608,247. (No model.)



Claim.—In a vehicle-tire, the rim *a*, the metallic tire *b* secured to the rim, and which tire is wider than the rim so that the edges of the tire project beyond the sides of the rim; and the rubber tire *g*, having projecting portions *c* which cover the edges of the metallic tire and extend along the sides of the rim; combined with the sheet-metal clamps which have their inner edges secured to the sides of the rim, and which are curved outwardly and thickened at their outer edges, the said thickened edges catching in recesses formed in opposite sides of the rubber tire, whereby the rubber tire is clamped in position against the metal tire and opposite sides of the rim, substantially as shown and described.

602,039. MILLING-CUTTER. LUKE SMITH, Easton, Pa., assignor of one-half to George H. Pfell, same place. Filed Jan. 6, 1897. Serial No. 618,114. (No model.)

Claim.—1. In a cutting-tool with a spindle and a head, having radial taper-slots cut in its periphery, the combination of detachable taper-cutters loosely fitting in said slots, with means for adjusting the position of said cutters as a whole while permitting the individual adjustment of the cutters, and means for holding said cutters in place when adjusted, substantially as set forth.



2. In a cutting-tool having a spindle and a head, the combination of detachable taper-cutters fitting in taper-slots of the periphery of said tool, with means for adjusting the position of said cutters so as to vary the diameter of the cutting edge of said tool, slots in the head of said tool and dowels fitting into and expanding said slots to hold the cutters in the head of said tool, substantially as set forth.

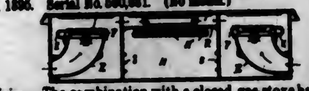
3. In a cutting-tool having a spindle and a head, the combination of detachable taper-cutters fitting in taper-slots in the periphery of the head of said tool, with a nut on said spindle for varying the diameter of the cutting edge of said cutters, a lock-nut on said spindle, slots in the head of said tool, and dowels fitting into and expanding said slots to hold the cutters in the head of said tool, substantially as set forth.

4. In a cutting-tool having a spindle and a head, the combination of detachable taper-cutters D fitting in taper-slots E, an adjusting-nut for moving said cutters in said slots, a locking-nut, and slots and dowels in the head of said tool for pinching said cutters in position when adjusted, substantially as set forth.

602,040. WATER-HEATER. CHARLES R. TYLER and CHARLES F. PRIME, Brooklyn, N. Y.; said Tyler assignor to Charles F. Walther, same place. Filed Nov. 13, 1897. Serial No. 658,408. (No model.)

Claim.—1. In a water-heater, the combination of a base or table having a circumferential groove or channel and a passage or pipe in its under side and leading up through its center, a burner supported above said base or table and having a pipe or passage connecting with the passage in the base, and discharging within the burner, a shell or casing surrounding the burner and having its lower edge seated in the groove or channel of the base so as to make a tight joint therewith, means for detachably locking the shell or casing to the base and means for admitting air to the burner.

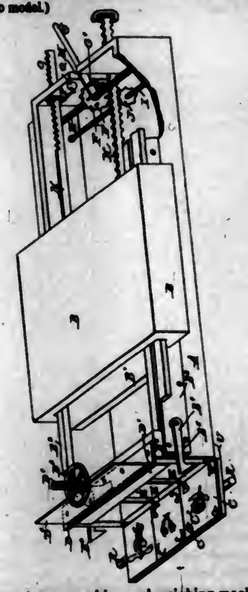
2. A heater adapted to be placed in or under water and consisting of a base formed integrally with a pipe or passage, and means connecting the same with a gas-supply pipe, said pipe or passage opening up through the center of the base; a two-part burner, one of whose members is formed rigid with a pipe or passage which connects at one end with the passage in the base and whose opposite end discharges into the burner, and an exterior shell or casing and means for detachably locking it to the base, and making a tight joint therewith, said shell or casing having an expanded or enlarged annular portion in line with the burner-openings.



3. In a heater to be placed in or under water, the base or table and the burner and means for admitting gas thereto, in combination with a shell or casing surrounding the burner and made rigid with air-feeding pipes or tubes, a cylinder inside of the shell or casing and secured directly on top of the burner, and located in the upper part of the shell or casing, and a flue or pipe of reduced diameter leading from the upper part of said shell or casing.

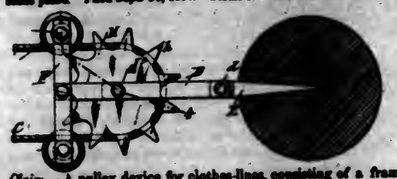
4. The combination with the base or table, a burner supported above the same and means for supplying gas thereto, of an exterior shell or casing tapering from its bottom upwardly and made rigid with air-feeding tubes and a central flue of reduced diameter, said shell or casing having an expanded portion or annular enlargement approximately in line with the burner outlets or openings.

5. The combination of the base, the burner, the exterior shell or casing having a flange around its lower portion, the locking devices for the shell consisting of vertically-disposed bars placed around the base and having shanks fitting openings therein, curved transverse bars on the upper ends of the vertical bars, and adapted to engage the said flange of the shell, and levers pivotally secured to the shanks of the vertical bars and having cam-heads to engage the base whereby the upper transverse bars draw the shell or casing down on the base to make a tight joint, and means for feeding gas and air to the burner.



6. An improved water-heater consisting of a base formed integral with a gas-supply passage and annular groove or channel, a burner having a gas-passage communicating with the passage in the base, an interior cylinder secured to the top of the burner, an exterior shell or casing seated on the base and made rigid with air-feeding pipes and having a central flue of reduced diameter, leading from its upper end, means for detachably locking the shell or casing to the base, means for supplying gas to the burner and a pilot-light consisting of a tube to be passed into one of the air-feeding tubes to ignite the gas at the burner.

602,041. GAS-STOVE. PETER G. VAN WIE, Piqua, Ohio, assignor to the Favorite Stove and Range Company, same place. Filed Aug. 27, 1895. Serial No. 560,661. (No model.)



Claim.—The combination with a closed gas-stove having a closed compartment in its upper portion, of a tubular air-supply flue communicating at its lower end with the atmosphere, through the side of the stove, and projecting at its upper end into said compartment, an annular gas-burner secured upon the upper, discharge end of said flue, a gas-supply pipe for supplying gas to said burner, and a deflector-plate arranged centrally within the burner, substantially as specified.

602,042. BUTTER PRINTER AND WEIGHING MACHINE. ALFRED C. DODGE, Binghamton, N. Y. Filed Feb. 18, 1897. Serial No. 624,005. (No model.)

Claim.—In a butter working and weighing machine, the combination with the box A having the sliding pressure-tight cover B and the adjustable retaining and printing door C, with the cutting-knife D^4 operating directly back of said door, the plunger V to which is attached the notched computing and weighing bar N engaging the bell Q by means of the trip-hammer P, the bell Q, the trip-hammer P, and the cog-actuated plunger-shaft K operated by the ratchet-wheel F and lever G; as described and specified.

602,043. CLOTHES-LINE PULLEY. HERMAN BOEHM, New York, N. Y., assignor of two-thirds to Bernhard Liebig and Charles Sandberg, same place. Filed Sept. 30, 1897. Serial No. 653,680. (No model.)

Claim.—A pulley device for clothes-lines, consisting of a frame adapted to be attached to a suitable point of support, a pair of idle-pulleys mounted on said frame, and a double-toothed wheel also mounted on said frame in a plane parallel with the pulleys, said wheel being arranged between and adjacent to said pulleys, whereby the teeth thereon are adapted to cooperate with said pulleys, substantially as set forth.

602,044. MEANS FOR PREVENTING FRAUD IN CONNECTION WITH CONTENTS OF BOTTLES OR THE LIKE. GEORGE H. GRAPES, Wellington, New Zealand, assignor of one-half to Alfred O'Brien, Sunnerfield, England. Filed Oct. 28, 1897. Serial No. 656,711. (No model.)

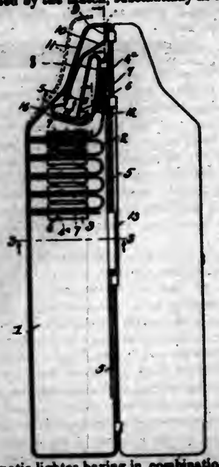
Claim.—1. A safety device for bottles and the like consisting of a thin piece of metal secured transversely in the bottle-neck, and a depending hook secured to the cork or stopper, said hook being arranged to pass under the transverse piece when inserted into the bottle-neck and adapted to engage with and break the said piece when the cork or stopper is withdrawn.

2. A safety device for bottles and the like consisting of a wire secured transversely in the bottle-neck, and a cork or stopper carrying two oppositely-disposed hooks having bent-up extremities, the ends of which approach each other to provide a guideway for the wire during the insertion of the cork or stopper into the bottle neck, said hooks being arranged so that one of them will engage with and break the wire when the cork or stopper is withdrawn from the bottle.

3. A safety device for bottles and the like consisting of a wire secured transversely in the bottle-neck, a hook for engaging said wire, and a screw-stem on said hook for securing it in the cork of the bottle, substantially as described.

4. A safety device for bottles and the like consisting of a wire secured transversely in the bottle-neck, two pieces of metal having bent-up extremities for engaging said wire, and a screw-stem secured to said pieces for connecting them to the cork or stopper substantially as described.

5. A safety device for bottles and the like consisting of a wire secured transversely in the bottle-neck, two pieces of metal having bent-up extremities for engaging said wire, a screw-stem secured to said pieces, and prongs secured to said screw-stem for preventing it turning relatively to the stopper in which it is secured, substantially as described.



6. The combination with a bottle-neck, of a stopper for the same, a wire secured transversely in said neck, and means carried by and depending from the stopper for engaging with the transverse wire to break the same when the stopper is withdrawn, substantially as described.

7. The combination of a bottle-neck, a stopper for the same, a wire fixed transversely in said neck, a pair of pieces having overlapping hooked extremities for breaking said wire as the stopper is withdrawn, and a screw-stem secured to said pieces for connecting the same to the stopper substantially as described.

8. The combination of a bottle-neck, a stopper for the same, a wire fixed transversely in said neck, a pair of pieces having overlapping hooked extremities for breaking said wire as the stopper is withdrawn, a screw-stem secured to said pieces for connecting the same to the stopper, a transverse metal piece secured to said screw-stem, and prongs on said transverse piece for preventing the screw-stem from being screwed out of the stopper, substantially as described.

602,045. AUTOMATIC LIGHTER. DELIA K. HAWLEY, Chicago, Ill., assignor to the Rathbun Manufacturing Company, same place. Filed Sept. 17, 1897. Serial No. 651,971. (No model.)

Claim.—1. An automatic lighter having in combination a box or receptacle for containing a strip of connected matches, an ejector for forcing said matches from said box, said box being provided with an opening and a spring-tongue closing said opening, and an igniter having a portion adapted to bear against and deflect said tongue before the latter is reached by the match, substantially as set forth.

2. An automatic lighter having in combination a box or receptacle for containing a strip of connected matches, an ejector, a flexible guide arranged adjacent to the line of movement of said ejector, a dog arranged at the lower or inner end of said guide for preventing retrograde movement of the match, and an igniter arranged at the other end of said guide, substantially as set forth.

3. An automatic lighter having in combination a box or receptacle for containing a strip of connected matches, and being provided at one end with an opening and a spring-tongue closing said opening, an ejector for forcing said matches through said opening and means for deflecting said tongue and igniting the match before the latter reaches the tongue, substantially as set forth.

4. An automatic lighter having in combination a box or receptacle for containing a number of connected matches, an ejector having a point for ejecting said matches, said box being provided with an opening for the passage of the matches and a spring-tongue for closing said opening and having a notch adapted to fit around said point after the match is ejected, and an igniter arranged in the line of movement of the match, substantially as set forth.

5. An automatic lighter having in combination a box or receptacle, an ejector arranged against one side thereof and having a slide 13 turned over and embracing said side, and a cover to said box fitting against said ejector and holding the same in place, substantially as set forth.

6. An automatic lighter having in combination a box or receptacle, an ejector consisting of a flat strip arranged against one side thereof and having a slide 13 turned over and embracing said side, and a cover for said box having the cut-away portion 14 forming a slot for the movement of said slide, said ejector having a portion projecting beyond or below said slot and fitting under said cover, substantially as set forth.

7. An automatic lighter having in combination a box or receptacle, an ejector, the igniter 9, guide-spring 8 and spring-dog 12 formed in one piece and secured in said box, substantially as set forth.

8. An automatic lighter having in combination a box or receptacle, an ejector, a spring-strip having one end pointed and arranged adjacent to the line of movement of said ejector and constituting an igniter, the intermediate portion of said strip being doubled backwardly upon itself to form the spring-guide 8 adjacent to the line of movement of said ejector and the spring-dog 12 composed of a tongue struck up from said strip and projecting toward said ejector, substantially as set forth.

9. An automatic lighter having in combination a box or receptacle, an ejector, a spring-strip bent to form an igniter 9 and guide-spring 8, a tongue struck up from the bottom of said box and passing through said spring-strip and the lug 15 struck up from said box and bearing against said strip at another point, substantially as set forth.

10. An automatic lighter having in combination a box or receptacle, an ejector, a strip having one end pointed to form the igniter 9, bent to form the shoulder 10, doubled back upon itself to form the guide spring 8 adjacent to the line of movement of the ejector,

the dog 12 struck up from said strip and the guide 16 rounded off from said dog, and a spring-tongue for closing the aperture of the box arranged adjacent to a part of said strip and adapted to be deflected thereby, substantially as set forth.

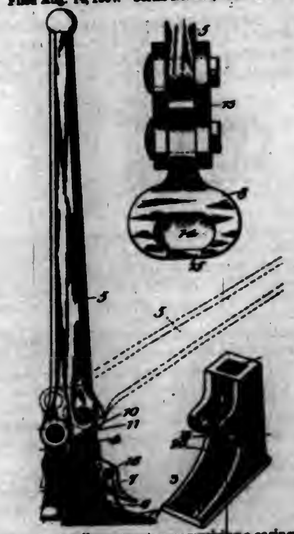
602,046. HORSESHOE. WILLIAM S. HYDE, Dover, Md., assignor of one-half to James H. Wilson, same place. Filed Nov. 3, 1897. Serial No. 657,305. (No model.)

Claim.—1. A horseshoe composed of an upper plate and a lower plate respectively provided with close-fitting mortises and tenons, the said upper plate being provided on its bottom with tubular internally-screw-threaded bosses, and the said lower plate having on its top annular bosses to loosely engage the said tubular bosses of the upper plate, and provided on its bottom with recesses, an elastic plate interposed between the said upper shoe-plate and lower shoe-plate, and screw-bolts engaged in the tubular bosses of the upper plate and having the heads of said bolts loosely inclosed in the recesses in the bottom side of the lower plate, substantially as and for the purposes described.

2. In a horseshoe, the combination of an upper shoe-plate adapted to be nailed to the hoof and provided with a number of mortises and with circular openings that are surrounded on the bottom of said plate by tubular internally-screw-threaded bosses and concentric annular recesses, a lower shoe-plate having its top provided with tenons to closely engage said mortises and with annular bosses to loosely engage said tubular bosses, and having circular recesses in its bottom, an elastic and perforated plate interposed between the said upper shoe-plate and lower shoe-plate, and screw-bolts to secure the said plates together, the said screw-bolts being engaged in the tubular internally-screw-threaded bosses of the upper plate and having their heads loosely inclosed in the recesses in the bottom of the lower plate, substantially as and for the purposes described.

602,047. ANTIFRICTION-BEARING. CHARLES B. HOBSON, Boerne, Tex., assignor of one-half to Samuel S. Eveland, Philadelphia, Pa. Filed Apr. 24, 1897. Serial No. 633,748. (No model.)

Claim.—1. An antifriction-bearing comprising a series of rollers, roller-supports at opposite ends only thereof and having inwardly-projecting lugs formed with roller-sockets between them, a ring removably secured to one of the roller-supports and closing the ends of the roller-sockets to prevent endwise displacement of the rollers, means for closing the sockets in the other roller-support, a shaft or journal against which the rollers bear throughout their entire lengths and a casing against which the rollers bear throughout the greater portion of their lengths.



2. The combination of the rollers, the roller-supports having individual sockets for the rollers, and balls arranged in said individual roller-sockets at the ends of the rollers.

3. The combination of the rollers, roller-supports formed with a series of roller-sockets, devices for closing the ends of the sockets, and balls extending partially through the openings in said closing devices and bearing against the ends of the rollers.

4. An antifriction-bearing comprising a series of rollers, roller-supports at opposite ends thereof having inwardly-projecting lugs formed with roller-sockets between them, a ring removably secured to one of the roller-supports, and detachably connected with it, means for closing the sockets in the other roller-support, balls arranged individually in the roller-sockets and interposed between the ends of the rollers and the ring, a shaft or journal against which the rollers bear throughout their entire lengths, and a casing against which the rollers bear throughout the greater portion of their lengths.

5. An antifriction-bearing comprising a series of rollers, roller-supports at opposite ends only thereof and having inwardly-projecting lugs formed with roller-sockets between them which are open at their inner and outer ends to permit the rollers to bear against the journal and also against the case, and are open at opposite ends to permit endwise movement of the rollers, a ring removably secured to one of the roller-supports and closing the ends of the roller-sockets to prevent endwise displacement of the rollers, means for closing the sockets in the other roller support, a shaft or journal against which the rollers bear throughout their entire lengths, and a casing against which the rollers bear throughout the greater portion of their lengths.

602,048. SPIKE-EXTRACTOR. ANDREW F. JACKSON, Oklahoma, Okla. Filed Aug. 14, 1897. Serial No. 648,360. (No model.)

Claim.—1. A spike-extractor, comprising a casing forming a support, a vertically-movable fulcrum-block mounted in the casing, an operating-lever fulcrumed on the block and arranged to engage the same to limit its movement and permit the device to be swung bodily, and a spike-engaging device carried by the lever, substantially as described.

2. A spike-extractor comprising a casing having a vertical tubular portion and a rearward extension forming a fulcrum, a vertically-movable fulcrum-block mounted in the tubular portion of the casing, a lever fulcrumed on the block and adapted to engage the same to limit its swing, a spike-engaging device carried by the lever, and a pawl mounted on the casing and engaging the block, substantially as described.

3. A spike-extractor, comprising a casing forming a fulcrum, a vertically-movable fulcrum-block mounted in the casing and provided with ratchet-teeth, a pawl mounted on the casing and engaging the ratchet-teeth for holding the fulcrum-block elevated, a lever fulcrumed on the block, and a spike-engaging device carried by the lever, substantially as described.

4. A spike-extractor comprising a casing provided with a straight vertical front face forming a guide, a vertically-movable fulcrum block mounted in the casing, a lever fulcrumed on the block, and a spike-engaging claw guided on the straight front face of the casing and connected with the lever, substantially as described.

5. A spike-extractor comprising a casing provided with side flanges, a vertically movable fulcrum-block mounted in the casing and having its upper end bifurcated and provided between the sides of the bifurcated portions with an inclined shoulder forming a stop, a lever fulcrumed in the bifurcation of the block and having a shoulder arranged to engage said stop to limit its swing, a pawl pivoted between the flanges of the casing and engaging the block, and a spike-engaging device carried by the lever, substantially as described.

REISSUES.

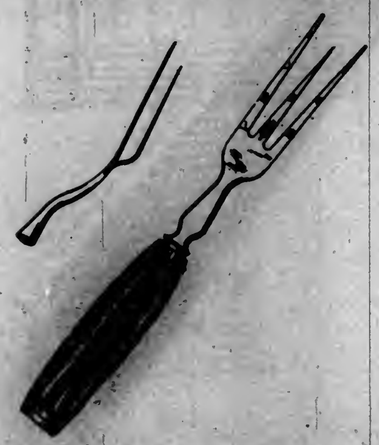
11,659. BLACK DYE AND PROCESS OF MAKING SAME. RAYMOND VIDAL, Paris, France. Filed Feb. 26, 1898. Serial No. 671,903. Original No. 522,120, dated July 17, 1894.

Claim.—1. The process herein described of producing greenish-black, bluish-black and black dyestuffs capable of dyeing the fiber without mordants, which consists in heating ortho or para dioxybenzene, such as quinone, hydroquinone, toluquinone, or pyrocatechin in the presence of sulfur and of ammonia or of substances which are capable of generating ammonia during the reaction, substantially as set forth.

2. The process herein described of producing black dyestuff, by heating hydroquinone in presence of sulfur and ammonia, substantially as set forth.

3. The described black coloring-matters, derived from ortho or para dioxybenzene by heating with sulfur and ammonia, said coloring-matters being soluble in alkalies and alkaline sulfites, and capable of dyeing unmordanted cotton fiber in black or blackish shades, substantially as described.

4. The described coloring-matter derived from hydroquinone by heating with sulfur and ammonia, said coloring-matter being a dark mass, insoluble in water or acids, soluble in alkalies and alkaline sulfites, the alkaline solutions being readily oxidized on exposure to air thereby becoming intensely black, and capable of dyeing unmordanted cotton fiber in black shades, substantially as set forth.

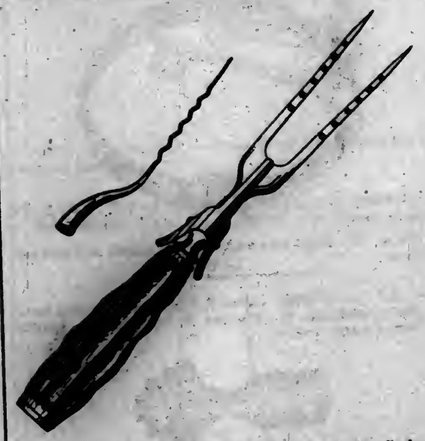


DESIGNS.

28,443. CUFF-BUTTON. HAROLD I. PALMER, Utica, N. Y. Filed Feb. 15, 1898. Serial No. 670,457. Term of patent 7 years.

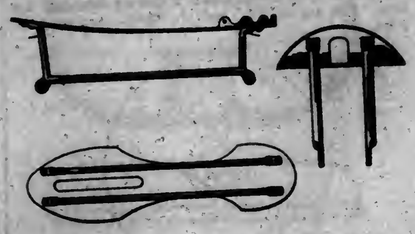
Claim.—The design for the cuff-button herein shown and described.

28,444. CARVING-FORK. CHRISTOPHER RICHARDSON, Howard, N. J. Filed Oct. 6, 1897. Serial No. 654,302. Term of patent 14 years.



Claim.—The design for a carving-fork as herein described and shown.

28,445. CARVING-FORK. CHRISTOPHER RICHARDSON, Howard, N. J. Filed Oct. 6, 1897. Serial No. 654,301. Term of patent 14 years.



Claim.—The design for a carving-fork as herein described and shown.

28,446. CARVING-FORK. CHRISTOPHER RICHARDSON, Howard, N. J. Filed Oct. 6, 1897. Serial No. 654,303. Term of patent 14 years.

Claim.—The design for a carving-fork, as herein described and shown.

28,447. ROLLER-SKATE FRAME. ROBERT REAM, Philadelphia, Pa. Filed Dec. 22, 1897. Serial No. 663,167. Term of patent 7 years.

Claim.—The design for a roller-skate frame herein shown and described.

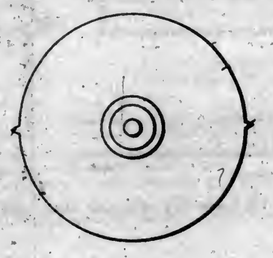
28,448. GARMENT-HANGER. ADELINE M. WALKER, Elizabeth, N. J., and FRANCES C. JACKSON, New York, N. Y. Filed Oct. 1, 1897. Serial No. 653,754. Term of patent 3½ years.

Claim.—The design for a garment-hanger herein substantially as shown and described.

28,449. GARMENT-HANGER. ADELINE M. WALKER, Elizabeth, N. J., and FRANCES C. JACKSON, New York, N. Y. Filed Oct. 1, 1897. Serial No. 653,755. Term of patent 3½ years.

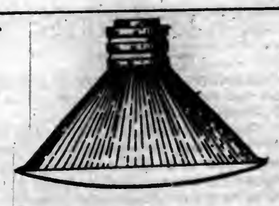
Claim.—The design for a garment-hanger herein substantially as shown and described.

28,450. WAIST-BELT. CELIA KOHLMAN, New York, N. Y. Filed Dec. 9, 1897. Serial No. 661,232. Term of patent 14 years.



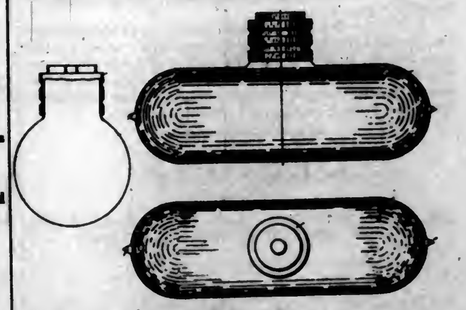
Claim.—The design for a waist-belt, substantially as shown and described.

28,451. BURNER. CARTER H. PAGE, Jr., and ERNEST L. ERNSBERT, Philadelphia, Pa. Filed Mar. 20, 1897. Serial No. 628,263. Term of patent 14 years.

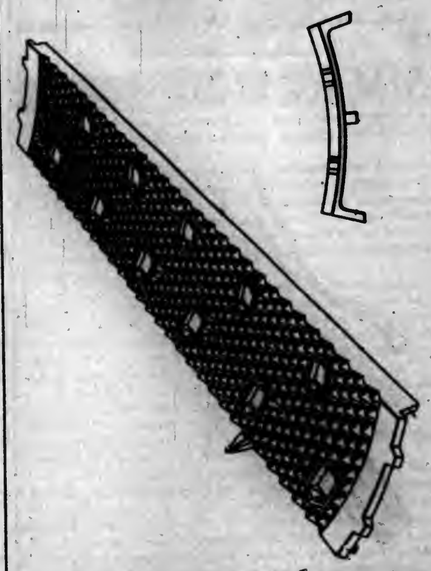


Claim.—A design for a burner for incandescent gas-lights, substantially as shown and described.

28,452. BULB FOR ELECTRIC LAMPS. EDWARD MILLER, Akron, Ohio, assignor of two-thirds to Orlando W. Groff and Anton Rapp, same place. Filed Jan. 20, 1898. Serial No. 668,674. Term of patent 7 years.

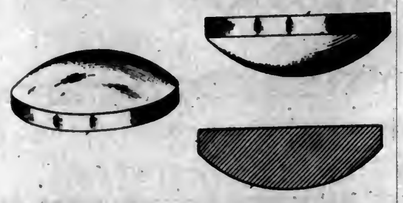


28,452.



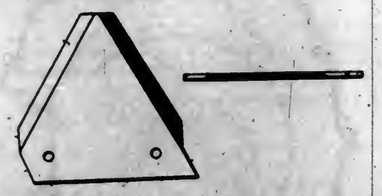
Claim.—The design for a bulb for electric lamps substantially as herein shown and described.

28,453. BULB FOR ELECTRIC LAMPS. EDWARD MILLER, Akron, Ohio, assignor of two-thirds to Orlando W. Groff and Anton Rapp, same place. Filed Jan. 20, 1898. Serial No. 668,675. Term of patent 7 years.



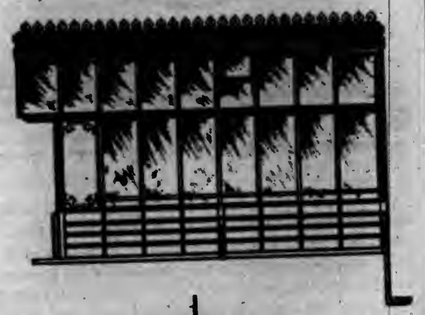
Claim.—The design for a glass bulb for electric lamps substantially as herein shown and described.

28,454. CONCAVE-SECTION FOR SEPARATORS. JOHN M. KAILOR and MARSHAL T. REEVES, Columbus, Ind., assignors to the Reeves & Company, same place. Filed Jan. 20, 1898. Serial No. 668,693. Term of patent 14 years.



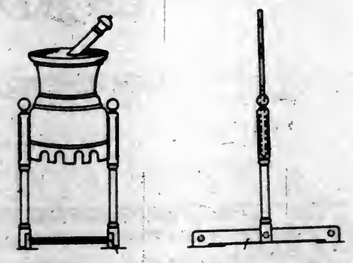
Claim.—The design for a concave-section for separators, substantially as shown and described.

28,455. METAL INGOT. WALTER H. BAKER, St. Louis, Mo., assignor to the National Lead Company, same place. Filed Jan. 24, 1898. Serial No. 667,823. Term of patent 14 years.



Claim.—A design for a metal ingot substantially as herein shown and described.

28,456. SECTION-KNIFE FOR MOWING-MACHINES. WARREN M. BRINKERHOFF, Auburn, N. Y. Filed Mar. 3, 1897. Serial No. 626,900. Term of patent 14 years.

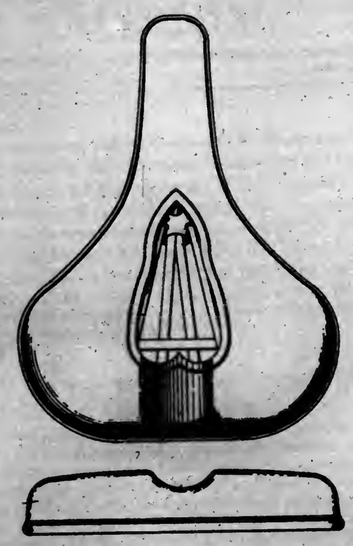


Claim.—The design for a section-knife for mowing-machines, substantially as herein shown and described.

28,457. WAGON BODY AND TOP. SAMUEL VANDUSEN SMITH, Philadelphia, Pa. Filed Jan. 26, 1898. Serial No. 667,926. Term of patent 14 years.

Claim.—The design for a wagon body and top herein shown and described.

28,458. BICYCLE-STAND. HARRY DOLSON and BENJAMIN G. APPLEBY, Saginaw, Mich. Filed Jan. 20, 1898. Serial No. 667,695. Term of patent 7 years.



Claim.—The design for a bicycle-stand as herein shown and described.

28,459. SADDLE-CUSHION. LARKIN ORDERDONK, Winthrop, Mass. Filed June 3, 1897. Serial No. 639,354. Term of patent 7 years.

Claim.—The design for a cushion for saddles, substantially as shown and described.

28,460. BICYCLE-SADDLE. JONATHAN A. HUNT, Westborough, Mass. Filed Dec. 6, 1897. Serial No. 660,973. Term of patent 14 years.

Claim.—A design for a bicycle-saddle, substantially as shown and described.

TRADE-MARKS

REGISTERED APRIL 5, 1898.

81,453. PROPRIETARY MEDICINES FOR COLDS AND KINDRED COMPLAINTS. De Land Medical Company, Boston, Mass. Filed Jan. 24, 1898.

DE LAND'S

Essential feature.—The words "De Land's" and a representation of a man on horseback. Used since January 1, 1898.

81,454. CERTAIN NAMED PROPRIETARY MEDICINAL PREPARATION. Dees Chemical Company, St. Louis, Mo. Filed Feb. 24, 1891.

NEUROSINE

Essential feature.—The word "Neurosine." Used since February, 1891.

81,455. BICYCLES. The Columbus Bicycle Company, Columbus, Ohio. Filed Aug. 23, 1897.

Essential feature.—The letter "C" with a pictorial representation of the landing of Columbus upon a disk having a surrounding circle and radial lines representing a vehicle-wheel. Used since December, 1896.

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

FREEMAN v. BERNSTEIN *et al.*

Decided March 19, 1898.

INTERFERENCE—PAPER EXHIBITS, REPRODUCTION OF—DISCRETIONARY POWER OF THE COMMISSIONER TO REQUIRE.

The rules of the Patent Office do not require that paper exhibits should be reproduced, so that copies may be furnished for the convenience of the various tribunals of the Office and for the counsel for the adverse parties. In the absence of such rule it is not within the discretion of the Commissioner of Patents to make such requirement.

APPEAL on motion.

ELECTRIC-LIGHTING SYSTEM.

Application of Walter K. Freeman filed April 25, 1888, No. 271,986. Application of Alexander Bernstein filed August 4, 1887, No. 246,105. Application of Rudolph M. Hunter filed June 18, 1887, No. 241,729. Application of Elihu Thomson and Edwin J. Houston filed February 19, 1887, No. 228,183. Application (reissue) of The Westinghouse Electric Company and John D. Gibbs filed August 6, 1889, No. 319,955.

Messrs. Church & Church for Freeman.

Mr. J. W. Smith and *Mr. H. S. Mackaye* for Bernstein.

Mr. R. M. Hunter pro se.

Mr. H. C. Townsend for Thomson and Houston.

Mr. H. S. Mackaye for The Westinghouse Company and Gibbs.

DUELL, *Commissioner:*

This is an appeal by Hunter from the decision of the Examiner of Interferences granting the postponement of the hearing for a period of thirty days and also requiring him to reproduce his paper exhibits and furnish copies thereof to opposing counsel.

Upon the hearing Hunter abandoned his appeal so far as it related to the postponement of the hearing for the reason that the thirty days' extension granted by the Examiner had then expired. This only leaves for review the action of the Examiner of Interferences in requiring Hunter to reproduce his paper exhibits. The Examiner of Interferences in granting the motion for the reproduction of the exhibits said:

So far as the Examiner is aware, this is a question without a precedent.

That paper exhibits should be reproduced so that copies can be furnished for the convenience of the various tribunals of the Office and for the counsel for the adverse parties is not required by any rule of the Office. In the absence of such rule I cannot agree with the Examiner of Interferences in his statement—

that it is within the discretion of the Commissioner to make such a requirement.

Interference proceedings have become so onerous to the parties involved that I am unwilling to strain any rule that would result in placing additional burdens upon parties to such proceedings. The interference proceedings are now too expensive and complicated.

I fail to see any ground for the statement that Hunter's record will be unintelligible without copies of his paper exhibits being furnished. If Hunter's record is not intelligible with the originals, it will certainly not be made more intelligible by any number of reproductions furnished for the convenience of the Office and counsel. The argument advanced by counsel for Freeman that if an appeal to the court be taken the exhibits will have to be reproduced and therefore they should now be furnished is clearly untenable. Such contingency has not yet arisen, and it is unnecessary at this stage of the proceedings to provide for it. Even were an appeal to be hereafter taken, it cannot now be said which party would have to bear the expense of printing the records.

The action of the Examiner of Interferences in requiring Hunter to print his paper exhibits is reversed.

I have been asked to direct the Examiner in setting another date for final hearing to consider the magnitude of the records. The Examiner will of course give a reasonable time for counsel to prepare their arguments; but in view of the fact that this interference has been pending for many years I also call his attention to the fact that the public have some rights and that therefore as early a date of hearing should be set as is compatible with the interests of the parties.

MOWER v. CRISP AND COPELAND.

Decided March 25, 1898.

1. INTERFERENCES—REDUCTION TO PRACTICE—LACHES IN APPLYING FOR PATENT—RIVAL INVENTORS—ESTOPPEL.

Where an inventor is guilty of laches in putting aside a machine for eleven years after it was perfected and tested, he is estopped by such laches from receiving a patent by reason of the entrance into the same field of a rival inventor who reduced the invention to practice, obtained a patent, placed the invention on the market, and gave to the world the knowledge and use of such invention.

2. SAME—PRIORITY—ESTOPPEL—RIGHT TO A PATENT.

While M. was the first to reduce to practice and therefore entitled to an award of priority, yet on account of laches in applying for a patent he is not entitled to a patent, and the Examiner directed to reject the claims of M. involved in the interference after final award of priority.

APPEAL from Examiners-in-Chief.

TACK-DRIVING MACHINE.

Application of Samuel E. Mower filed May 14, 1894, No. 511,089. Patent granted Joseph E. Crisp and Geo. W. Copeland June 30, 1891, No. 455,174.

Messrs. Crosby & Gregory and *Mr. Fred. P. Fish* for Mower.

Mr. E. P. Howe and *Messrs. Phillips & Anderson* for Crisp and Copeland.

DUELL, *Commissioner*:

This is an appeal by Crisp and Copeland from the decision of the Examiners-in-Chief affirming the decision of the Examiner of Interferences awarding priority to Mower.

The issue is:

In a hand tacking and loading machine the combination of a suitable tack-driver, a tack-loader and loading mechanism, with a tack-chute composed of two parts, one part fixed to the tack-driving device, and the other part fixed to the loading mechanism, and means for connecting and disconnecting the same, for the purposes set forth.

Both the Examiner of Interferences and the Examiners-in-Chief found that Mower in 1881 made a practically successful machine which embodies the subject-matter of the issue. This finding is abundantly warranted by the testimony. This machine was, in 1882 and 1883, tested with satisfactory results.

All this occurred long prior to any conception or reduction to practice by Crisp and Copeland. Priority is therefore awarded to Mower.

Were no other questions involved than that of priority, it would be unnecessary to add further to this decision. The record, however, raises another question which is not so easy of solution.

The proofs show that after such tests were made in 1882–3 the exhibit machine was laid aside for some eleven years. Meanwhile Crisp and Copeland conceived the same invention, reduced it to practice, applied for and obtained a patent, and placed the invention upon a large scale on the market, and the public through them acquired knowledge of the invention and the right to use the same, some four hundred machines being put on the market by their assignee before Mower took any steps to obtain a patent or put the invention into use. It was not until the Crisp and Copeland patent had been issued for nearly three years and the machines had been placed upon the market for nearly two years in New England, where Mower lived, that the Mower application was filed. Even then neither Mower nor Henry G. Thompson, who claimed to be the equitable if not the legal owner of the invention, took any steps to apply for a patent; but the initiative was taken by one Hurd, the agent of a corporate rival of the corporation owning the Crisp and Copeland patent, who obtained from Mower, through Thompson, the execution of an application by Mower and its assignment to such corporation. It will be seen that the invention in controversy was not given to the public by Mower, but by Crisp and Copeland.

Pending these interference proceedings the question of abandonment was raised by the attorney for Crisp and Copeland, and by consent of the attorneys for the respective parties the application of Mower was remanded to the Primary Examiner to consider that question. It was decided adversely to Mower by the Examiner, and thereupon Mower took an appeal to the Examiners-in-Chief. They reversed the Examiner, holding that the excuse given by Thompson why an application was not filed by Mower was sufficient and abandonment had not been proved. Mower seems to have not known why the application was not prosecuted. Thompson says it was because he had parted with his rights in certain patents and that he was not being treated fairly and so determined to withhold any application by Mower until about the time when such prior patents would expire; but in my opinion the testimony does not show that such patents were dominating patents, so as to warrant the delay on the part of Mower, for at the best they would only prevent the *full* enjoyment of the invention, for Mower's application states that the invention is useful—

in the producing of boots and shoes, and for many other purposes in the arts.

While actual abandonment may not have been proved, yet a more serious question is raised by counsel for Crisp and Copeland—*i. e.*, that Mower and his assignee are estopped by their laches in sleeping upon their rights and allowing another to enter the field, obtain a patent, put the invention into public use, and give to the public the right to use the same, which right is embraced by the public.

I am clearly of the opinion that Mower and his assignees, who are in no better position than he, were guilty of laches in putting aside the machine for some eleven years after it was perfected and tested, and that they are estopped by such laches from receiving a patent by reason of the entrance into the same field of rival inventors who reduced the invention to practice, obtained a patent, placed the invention upon the market, and gave to the world the knowledge and use of the invention, in return for which, I apprehend, is found the consideration which induced the framers of the Constitution to grant therein the power to Congress to promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries. This conclusion is supported more or less forcibly by various authorities.

In the case of *Kendall et al.* v. *Winsor* (21 How., 322, 328) Mr. Justice Daniels, speaking for the Supreme Court, said:

The true policy and ends of the patent laws enacted under this Government are disclosed in that article of the Constitution, the source of all these laws, viz: "to promote the progress of science and the useful arts," contemplating and necessarily implying their extension, and increasing adaptation to the uses of society. (*Vide* Constitution of the United States, Art. I, sec. 8, clause 9.) By correct induction from these truths, it follows, that the inventor who designedly, and with the view of applying it indefinitely and exclusively for his own profit, withholds his invention from the public, comes not within the policy or

objects of the Constitution or acts of Congress. He does not promote, and, if aided in his design, would impede, the progress of science and the useful arts. And with a very bad grace could he appeal for favor or protection to that society which, if he had not injured, he certainly had neither benefited nor intended to benefit. * * *

It is the unquestionable right of every inventor to confer gratuitously the benefits of his ingenuity upon the public, and this he may do either by express declaration or by conduct equally significant with language—such, for instance, as an acquiescence with full knowledge in the use of his invention by others; or he may forfeit his rights as an inventor by a wilful or negligent postponement of his claims, or by an attempt to withhold the benefit of his improvement from the public until a similar or the same improvement should have been made and introduced by others.

The facts in the case of *Rowley* v. *Mason*, which was an appeal from the Patent Office to the Supreme Court of the District of Columbia, (Vol. 2 *American Law Times Reports*, 106,) were somewhat similar to those in the case at bar. Mason, it seems, perfected his invention in 1859, but failed to file his application until January, 1868, a period of about nine years intervening between the time of the perfection of the invention and the filing of the application. In the meantime, during the year 1866, Rowley, without any knowledge of the invention having been made by Mason, perfected the device which Mason had perfected seven years previously, and filed his application on November 26, 1867. Judge Fisher in deciding this case said:

Upon a careful consideration of all the testimony in the case, I have come to the conclusion, though with much hesitation, that Mason invented the device claimed in this case in the year 1859, and reduced his invention to a fixed, positive, and practical form, and is therefore the first inventor.

I now proceed to the inquiry whether he has or has not forfeited his right to a patent, as against a subsequent, independent inventor, for there is no question in my mind that Rowley is such.

After reviewing the authorities and the facts in the case the judge decided that, although Mason was the first inventor, priority should be awarded to Rowley, and he ordered that a patent be issued to Rowley. In his decision he used this language:

The great object of the patent law is the promotion of the arts and sciences as rapidly as possible, by means of holding out to inventors an exclusive monopoly in their inventions for a limited term; and the principle laid down by Justice Story conforms to the spirit of our patent system. Were it otherwise than he decided, inventors would sleep upon their inchoate inventions and put off their reduction to practical form to a more convenient season, the result of which would be, in many instances, the loss of useful inventions and improvements which they had begun and might well have perfected; while other inventors would be deterred from expending their money and brain-work in perfecting inventions by the apprehension that some more sluggish genius might step in and anticipate the fruits of his labors at the eleventh hour. The same sound policy seems to me to require that, as between two independent inventors, the one who has perfected his invention but chooses to sleep upon it for nine years, or even a less period, and is only aroused from his slumbers by the application of a subsequent inventor for his patent, has no right to complain if that application should meet with success.

After this decision there were certain proceedings conducted in the Patent Office and in the Supreme Court of the District by which Mason obtained a patent, and this patent was in suit in the case of *Consolidated Fruit Jar Co.* v. *Wright*, (6 O. G., 337; 12 Blatchf., 149.) Judge Woodruff in his decision said:

The acts and neglect of Mason, the patentee, amounted to an abandonment of the supposed invention, and of all claim to a patent therefor. It was not until after the several patents above specified had been obtained by others, and after Rowley, in concert with Imlay, had engaged largely in the manufacture, and they had been for very nearly two years extensively sold, that Mason, nine years after his alleged invention, comes forward to claim the exclusive right to make such jars. If he originally might have claimed it, he had slept too long. He had abandoned the manufacture. His instruments of manufacture were lost, or had passed from his possession and control, without an effort to reclaim them. Others having no connection with him had produced and given to the public the benefit of the device he now seeks to claim, and had devoted their time and capital to its production and sale. There was no reason for this delay, if Mason entertained any purpose to pursue the invention or patent it. He had abundant means for this purpose. He actually applied for and received another patent. He apparently applied himself to a totally different subject, so as to indicate that, for some reason, he did not regard the device worthy of further attention, until either the ingenuity or skill, judgment and capital of others, applied to the manufacture and sale, suggested to him that the alleged invention had value. The remarks of Judge Fisher, of the Supreme Court of the District of Columbia, in his opinion in the matter of the interference between the applications of Rowley and Mason, (put in evidence by the complainant,) are forcible and apt to this view of Mason's rights, especially as against Rowley, who, it seems, defends this suit. (*Adams* v. *Jones*, 1 Fish. Pat. Cas., 537; *White* v. *Allen*, 2 Id., 440; *Staples* v. *R. R. Co.*, Id., 532; *Roussos* v. *Mayor*, 1 Id., 538.) As well on the ground of abandonment as on the ground of unnecessary delay and neglect, until Rowley, or Rowley and Imlay, had produced and put the alleged invention into extensive use and on sale, for nearly two years, expending their time, industry, skill, and capital, the patent to Mason must be regarded as invalid.

For, in my opinion, is it material to inquire whether Mason or Rowley did or could have obtained a patent for the combination in question. If an inventor, without substantial reason or excuse, abandons the use of his invention, and for nine years sleeps on his rights, and in the meantime others, in good faith, employ their industry, skill, and money in producing the same thing, and give the public the benefit thereof, putting it into extensive use and on sale, such a state of facts not only warrants the inference of abandonment by the first inventor, but it also creates, as between him and the others, the same equity as would arise if such others had gone further and taken out a patent. Whether the device be patented, or has "gone into use without a patent," should make no difference. (*Kendall* v. *Winsor*, 21 How., 322.) This is not because lapse of time, *per se*, deprives an inventor of his right, but because the circumstances giving character to the delay indicate abandonment; and also because the intervening rights of others make it inequitable that he should thereafter be permitted to assert any such exclusive title to the invention.

On appeal to the Supreme Court of the United States (94 U. S., 92) the decision of Judge Woodruff was sustained, the Court finding that the fact that when Mason showed his invention to his attorney in 1859 he was advised that if he patented it he could not use it, as it would infringe earlier patents which he had parted with to others, was not a sufficient reason for the delay in filing the application; that no sufficient reason was disclosed in the record why the application for the patent was not made earlier, and that it was not for want of the necessary pecuniary means on the part of Mason.

Justice Swayne, speaking for the Court, said:

He who is silent when he should speak must be silent when he would speak, if he cannot do so without a violation of law and injustice to others.

The supineness of the patentee is unexplained and inexcusable. A principle akin to the doctrine of equitable estoppel applies.

In the case of *United States Rifle and Cartridge Co.* v. *The Whitney Arms Co.* (11 O. G., 373) Judge Shipman cited the case of *Kendall* v. *Winsor* and the *Fruit Jar Company Case*, *supra*, with approval, in this language:

A person "may forfeit his rights as an inventor by a wilful or negligent postponement of his claims, or by an attempt to withhold the benefit of his improvement from the public until a similar or the same improvement should have been made and introduced by others." (*Kendall* v. *Winsor*, 21 How., 322.) If there was no purpose on the part of Cochran to withhold his improvement from the public, there was a negligent postponement of his claims until after the other inventor had acquired equities which it seems unjust to destroy. The language of Judge Woodruff in *Consolidated Fruit Jar Company* v. *Wright*, (6 O. G., 337; 12 Blatchf., C. C. R., 149,) though not necessary to the decision of that case, is just and pertinent to the facts which are here disclosed.

Mr. Justice Clifford, speaking for the Supreme Court of the United States, in the case of *Bates* v. *Coe*, (16 O. G., 337; 98 U. S., 31, 46,) said:

Inventors may, if they can, keep their inventions secret; and if they do for any length of time, they do not forfeit their right to apply for (obtain) a patent, unless another in the meantime has made the invention and secured by patent the exclusive right to make, use, and vend the patented improvement. Within that rule and subject to that condition, inventors may delay to apply for a patent.

In the case of *Boyd* v. *Cherry* (4 McCrary, 70, 76) it was said:

The rights of a patentee are granted to him upon the consideration of the giving by him to the public of a new and useful discovery. If some one before him had already given the same invention or discovery to the public, this consideration fails, and he has no basis for his claim of exclusive right. Hence it is that the alleged prior invention must have been made public.

If kept secret by the first inventor until the second has discovered it and given it to the public, the latter will be protected, for it is to him that the public is indebted; it is from him that the public has received value; and as no one can impart that which he does not possess, it must appear that the alleged prior inventor was aware not only of his discovery, but also of its utility.

On this same question Judge Shipman, in the case of *Hubel* v. *Dick*, (36 O. G., 939; 28 Fed. Rep., 132, 140,) used this language:

The question therefore is, should the first inventor, who proceeded with reasonable diligence to perfect an important invention, and who produced a successful machine before the junior inventor's patent was issued, lose his right to the fruit of his invention on account of the delay which he exhibited in applying for his patent? That laches merely in applying for a patent, when there were no laches in otherwise perfecting the invention, may compel an inventor to be deprived of his patent, another inventor having meanwhile given the same invention to the public, is probably true. The remarks of Acting Commissioner Duncan in *Monce* v. *Adams*, (1 O. G., 2,) are important and valuable upon this point. In the case under consideration the utmost time during which the inventor may be chargeable with laches was nineteen months—the interval between the completion of his working drawings and his application for a patent. Ten months elapsed after the completion of the machine. When an inventor of a machine of the important character of either Tucker's or Taylor's, who has been diligent in perfecting and reducing his invention to practice, and in attempts to bring his machine to the knowledge of the public, has merely paused, before applying for a patent, for a period of nineteen months after he completed his working drawings, and ten months after he completed his machine, I cannot say that there were such laches as should deprive him of the reward which ordinarily attends priority of invention. Our inventors are more apt, I suppose, to go into the Patent Office with incomplete inventions than to wait too long after experiment has achieved perfection. A decision which should compel haste in applying for patents before actual practice had tested the truth of the inventor's theory, and had overcome difficulties in the operation of the mechanism, would, I think, be productive of more injury than a decision which, while compelling diligence in perfecting the invention, was indulgent of some delay in seeking the Patent Office.

In this connection see also *Ellithorp* v. *Robertson* (MacA. Pat. Cas., 585, 597) and *Robinson on Patents*, (Vol. 1, secs. 323, 385, and 390.)

Believing that the facts and the law applicable thereto warrant me in holding that Mower is not justly entitled to a patent, I direct the Primary Examiner at the close of the interference proceedings, if priority shall be awarded to Mower by the final tribunal, to reject the claims of Mower involved in this interference.

While the decision of the Examiners-in-Chief upon the question of priority is affirmed, yet Mower is held not to be entitled to a patent.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

GLENN *et al.* v. ADAMS.

Decided February 8, 1898.

1. INTERFERENCE—APPEAL TO COURT OF APPEALS—WEIGHT TO BE GIVEN TO DECISIONS OF PATENT OFFICE.

Where the several tribunals of the Patent Office concur in findings in respect to a mere matter of fact about which testimony is conflicting, *Held* there is no reasonable ground for supposing that the Court of Appeals of the District of Columbia will reverse those findings unless it be shown clearly and beyond reasonable doubt that there had been error committed in comparing and weighing the evidence.

2. SAME—PRIORITY—DECISION OF COMMISSIONER AFFIRMED.

The decision of the Commissioner of Patents in awarding priority of invention to Adams affirmed.

Messrs. Dodge & Sons for the appellants.
Messrs. Kay & Totten for the appellee.

ALVEY, *J.*:

This is an appeal from a decision of the Commissioner of Patents in an interference proceeding in the Patent Office instituted and declared between the joint application of Harvey S. Glenn and Coulter E. Glenn and a pending application of Samuel Adams for the same or a similar invention. The application of the Glenns was filed on the 22d of March, 1895, and that of Adams was filed on the 11th of February, 1895. The subject-matter of the invention is a supposed new and useful improvement in the mode of constructing cables, ropes, etc., used for drilling oil, gas, and water wells and for all other drilling purposes, etc. The issue declared is as follows:

As an improved article of manufacture, a drilling-cable comprising a wire section and a rope section spliced together.

The structure of the article of the alleged invention would seem to be very simple, though its improvement and utility may be very considerable. The object of the splicing is to secure elastic and springing action in the use of the cable, which is not obtainable from an entire wire cable.

Under the preliminary statements of the parties a considerable volume of testimony was taken, and the whole controversy resolves itself into a few facts, and the testimony in regard to which is exceedingly conflicting. Indeed, the question involved mainly depends upon the credibility of the parties and their witnesses.

Adams alleges in his preliminary statement that he conceived the invention about December 1, 1887, and that he disclosed it to others about December, 1887, or January, 1888; that he made a drawing of it about December, 1887, and at different times since; that he made experimental tests in drilling with the spliced or combined rope about January, 1888, and at different times since, and that he found by such experiments that the invention was practicable; that in the summer of 1894 he gave permission for the use of the combined cable in controversy in the drilling of a well in which the Glenns were employed, and that the invention was during the progress of the work in drilling of that well disclosed to the Glenns, and the use of the invention proved to be successful.

In the preliminary statement by the Glenns they allege that they conceived the invention involved in the issue on or about the 18th of October, 1894, and that they communicated such invention to one or more persons on or about the same date, and that Samuel Adams was one of such persons; that the invention was embodied in a full-sized operative form on or about the 25th of October, 1894, and practically operated at that time; that the device has been in public use from October 25, 1894, and on sale since November, 1894, and that drawings or sketches were made in November 1894.

These respective preliminary statements were sworn to by the parties, and the facts stated therein were substantially testified to by the respective parties when they were examined as witnesses.

The case was carefully considered and the conflicting evidence compared by the Examiner of Interferences, and he awarded priority to Adams. An appeal was taken by the Glenns to the Board of Examiners-in-Chief, and that tribunal upon going over the evidence carefully affirmed the judgment of the Examiner of Interferences, and from the latter ruling an appeal was taken to the Commissioner in person, and he affirmed the previous findings and conclusions.

After these several concurrent findings in the Patent Office in respect to a mere matter of fact, about which the testimony is conflicting, there could be no reasonable ground to suppose that this court would reverse those findings unless it be shown clearly and beyond reasonable doubt that there had been error committed in comparing and weighing the evidence.

We have examined all the testimony with great care—that given by the parties themselves, as well as that given by the disinterested witnesses—and we cannot perceive how the officials of the Patent Office could upon any fair construction of the evidence have made their findings different from those they have made. If we allow that the circumstantial and apparent candid history of the conception and the practical experiments made of it, as furnished in the testimony of Adams, is fairly countervailed by that furnished in the testimony of the Glenns, yet the other witnesses in the case, to say nothing of the onus of proof, would seem to make it clear beyond reasonable doubt that Adams was the first to conceive and to make disclosure to others and was first to make practical experiments of the invention, or, rather, illustrations of it. It is clear also that the conception of the invention was disclosed to the Glenns by Nevin by authority of Adams, and, while the Glenns were the first to apply the invention or device in the actual operation of drilling an oil-well, yet they did so upon the suggestion and urgent request of Nevin and rather against their own judgment as to the practical working of what was to them at the time a doubtful invention of anything useful.

It being made clear by the evidence in the case that the conception of the invention was that of Adams, and that he made full disclosure thereof, and that among those to whom disclosure was made was Nevin, who disclosed it to the Glenns, who had not known of the invention before, it would seem to be but a reasonable conclusion that the application of the invention or device in the drilling of the well upon the suggestion of Nevin should in reason and justice inure to the benefit of Adams as a reduction to practice of his invention. It is immaterial, as said by the Examiner of Interferences, that the cable was made without any instruction or supervision by either Adams or Nevin. The suggestion or request of Nevin that the cable should be made and used was a sufficient disclosure of the invention, and, as said by the Examiner—

the splicing of wire cables and of Manila cables is old and well known, and any skilled workman could, it is believed, readily splice a wire cable to a Manila cable without being instructed as to the manner of doing so, as the mere suggestion would be sufficient for him, and he would exercise no inventive faculty in carrying out the suggestion.

Therefore, Adams being the first to conceive, the first to disclose, the first to reduce to practice, and the first to apply to the Office for a patent, he is entitled to priority on the present issue.

We must therefore order and direct that the proceedings in this case and this decision be certified to the Commissioner of Patents, to be entered of record in the Patent Office, as directed by law, and it is so ordered.

U. S. Circuit Court—District of Connecticut.

BRIGGS v. BUTTERWORTH, COMMISSIONER OF PATENTS.

Decided March 29, 1898.

1. BILL UNDER SECTION 4915, REVISED STATUTES—BRIGGS—ICE-PLANER—REISSUE—RIGHT TO A PATENT.

A bill in equity for a decree that John N. Briggs is entitled to a reissue of Letters Patent No. 367,267 in accordance with the provisions of Revised Statutes, section 4915, dismissed, as the question of patentability of the combination claimed had been substantially passed upon by the Circuit Court of Appeals. (60 Fed. Rep., 87.)

2. DOUBLE USE—PATENTABILITY—POTTS v. CREAGER CONSTRUED.

It is now settled that *Potts* v. *Creager* (70 O. G., 494; 155 U. S., 597) did not announce any new doctrine or modify the existing rules of law. The same principle had already been stated and applied in *Bloch* v. *City of San Francisco*, (118 U. S., 679;) *Pa. R. R. Co.* v. *Locomotive Co.*, (27 O. G., 207; 110 U. S., 490;) *Aron* v. *Railroad Co.*, (49 O. G., 1365; 132 U. S., 186,) and in *Briggs* v. *Central Ice Co.*, (54 Fed. Rep., 376, and 60 Fed. Rep., 87.)

Messrs. Lee & Lee and *Messrs. Pollok & Mauro* for the complainant.
Mr. W. A. Megrath for the defendant.

TOWNSEND, *J.*:

Bill in equity for a decree that applicant is entitled to a reissue of Patent No. 367,267, in accordance with the provisions of Revised Statutes, section 4915. On July 26, 1887, said patent was issued to the complainant for "an apparatus for planing cakes of ice." The first claim in his original application had been rejected and as amended was as follows:

1. The combination, with the cutter-head and the racks directly attached thereto, of the guides for both cutter-head and the racks, arranged perpendicularly to the plane of the elevator, the pinions mounted on said guides and engaging in said racks, and the levers or arms for operating said pinions, all constructed, substantially as described, so that the depth of the cut may be directly and positively regulated by means of the levers, as herein specified.

In a suit for infringement of this claim Judge Coxe held that said claim must be limited to the precise mechanism described and that the claim as thus limited was not infringed. (*Briggs* v. *Central Ice Co.*, 54 Fed. Rep., 376.) Upon appeal the Circuit Court of Appeals held that in view of the prior art the claim was destitute of patentable novelty. (*Briggs* v. *Central Ice Co.*, 60 Fed. Rep., 87.) The complainant thereupon amended his claims and applied for a reissue of said patent. One of the amended claims was as follows:

2. The combination with the cutter-head and the racks directly attached thereto, of the guides for both cutter-head and racks, arranged perpendicularly to the plane of the elevator, the pinions mounted on said guides and engaging in said racks, and the levers or arms for operating said pinions, a cutter consisting of a number of points entering the ice in such a manner as not only to cut but to groove it at one operation and an ice-elevator

adapted to positively force the ascending cakes of ice into contact with the cutter and groover, all constructed substantially as described, so that the depth of the cut may be directly and positively regulated by means of the levers, and the ice at the same time properly grooved for storage.

The only difference between said original and this amended claim consists in the insertion in the latter of the following language:

A cutter consisting of a number of points entering the ice in such a manner as not only to cut but to groove it at one operation and an ice-elevator adapted to positively force the ascending cakes of ice into contact with the cutter and groover.

The Primary Examiner and the Examiners-in-Chief of the Patent Office rejected said claim, and the Commissioner of Patents affirmed the decision of the Examiners-in-Chief. The complainant thereupon appealed to the Court of Appeals of the District of Columbia, which sustained the decision of the Commissioner of Patents in refusing to allow said claim. Complainant thereupon filed this bill.

It is unnecessary here to discuss the construction or operation of the patented machine or the prior art. All these matters have been fully considered in the opinions of the tribunals hereinbefore referred to.

The questions herein presented are as follows:

1. Does the addition of new matter to said claim affect the patentability of the combination?

2. If not, would the Court of Appeals for the Second Circuit have decided differently if their decision had followed instead of preceded *Potts* v. *Creager* (70 O. G., 494; 155 U. S., 597)?

3. Does the discovery of a portion of the Butterfield Patent Office model affect the decision of this controversy?

In the opinion of the Court of Appeals for the District of Columbia (78 O. G., 169) the Court says:

Nor does the addition to the present claim * * * of "a cutter consisting of a number of points entering the ice in such a manner as not only to cut, but to groove it at one operation" add anything new to the combination, for, as we have seen, that cutter was specifically described in reissued Patent No. 11,060, and, besides, was shown in the specification and drawings of No. 367,267. Notwithstanding, therefore, the able and ingenious arguments made on behalf of the appellant, we must say that we think the Commissioner was right in the conclusion that the whole combination had been substantially passed upon by the Circuit Court of Appeals.

After independent examination I concur in this opinion.

It is admitted that the new matter in said claim specifies at most only two new elements:

A cutter consisting of a number of points entering the ice in such a manner as not only to cut but to groove it at one operation.

An ice-elevator adapted to positively force the ascending cakes of ice into contact with the cutter and groover.

But both of these elements are necessarily implied in the original claim, which was held void for want of patentable novelty by the Court of Appeals in *Briggs* v. *Central Ice Co.*, *supra*. In that case the Court, by Judge Wallace, said:

Assuming the ice-elevator, although not specifically mentioned, ought to be regarded as an element of the claim, and recognising the fact, as we must upon the proofs, that the other devices of the claim were never before assembled together in an ice-elevator, nevertheless, we are of the opinion that the claim is destitute of patentable novelty.

The other element, the cutter, must also be regarded as one of the elements covered by said original claim, not only because a cutter is necessary for the operation of said machine but because the original claim specified such a combination with a—

cutter-head that the depth of the cut may be directly and positively regulated by means of the levers.

Even if this were not so this element would add nothing to the novelty of the combination, for precisely such a cutter was described in Briggs's prior reissue patent, No. 11,060.

Whatever uncertainty may have originally existed as to the scope or effect of *Potts* v. *Creager*, *supra*, it is now settled that it did not announce any new doctrine or modify the existing rules of law so far as this case is concerned. The same principle had already been stated and applied in *Bloch* v. *City of San Francisco*, (113 U. S., 679;) *Pa. R. R. Co.* v. *Locomotive Co.*, (27 O. G., 207; 110 U. S., 490;) *Aron* v. *Railroad Co.*, (49 O. G., 1365; 132 U. S., 186,) and in *Briggs* v. *Central Ice Co.*, *supra*, Judge Coxe and the Court of Appeals, affirming his decision, stated and applied the same rule. Judge Wallace says:

When thus assembled together the elevating mechanism performs no new functions, and the adjusting cutter mechanism performs precisely the functions it did in the Butterfield machine. It is wholly immaterial that the adjusting devices of Butterfield were designed to be used in a machine for planing wood. The application of an old organism to an analogous use is not patentable. * * * It is not invention to use an old combination of devices in a new location to perform the same operations, when no changes or modifications are required to adapt it to the new use, or when only such are required as can be made by the exercise of ordinary mechanical skill.

Since the decision of *Briggs* v. *Central Ice Co.*, *supra*, the expert for complainant has discovered the damaged Patent Office model of the Butterfield invention. The experts are at issue as to the purpose for which certain screw-threaded holes and slotted bars were shown in said model and as to the consequent effect to be given to the statement in the Butterfield specification that the knife is adjusted to set at a required thickness. The evidence is not sufficiently definite to narrow the scope of the Butterfield patent as already construed by the various courts.

All the elements of the patented combination were old. The principle of their combined operation was disclosed in the prior art and the modified adjustment and operation required only mere mechanical skill.

Let the bill be dismissed.

Attorneys.

(ORDER No. 1,195.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 9, 1898.

With the approval of the Secretary of the Interior, O. U. Perrin, of Crawfordsville, Ind., is hereby disbarred from practice before the United States Patent Office for gross misconduct, pursuant to the provisions of section 487 of the Revised Statutes.

C. H. DUELL,
Commissioner.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., April 7, 1898.

SIR: The Secretary of the Interior has ordered that Carlton G. Palmer, of Norfolk, Va., be not recognised after this date as agent or attorney in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully,

EDWARD M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., April 7, 1898.

SIR: The Secretary of the Interior has ordered that James A. Vance, of Perryville, Ark., be not recognised after this date as agent or attorney in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully,

EDWARD M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

Money by Mail.

Money sent by mail to the Patent Office will be at the risk of the sender. Letters containing money should be registered.

Disclaimers.

262,576.—*Leroy B. Firman*, Chicago, Ill. IMPROVEMENT IN MULTIPLE SWITCHBOARDS FOR TELEPHONE-EXCHANGES. Patent dated January 17, 1882. Disclaimer filed April 8, 1898, by the present assignee, the *Western Electric Company*, Chicago, Ill.

Enters its disclaimer:

"To the said second claim in the specification of the said Letters Patent, which is in the words following, to wit:

"2. The combination of two or more multiple boards to which the lines of the terminal stations are connected, and means, as described, whereby the switchman may readily ascertain what lines are in use.'"

338,843.—*George Eastman* and *William H. Walker*, Rochester, N. Y. IMPROVEMENT IN APPARATUS FOR MANUFACTURING SENSITIVE PHOTOGRAPHIC FILMS. Patent dated March 8, 1887. Disclaimer filed April 6, 1898, by the present assignee, the *Eastman Kodak Company*, Rochester, N. Y.

Enters its disclaimer—

"To so much of said claim (3) as extends the said claim to include, in combination and arrangement with the other devices recited therein, any hang-up machine other than essentially the hang-up machine described in the specification of the said patent and shown in the drawings thereof, that is to say, a hang-up machine having essentially a carrier mechanism combined with loose rods with which the carrier mechanism is adapted to engage and in conjunction with which it operates to form the paper into loops as it is coated and to support it while drying, the paper hanging substantially at rest with reference to such supports at all times while it is supported thereby.

"And also to that part of the specification of the said Letters Patent on page 3, lines 64 and 65 thereof, which is in the following words, to wit: 'of any approved construction.'"

Regulations in Relation to Mail-Matter.

In order to insure the ready identification of the division from which mail-matter emanating from this Office was sent, and the prepayment of any foreign postage thereon, as well as to prevent the retention for general delivery in the post-office of this city of any wrongly-addressed letter when this Office could supply a fuller or more accurate address, it is directed that the following regulations be observed with reference to all mail-matter forwarded from this Office:

Each envelop forwarded from any division will be stamped or marked in the upper left-hand corner with the division number or letter, as the case may be.

Each envelop addressed to a foreign country must be forwarded to the mail-room and the proper stamps affixed thereto before mailing.

Such mail as is to be delivered in this city shall be directed "Washington, D. C." If a letter addressed to a person in this city and not marked for general delivery be returned to this Office, it will be promptly remailed with an accurate and full local address supplied, if possible. In remailing, the envelop should be marked or stamped "Hold in General Delivery," but no envelop should be thus marked until the address thereon is as full and accurate as the Office can supply. A letter to a person in this city will not be filed "Undelivered" until it is returned to this Office in an envelop thus addressed and marked.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business April 5, 1898.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action.		No. of applications awaiting action.

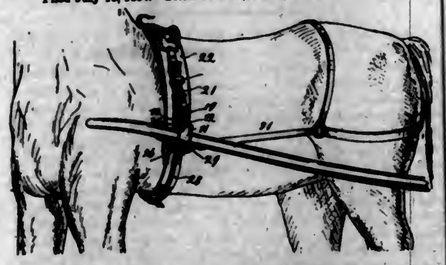
PATENTS

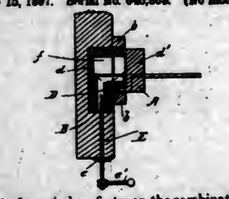
GRANTED APRIL 12, 1898.

602,049. BICYCLE CRANK-SHAFT. George M. Beard, Angola, Ind. Filed Nov. 2, 1895. Serial No. 567,677. (No model.)



Claim.—1. The combination of a two-part bicycle crank-shaft, one part having a cylindrical axle-shaft with notches 12 and alternate recesses upon its inner end, and tapering spindle extension with a screw-threaded end as shown, and adapted to receive a nut thereon, and the other part having a tapering longitudinal tubular opening, and notches 13 at its inner end adapted to receive the spindle end of the opposite part as shown, and the two parts to be rigidly secured together by means of a nut 11 engaged upon the screw-threaded end of the spindle, all substantially as shown and described and for the purpose stated.

2. The combination of a two-part bicycle crank-shaft and axle, one part having a cylindrical axle-shaft with notches 12 cut in the surface of the inner end with alternate recesses and a tapering spindle extension 7 having one or more grooves 8 therein and a screw-threaded end 10, adapted to receive the nut 11, and the other part having a tubular interior longitudinal opening with notches on its inner walls adapted to engage the grooves 8 in the spindle 7 and having also notches 13 at its inner end adapted to engage the recesses between the notches upon the opposite part, and the two parts secured together by the nut 11 upon the screw-threaded end 10 as shown and described and for the purpose stated.



3. A two-part telescopic crank-shaft, one of said parts being tubular and adapted to receive a portion of the other part, flattened surfaces upon the entering part, lugs upon the end of the receiving part, and a locking device entering the tubular or receiving part and engaging the entering portion of the other part, substantially as described.

602,050. SHAFT-TUG. Henry A. Beesley, Portsmouth, Ohio. Filed July 19, 1897. Serial No. 645,014. (No model.)

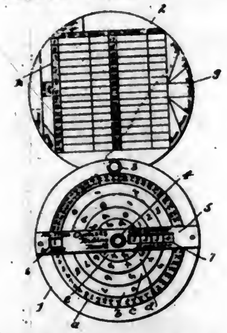
Claim.—In a shaft-tug, the combination of the shaft-bearing 9, upwardly-projecting members 10 and 11, a tongue 12, a pin whereby it is pivotally connected to the upper end of member 10, a coil-spring supported on this pin, a loop 16 secured to the upper end of the tug, and a barrel 17 formed thereat by bending and turning over the upper end of member 10, said barrel forming means for protecting the coil spring mentioned and for securing loop 16 to the tug.

602,051. SASH-FASTENER. Joseph A. Black, Parnell, Iowa. Filed June 15, 1897. Serial No. 640,868. (No model.)

Claim.—1. In a window-fastener, the combination, with a bracket carried by the window-frame and provided with a vertical recess *f'* and a horizontal recess *f*, of a longitudinally-slidable pawl journaled in the said bracket and free to oscillate in a vertical plane while under the recess *f'*, and means for sliding the said pawl into the recess *f* whereby it is prevented from oscillating, substantially as set forth.

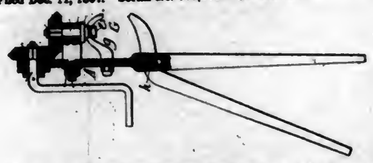
2. In a window-fastener, the combination, with a bracket carried by the window-frame and provided with a vertical recess *f'* and a horizontal recess *f*, of a longitudinally-slidable pawl journaled in the said bracket and free to oscillate while under the recess *f'*, a small rod secured to the pawl at its axis and projecting through the front of the window-frame, and a laterally-projecting handle secured to the said rod and operating to depress the said pawl, substantially as set forth.

602,052. TIRE-PATCHER. Charles A. Bradshler, Canton, Ohio. Filed Nov. 23, 1897. Serial No. 659,598. (No model.)



Claim.—1. The compressible case having removably attached thereto a needle provided at its piercing end with an open slot, a cross-bore or opening located below the bottom of the open slot, and a bore communicating with the slot and the cross-bore, substantially as and for the purpose specified.

2. The combination of a compressible case, a screw-threaded cap provided with short bars removably attached to the compressible case, a yielding cover surrounding the compressible case, and a hollow needle provided with an open slot at its piercing end, substantially as and for the purpose specified.



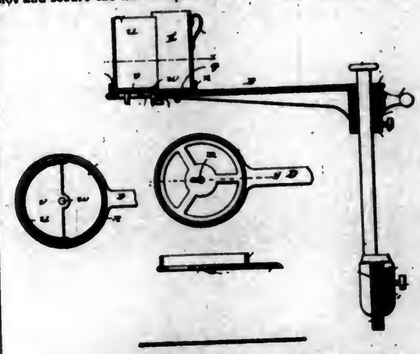
3. The combination of a compressible case, having removably attached thereto a cap and hollow needle, a yielding case surrounding the compressible case, and a casing to receive and hold the compressible and yielding cases, substantially as and for the purpose specified.

602,053. CYCLIST'S RIDING-RECORD. Hiram A. Brooks, Baltimore, Md. Filed July 1, 1897. Serial No. 643,108. (No model.)

Claim.—A device of the character described, comprising a circular cover or disk with a calendar of the months of the year on the back thereof and suitable spaces opposite the months for the purposes set forth, rotatable disks centrally secured to the circular cover or disk, and provided near their peripheries with numerals, said disks being adapted to rotate independently of each other, a strip secured to the cover or disk at either side thereof and provided with a slot or opening adapted to come opposite the numerals on the largest disk, and a slot at the other end adapted to come opposite the numerals on the remaining disks when they are alined, a disk pivotally secured to the disk 1, and provided on its inner face with a calendar indicating the days of the month, means for attaching a cord or ribbon or other securing device whereby the same is supported, substantially as and for the purpose set forth.

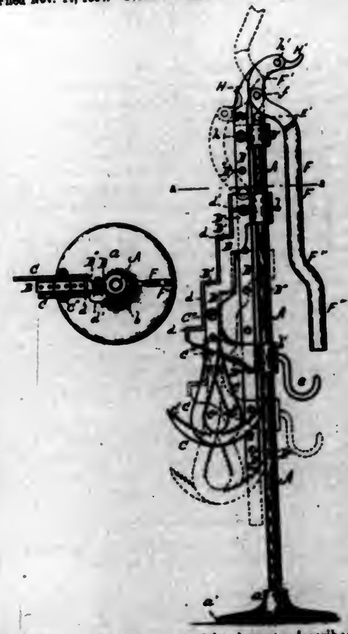
602,054. NUT-WRENCH. HENRY L. BUTLER, Emerson, Nebr. Filed Dec. 11, 1897. Serial No. 661,578. (No model.)

Claim.—1. In a nut-wrench, the combination with a bar carrying a fixed jaw and a movable jaw pivoted thereto, a spindle mounted in a bearing on said bar, a wrench-head carried by said spindle and located at said fixed jaw, and means for rotating said spindle substantially as described.



2. In a nut-wrench, the combination with a clamp comprised of a fixed and a movable jaw, said fixed jaw having a bifurcation, of a spindle, a wrench-head carried by the spindle and located at the bifurcation, a bevel gear-wheel on said spindle, a second bevel gear-wheel meshing with the aforesaid gear-wheel, and a crank-handle connected with the second wheel to operate it, substantially as described.

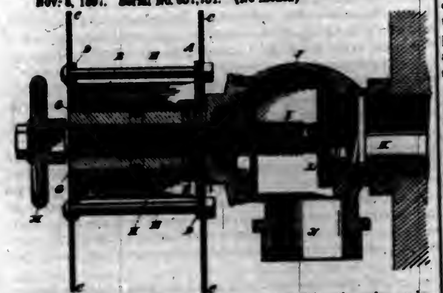
3. In a nut-wrench, the combination of a slotted bar, a movable clamp-jaw pivoted on a bolt adjustable in the bar-slot, a fixed clamp-jaw secured to said bar adjacent to the movable jaw, and having its outer end bifurcated and curved as described, a bracket on said bar, a spindle journaled in said bracket having at its lower end a wrench-head, and having at its upper end a squared portion and a reduced screw-threaded portion, a bevel gear-wheel on the squared portion, a nut on the reduced portion, and a second bevel gear-wheel meshing with the aforesaid gear-wheel and mounted on an operating crank-shaft journaled in the upper end of said bar, substantially as described.



602,055. BED ATTACHMENT. THOMAS H. CAMPBELL, Seattle, Wash. Filed May 20, 1897. Serial No. 637,490. (No model.)

Claim.—1. The holder comprising the fixed section having the central depending angular stud or key, and also having the legs, and the swinging section pivoted as described and arranged in the cut-out portion of the fixed section so as to open and close the same, in combination with the horizontal arm adapted to be supported on a bed-rail and having the vertically-disposed keyhole-slot with the inclined plane on the under side, and the annular flange on its upper side, substantially as specified.

2. The upright, having its lower end bifurcated, and one of its branches screw-tapped to receive a thumb-screw for fastening the same to a bed-rail, in combination with the horizontal arm arranged on the upright and adjustably supported by means of a collar, said arm having a handle at one end, and its opposite end having an annular flange on its upper side and a vertically-disposed keyhole-slot, and a holder having a depending key or angular stud to take into said slot and secure the holder upon the arm, substantially as specified.



602,056. LIFTING-JACK. FRANK W. CHICKERING, Cabot, Vt. Filed Nov. 17, 1897. Serial No. 658,787. (No model.)

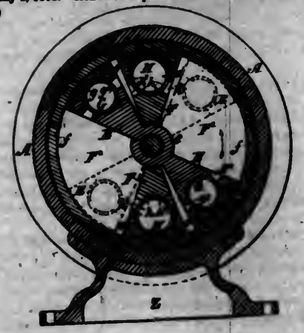
Claim.—1. In a lifting-jack of the character described, the standard A; the lifting-frame B provided with the arms B″ B‴ slidable on the standard; the hooks C pivotally secured at their upper ends to opposite sides of the lifting-frame and arranged with their hooked portions extending toward each other, such portions being provided with the inner serrated edges C′; the lifting-bar D extending through said arms B″, B‴ and adjustably connected thereby as to height with the lifting-frame and slidable on the standard; an extension or coupling driven into the upper end of the standard; the lifting-lever F provided with the curved portion F′ pivotally connected with the upper end of said coupling or extension; and the curved link H pivotally connected at its opposite ends with the upper end of the lifting-bar and the upper end of the lifting-lever, substantially as set forth.

2. A lifting-jack of the character described, comprising the standard A; the base *a* made bell-shaped and with its lower edge provided with the serrations *a′*; the lifting-frame B provided with the hook *c*, said lifting-frame slidable on the standard; the lifting-bar D adjustably secured to the lifting-frame and extending through suitable arms connecting the same with the standard, said lifting-bar slidable on said standard; the coupling or extension projecting upward from the upper end of the standard; the lifting-lever F pivotally secured to upper end of said coupling or extension, and the curved link H pivotally secured at its opposite ends to the upper ends of the lifting-bar and lifting-lever and provided at its upper end with the hook H′, substantially as described.

602,057. HOSE-REEL. EDWARD CLIFF, Newark, N. J. Filed Nov. 8, 1897. Serial No. 657,751. (No model.)

Claim.—1. The water-supply apparatus having the valve-casing, valve, exposed hose-attaching nozzle, sleeve and valve-stem, the latter passing through said sleeve, combined with the reel mounted to revolve upon said sleeve, the hose secured to said exposed nozzle and thence wound upon said reel, and the handle upon the said stem; substantially as set forth.

2. The water-supply apparatus having the valve-casing, valve, exposed hose-attaching nozzle, sleeve, and valve-stem, the latter passing through said sleeve, combined with the reel mounted to revolve upon said sleeve, the key retaining the reel upon said sleeve, the frictional device applied to said reel to prevent the too free revolution of the same, the hose secured to said exposed nozzle and thence wound upon said reel, and the handle upon said stem; substantially as set forth.



3. The water-supply apparatus having the valve-casing, the valve, the threaded valve-stem, the sleeve connected with said casing and internally threaded to engage said valve-stem, and the exposed hose-attaching nozzle, combined with the reel mounted to revolve upon said sleeve, the hose attached to said nozzle, and thence wound upon said reel, and the handle upon said stem; substantially as set forth.

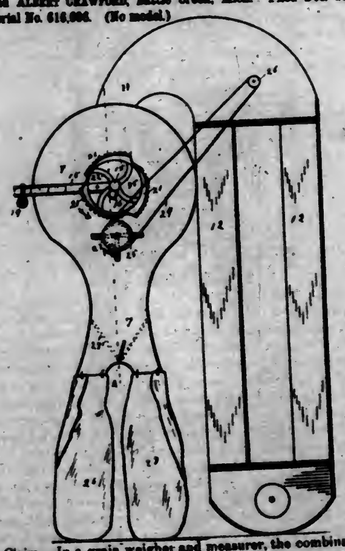
602,058. POLISHING-BRUSH. GEORGE F. COOPER, Xenia, Ohio. Filed Oct. 12, 1897. Serial No. 654,821. (No model.)

Claim.—A polishing-brush consisting of a metal back having downwardly-extending flanges or rims, the lower edges of which are cut away at intervals and inwardly inclined forming a contracted opening, a plurality of longitudinal strips of cloth, felt, chamois or similar material, said strips being secured in the back by means of the said inclined flanges, substantially as described.

602,059. ENGINE. DANIEL LE ROY DRESSER, Flushing, N. Y. Filed May 1, 1893. Renewed Sept. 20, 1897. Serial No. 652,269. (No model.)

Claim.—1. In a rotary engine, the combination with an outer cylinder, or casing, and a central shaft, of two pistons or sets of pistons, so arranged that each piston or set of pistons shall make a partial revolution or circumferential movement at each admission of steam and impart its motion to the shaft while the other piston, or set of pistons, is held from movement, and valves for controlling said pistons, the said valves being carried by the pistons, substantially as set forth.

2. In a rotary engine, the combination with an outer cylinder or casing, and a central shaft, of two pistons or sets of pistons adapted to move alternately, valves in connection with each piston or set of pistons, and means whereby the valves in one piston or set of pistons are operated by the movement of the other piston or set of pistons, substantially as set forth.



3. In a rotary engine, the combination with an outer cylinder or casing, and a central shaft, of two pistons or sets of pistons adapted to move alternately in the same circumferential path, inlet-valves in connection with one piston or set of pistons, and outlet or exhaust valves in connection with the other piston or set of pistons, and means for automatically operating said valves, substantially as set forth.

4. In a rotary engine, the combination with an outer cylinder or casing having a steam-inlet and a steam-outlet, and a central shaft, of two disks carried by the shaft, pistons projecting from both of said disks toward each other and dividing an intervening annular space, valves automatically operated by the movement of said pistons, and two collars fixed upon the central shaft, one adjacent to each of said disks, and adapted to receive rotary motion therefrom, substantially as set forth.

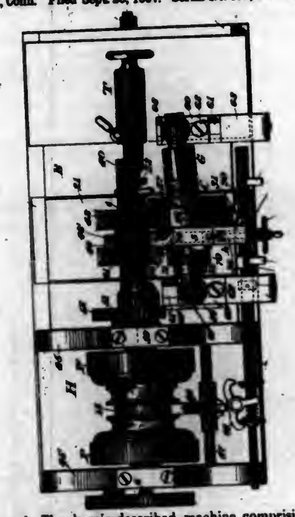
5. In a rotary engine, the combination with an outer cylinder or casing having a steam-inlet and a steam-outlet, and a central shaft, of two disks carried by the shaft, pistons projecting from both of said disks toward each other, valves automatically operated by the movement of said pistons, two collars fixed upon the central shaft one adjacent to each of said disks, and means in connection with the casing, the disks and the collars, whereby motion is imparted to the shaft through each of the collars alternately, and the disks and pistons are held alternately from backward or reverse movement, substantially as set forth.

6. In a rotary engine, the combination with an outer cylinder or casing, and a central shaft, of a disk carrying pistons and valves and having a cylinder or sleeve loosely surrounding said shaft, a disk also carrying pistons and valves and mounted loosely upon said cylinder or sleeve near its end and having an annular flange or rim extending to or beyond said first-named disk, said sleeve and said flange circumscribing the space in which the pistons rotate, and having devices, as tappets, for operating the valves, substantially as specified.

602,060. GRAIN WEIGHER AND MEASURE. JOHN W. DUTTON and ALBERT CRAWFORD, Battle Creek, Mich. Filed Dec. 23, 1896. Serial No. 616,996. (No model.)

Claim.—In a grain weigher and measurer, the combination of a hopper having the elongated slots, a revoluble wheel having grain-

compartments and an axle with ends in said slots, a wheel or disk attached to one end of the axle and having a series of eccentric peripheral portions, each of said portions having gear-teeth at outer edge, a weight-bar, and a pinion to which motion is imparted and adapted to mesh with the gear-teeth of the eccentrics, to guard against clogging, substantially as set forth.



602,061. STAMP-PAD. WILLIAM A. ECHELBERGER, Hot Springs, Ark. Filed Dec. 7, 1896. Serial No. 614,758. (No model.)

Claim.—1. An inking-pad for hand or other stamps, consisting of a block of wood or other suitable material provided with slits dividing it up into different sections, sheets of fabric covering each of said sections fitted down within said slits and glued or otherwise secured along its outer edges to the edges of said slits, and absorbent material interposed between the upper surface of said sections and said sheets of fabric, substantially as and for the purpose described.

2. An inking-pad for hand or other stamps consisting of a pan of sheet metal, a block of wood or other suitable material fitting within said pan and provided with slits dividing said block up into different sections, sheets of fabric covering each of said sections fitted down within said slits and glued or otherwise secured along its outer edges, and absorbent material interposed between the upper surface of said sections and said sheets of fabric, substantially as and for the purpose described.

602,062. METAL-WORKING MACHINE. FRANK G. ECHOLS, Hartford, Conn. Filed Sept. 20, 1897. Serial No. 652,226. (No model.)

Claim.—1. The herein-described machine comprising a work-holder; a tool-holder; automatically-operative mechanism for rotating one of said holders; an intermittently-effective cutting-tool carried by the tool-holder; and means for automatically oscillating one of said holders toward and from the other a plurality of times during each rotation of the rotary holder and for maintaining a fixed interval between the holders while they are in their working positions, the parts being combined substantially as and for the purpose specified.

2. The herein-described machine comprising a work-holder; a tool-holder; automatically-operative mechanism for rotating one of said holders; means for imparting a feed movement to one of said holders; an intermittently-effective cutting-tool carried by the tool-holder; and means for automatically oscillating one of said holders toward and from the other a plurality of times during each rotation of the rotary-holder and for maintaining a fixed interval between the holders while they are in their working positions, the parts being combined substantially as and for the purpose specified.

3. The herein-described machine comprising a tool-holder; a tap-holder; automatically-operative mechanism for continuously rotating the tap-holder; an intermittently-effective cutting-tool carried by the tool-holder; and means for automatically oscillating the tool-holder to carry said tool into engagement with alternate wings of the tap and maintaining it at a fixed distance from the axis of the tap while in its working position and for withdrawing said tool from engagement with intermediate wings of said tap, the parts being combined substantially as and for the purpose specified.

4. The combination, with a work-holder and with a tool-holder, of means for rotating one of said holders; means for imparting a feed movement to the tool-holder; an intermittently-effective cutting-tool carried by the tool-holder; a tool-holder guide disposed at an angle to the longitudinal axis of the work-holder, and means for automatically shifting one of said holders toward and from the other a plurality of times during each rotation of the rotary holder.

5. The combination, with a work-holder and with a tool-holder, of means for rotating one of said holders; means for imparting a feed movement to the tool-holder; an intermittently-effective cutting-tool carried by the tool-holder; a tool-holder guide adjustable at an angle to the longitudinal axis of the work-holder; and means for automatically shifting one of said holders toward and from the other a plurality of times during each rotation of the rotary holder and for maintaining a fixed interval between the holders while they are in their working positions.

6. The combination, with a tool-holder guide, of a work-holder; a tool-holder carried by said guide for oscillation toward and from the work-holder; work-holder-rotating means; means for imparting a feed movement to the tool-holder; a cutting-tool carried by the tool-holder; and automatic rotary tool-holder-oscillating means.

7. The combination, with a tool-holder guide, of a work-holder; a tool-holder carried by said guide for oscillation toward and from the work holder; work-holder-rotating means; means for imparting a feed movement to the tool-holder; a tool-slide carried by, and movable transversely of, the tool-holder; a cutting-tool carried by the tool-slide; and automatic rotary tool-holder-oscillating means.

8. The combination, with a tool-holder guide, of a work-holder; an oscillatory tool-holder embodying a sleeve mounted to slide on said guide and pivoted to the main portion of the tool-holder; work-holder-rotating means; means for imparting a feed movement to the tool-holder; a cutting-tool carried by the tool-holder; and automatic tool-holder-oscillating means.

9. The combination, with a work-holder, of automatically-operative work-holder-rotating means; a tool-carriage; mechanism for imparting a feed movement to the tool-carriage; a tool-holder supported on the tool-carriage for oscillation transversely to the longitudinal axis of the work-holder; a cutting-tool carried by the tool-holder; and means for automatically oscillating said tool-holder toward and from the work-holder a plurality of times during each rotation of the work-holder and for maintaining the tool at a fixed distance from the axis of the work-holder while in its working position.

10. The combination, with a work-holder, of work-holder-rotating means; a guide adapted to be set at an angle to the longitudinal axis of the work-holder; a tool-carriage; mechanism for imparting a feed movement to the tool-carriage; a tool-holder carried by the tool-carriage; a tool-slide supported on the tool-holder to slide transversely thereof and guided by said guide; a cutting-tool carried by the tool-slide; and means for shifting said tool-holder toward and from the work-holder.

11. The combination, with a work-holder, of work-holder-rotating means; a guide adapted to be set at an angle to the longitudinal axis of the work-holder; a tool-carriage; mechanism for imparting a feed movement to the tool-carriage; a tool-holder carried by the tool-carriage; a tool-slide supported on the tool-holder to slide transversely thereof; a sleeve slidable on said guide and movably connected with the tool-slide; a cutting-tool carried by the tool-slide; and means for shifting said tool-holder toward and from the work-holder.

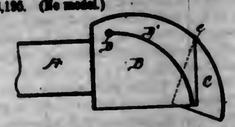
12. The combination, with a work-holder and means for rotating the same, of a guide adapted to be set at an angle to the longitudinal axis of the work-holder; a tool-carriage; mechanism for imparting a feed movement to the tool-carriage; a tool-holder supported on the tool-carriage for oscillation transversely to the longitudinal axis of the work-holder; a tool-slide supported on the work-holder to slide transversely thereof and guided by said guide; a cutting-tool carried by the tool-slide; and means for oscillating said tool-holder toward and from the work-holder

13. The combination, with a work-holder and with a tool-holder, of work-holder-rotating means; means for imparting a feed movement to the tool holder; an intermittently-effective cutting-tool carried by the tool-holder; means for automatically shifting said tool-holder toward and from the work-holder a plurality of times during each rotation of the work-holder; and throw-out mechanism for automatically shifting the tool-holder out of action at a predetermined point in the operation of the machine.

14. The combination, with a work-holder and with a tool-holder, of work-holder-rotating means; mechanism for imparting a feed movement to the tool-holder; an intermittently-effective cutting-tool carried by the tool-holder; means for automatically shifting said tool-holder toward and from the work-holder a plurality of times during each rotation of the work-holder; and for maintaining the tool at a fixed distance from the axis of the work-holder while in its working position and means controlled by the feed movements of the tool-holder for automatically reversing the operation of the feed mechanism.

15. The combination, with a work-holder and with a tool-holder, of work-holder-rotating means; mechanism for imparting a feed movement to the tool-holder; an intermittently-effective cutting-tool carried by the tool-holder; means for automatically shifting said tool-holder toward and from the work-holder a plurality of times during each rotation of the work-holder; and for maintaining the tool at a fixed distance from the axis of the work-holder while in its working position and means controlled by the feed movements of the tool-holder for automatically reversing the operation of the feed mechanism at opposite ends of the range of travel of the tool-holder.

16. The combination, with a work-holder and with a tool-holder, of work-holder-rotating means; mechanism for imparting a feed movement to the tool-holder; an intermittently-effective cutting-tool carried by the tool-holder; means for automatically shifting said tool-holder toward and from the work-holder a plurality of times during each rotation of the work-holder; means for automatically reversing the operation of the feed mechanism; and mechanism for automatically throwing the tool-holder into and out of action alternately at the beginning and at the end of its range of travel.

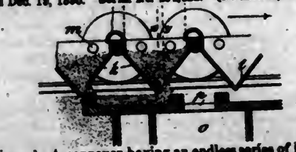


17. The combination, with a work-holder and with an oscillatory tool-holder, of means for continuously rotating the work-holder; an intermittently-effective cutting-tool carried by the tool-holder; and a rotary shaft carrying a plurality of wipers cooperative with the tool-holder for intermittently oscillating the latter away from the work-holder during the rotation of said work-holder and for maintaining the tool at a fixed distance from the axis of the work-holder while in its working position.

18. The combination, with an oscillatory tool-holder and with a work-holder, of means for continuously rotating the work-holder; an intermittently-effective cutting-tool carried by the tool-holder; and a rotary shaft carrying a plurality of equidistant wipers cooperative with the tool-holder for intermittently oscillating the latter away from the work-holder during the rotation of said work-holder and for maintaining the tool at a fixed distance from the axis of the work-holder while in its working position.

19. The combination, with a tool-holder and with a tap-holder adapted to carry a tap having equidistant wings, of means for continuously rotating the tap-holder; an intermittently-effective cutting-tool carried by the tool-holder; a rotary shaft carrying a plurality of equidistant wipers, one for each wing of the tap, and cooperative with the tool holder for intermittently shifting the latter away from the work-holder during the rotation of said work-holder; and a two-to-one gear-train between the work-holder and said shaft.

20. The combination, with a work-holder and with a tool-holder, of work-holder-rotating means; means for imparting a feed movement to the tool-holder; an intermittently-effective cutting-tool carried by the tool-holder; a tool-holder guide adjustable at an angle to the longitudinal axis of the work-holder; a taper-indicating device for determining the angular position of said guide; and means for shifting the tool-holder toward and from the work-holder and for maintaining the tool at a fixed distance from the axis of the work-holder while in its working position.



602,063. STACKER. PERRY W. HAZZARD, Lafayette, Ill., assignor of one-half to Frank R. Cole, Peoria, Ill. Filed Sept. 27, 1897. Serial No. 653,136. (No model.)

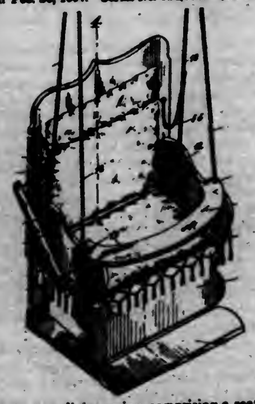
Claim.—1. In a wind-stacker, provided with a suitable chute, a hood arranged at its outer end, having suitable fingers carried therein acting as a stop for the straw, a suitable deflector for the chaff hinged to the hood and suitable mechanism for actuating the said fingers and deflector as the chute is raised or lowered, all substantially as and for the purpose described.

2. In a wind stacker, the combination with the hood B, suitably secured to the chute of the stacker, of suitable fingers D', the rod D, at the inner and forward end of the hood B; the deflector C, hinged at *c* to the hood and rods *d* and *e* and suitable mechanism for actuating the said rods causing a raising and lowering of the said fingers and deflector when the chute is up or down, all substantially as and for the purpose described.

602,064. CONVEYER. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Dec. 18, 1893. Serial No. 494,122. (No model.)

Claim.—1. A conveyer having an endless series of buckets, each having an opening in the bottom and one wall of each bucket forming a scraper, whereby the scraping action of the buckets serves to control automatically the discharge of material therefrom, substantially as set forth.

2. A scraping-conveyer having each one of its scrapers or flights in the form of a bucket with an opening in the lower part of the forward side of such bucket, whereby the scraping action of such bucket serves to control automatically the discharge of material from the buckets, substantially as set forth.



3. In a conveyer, the combination of an endless chain of moving buckets having openings in their bottoms, means for delivering material to said buckets, and means for effecting a distribution of such material, consisting of a platform over which said buckets move from the place of receiving to the place of delivery of such material, and a series of receptacles having openings in said platform directly under the line of movement of said buckets, substantially as set forth.

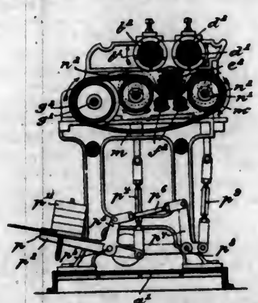
4. The combination of an endless chain of buckets having openings in their bottoms, means for delivering material to said buckets, a series of open receptacles situated beneath said buckets and a platform above the upper ends of said receptacles, and over which the material is moved by the scraping action of said buckets, substantially as set forth.

5. The combination of an endless chain of buckets having openings in their bottoms; said openings facing the direction in which the buckets are moved, means for delivering material to said buckets, a series of open receptacles situated beneath said buckets, and a platform above the upper ends of said receptacles, and over which the material is moved by the scraping action of said buckets, substantially as set forth.

6. The combination of an endless chain of buckets having openings in their bottoms, means for delivering material to said buckets, a series of open receptacles situated beneath said buckets, a platform above the upper ends of said receptacles, having openings therein into said receptacles and over which the material is moved by the scraping action of said buckets, and vertical sides for said platform between which the said buckets operate, substantially as set forth.

602,065. RECLINING-SWING. WILLIAM H. ELLIOTT, Bradner, Mo. Filed Feb. 20, 1897. Serial No. 624,236. (No model.)

Claim.—1. A reclining-swing comprising a seat, back and foot-rest suitably hinged together, arms pivoted at one end to the seat, a



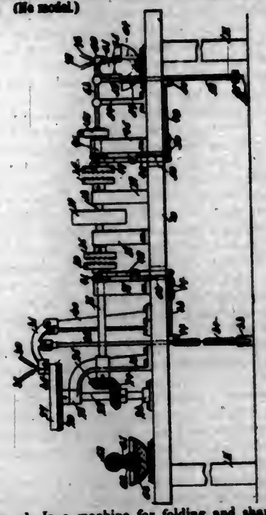
rod carried by the back, rack-bars also carried by the back which are adapted to be engaged by the rod for holding the parts in the desired position, means for holding the rod normally in engagement with the racks, and suspending devices for supporting the swing, substantially as described.

2. A reclining-swing comprising a seat, back and foot-rest suitably hinged together, guideways secured upon the back, racks formed within the guideways, arms pivoted at one end to opposite sides of the seat, a rod journaled between the opposite ends of the arms and adapted to move within the guideways, cranks formed upon said rod and adapted to engage the racks, springs adapted to hold the cranks normally in engagement with the racks and against the tension of which the crank-rod is disengaged therefrom, means for operating said rod, and suspending devices for the swing, substantially as described.

3. A reclining-swing comprising a seat, back and foot rest suitably hinged together, guideways formed upon the back, racks formed in said guideways, arms pivoted at one end to opposite sides of the seat, a rod connecting the opposite ends of the arms, said rod adapted to extend through the guideways, cranks formed on said rod and adapted to engage the teeth of the racks, means for holding the cranks normally in engagement with the racks, a crank formed on said rod intermediate its ends, an operating-rod secured at one end to said crank and at its opposite end extending within convenient reach for operating the crank-rod to secure the proper adjustment of the swing, and means for suspending the swing, substantially as described.

4. A reclining-swing comprising a seat, back and foot-rest suitably hinged together, suspending ropes connected at their lower ends to the seat, side pieces carried by the rope and independent of the seat, flexible connections between the ropes and the back, arms hinged at one end to the foot-rest, arms secured to the back of the swing and at their opposite ends pivoted to the first-named arms, guideways formed in the upper ends of the arms which are secured to the back, racks arranged within said guideways, a crank-rod carried by the back and extending within the guideways for the purpose of engaging the racks, and means for holding the rods normally in engagement with the racks, substantially as described.

602,066. HIDE, SKIN, OR LEATHER MACHINERY. WILLIAM EVANS, Philadelphia, Pa. Filed Aug. 9, 1897. Serial No. 647,325. (No model.)



Claim.—1. In a machine of the character described, two or more finishing-rolls having fixed bearings, an endless traveler-apron upon which the hide, skin or leather is supported and normally at rest, a friction-roll for driving said apron and means for simultaneously bringing said apron into close contact with respect to said friction-roller and operative position with respect to said finishing-rolls, whereby said apron is set in motion and the hide, skin or leather at one operation acted upon from end to end successively by each finishing-roll, substantially as and for the purposes described.

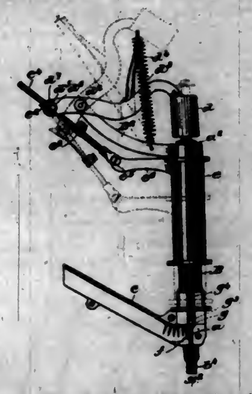
2. In a machine of the character described, two finishing-rolls, an endless apron supporting the work, a gripping-roller located below and between the finishing-rolls, two feed-rolls between which and the grip-roller the apron is adapted to travel, two rollers each arranged on either side of the grip-roller below the apron said grip-roller adapted to actuate said apron when said rollers are raised and means for raising said rollers to bring successive portions of the apron into operative position with respect to the rolls, substantially as and for the purposes described.

3. In a machine of the character described, an endless apron, a grip-roller and feed-rollers between which the apron is adapted to be frictionally operated, a stationary drum around which the apron travels, two vertically-movable rollers upon which the apron is supported arranged respectively on either side of the gripping and feed-rollers, said grip-roller adapted to actuate the apron when said rollers are raised, and a treadle mechanism for simultaneously raising and lowering the supporting-rollers, substantially as and for the purposes described.

4. In a machine of the character described, a plurality of finishing-rolls, the bearings whereof are fixed to prevent vertical movement of the rolls, a traveler-apron located below and normally out of operative position with respect to all the rolls, a plurality of presser-rollers or their equivalents arranged beneath the apron, and each located under corresponding finishing-rolls, and means for successively raising the presser-rollers to present portions of the traveler-apron in operative position with respect to each succeeding finishing-roll, whereby the work may be operated upon from end to end successively by the finishing-rolls at one operation, substantially as and for the purposes described.

602,067. MACHINE FOR FOLDING AND SHAPING COLLARS. ANTONINO FARINA, New York, N. Y. Filed Feb. 17, 1896. Serial No. 579,549. (No model.)

Claim.—1. In a machine for folding and shaping collars, the combination with a drive-shaft, of a flanged disk, a shaft carrying said disk, a driving mechanism for said shaft, a movable block grooved to receive the flange of the disk, and means for simultaneously moving the block into and out of engagement with the flange of the disk and throwing the driving mechanism of the disk-carrying shaft into and out of gear with the drive shaft, substantially as described.



2. In a machine for folding and shaping collars, the combination with a drive-shaft, of a flanged disk, a shaft carrying said disk, a driving mechanism for the shaft, a clutch mechanism between the said shaft and the drive-shaft, a pivoted block grooved to receive the flange of the disk, and means for simultaneously raising and lowering the block and operating the clutch to throw the driving mechanism of the disk-carrying shaft into and out of engagement with the drive-shaft, substantially as described.

3. The combination with a frame, of a shaft capable of being continuously driven, a second shaft, a clutch capable of connecting the two shafts, a disk having a flange, the disk being driven from the second shaft, a pivotally-mounted lever, a block carried by the lever and capable of engaging the flange of the disk, mechanism for moving the lever, and a connection between said mechanism and the clutch, the connection being capable of engaging the members of the clutch simultaneously with the downward movement of the lever, substantially as described.

4. In a machine for folding and shaping collars, the combination with a drive-shaft, of a flanged disk, a shaft carrying said disk, a driving mechanism for the shaft, a clutch connecting said mechanism with the drive-shaft, a pivoted block grooved to receive the flange of the disk, a treadle connected with the pivoted block, and means for operating the clutch from the treadle, substantially as described.

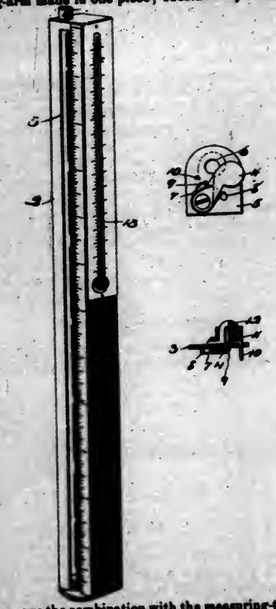
602,068. HARD TACK-DRIVER. JAMES H. FERGUSON, Boston, Mass., assignor to George Ferguson, same place. Filed Mar. 30, 1897. Serial No. 630,691. (No model.)

Claim.—1. In a hand tack-driver, the combination with a driver-rod adapted to cooperate with a tack to be driven, of a pivotally-supported hammer for said rod, and an actuating device adapted by a continuous movement in one direction to automatically set and release said hammer to drive the tack, substantially as described.

2. In a hand tack-driver, the combination with the driver-rod, of a guideway for said driver-rod formed in a suitable frame or casing, the end of the said driver-rod projecting beyond the said casing, an external hammer connected with said casing and adapted to strike the end of the said rod to drive the tack, and an actuating device adapted by a continuous movement in one direction to set and release said hammer, substantially as described.

3. In a hand tack-driver, the combination with the guideway, adapted to receive tacks one by one, of a driver-rod longitudinally movable in said guideway, a sleeve surrounding said guideway and longitudinally movable with relation thereto, a hammer pivotally supported above said guideway and adapted to strike the said driver-rod, a latch connected with said sleeve and adapted during the movement thereof in one direction to engage the said hammer whereby a movement thereof in the opposite direction will carry the hammer to its operative position, and means for automatically disengaging said latch to permit the hammer to operate, substantially as described.

4. In a tack-driver, the combination with the driver-rod, of a guideway for said driver-rod, a raceway or feed-chute for the tacks extending toward said guideway, a gate normally extending transversely across said raceway and yieldingly held in each position as by a spring, and a projection directly connected with said gate and extending into said guideway beyond the said chute in the path of said driver-rod whereby the said gate is opened by the cooperation of said driver-rod with said projection after the end of the said driver-rod has passed the said chute in its operative movement, and is closed by the action of its spring before the end of the driver-rod has reached the chute in the inoperative movement of said rod, substantially as described.

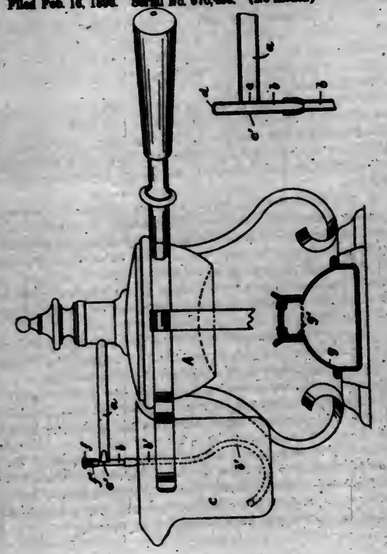


5. In a tack-driver, the combination with the guideway *b*, of the driver-rod *a* longitudinally movable therein, the feed-chute *c* opening into said guideway, the gate *f* mounted on the pivoted bar f^2 and extending transversely across said feed-chute, and the projection f^3 from said bar extending into said guideway below the said feed-chute and adapted to be engaged and operated by the driver-rod, substantially as described.

6. In a tack-driver, the combination with the driver-rod and guideway therefor, of a feed-chute or raceway communicating with said guideway, a gate for controlling the tacks in said raceway, an actuating-cam for said gate extending into said guideway below the said raceway and adapted to be operated upon by the driver to open the gate, a "kicker-in" for positioning a tack in said guideway, and a cam projection from said "kicker-in" extending into the said guideway above the said chute, said cam projection being adapted to be operated upon by the driver to move the said "kicker-in" out of the way during the descent of said driver, substantially as described.

602,069. GAGE FOR LIQUID IN VESSELS. ROY S. FOLTZ and CHARLES A. PHILLIPS, New Castle, Pa. Filed Apr. 24, 1897. Serial No. 633,698. (No model.)

Claim.—1. In a gage the combination with the tube and its inclosing casing, the spring-pressed valve for closing said tube, the pin for holding the valve retracted, and the trigger or arm for releasing the valve; substantially as described.

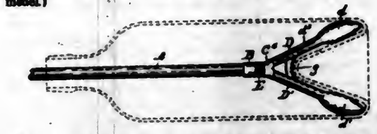


2. In a gage the combination with the tube and its inclosing casing, the spring-operated valve for closing the tube, the holding-pin and releasing-arm made in one piece; substantially as described.

3. In a gage the combination with the measuring-tube and its inclosing casing, the spring-operated valve for closing the tube, the valve-holding pin and releasing-arm formed in one piece and the spring holding said pin and arm projected; substantially as described.

4. In a gage the combination with the measuring-tube and its inclosing casing, of the spring-operated valve, the valve-holding pin and releasing-arm formed of one piece of wire bent to substantially U shape, with one branch shorter than the other, the shorter branch constituting the holding pin and the longer the releasing-arm; substantially as described.

602,070. ATOMIZER. WALTER S. FIELD, London, England. Filed Feb. 16, 1898. Serial No. 670,466. (No model.)



Claim.—1. A spraying device comprising the receptacle for the liquid to be sprayed, the suction-pipe depending therein and having oppositely-located openings near its upper end, the supply-pipe for the fluid under pressure communicating with one of said openings, and means for admitting a varying quantity of air to the suction-pipe above the said openings for regulating the supply of liquid to be sprayed, substantially as described.

2. In spray-producing apparatus, a regulating device consisting of a cap provided with a hole and rotatable upon a suction-pipe also furnished with a hole, these holes being capable of coinciding, the suction-pipe being secured across a jet pipe or spout and said suction-pipe communicating with the liquid to be vaporized and being furnished with two diametrically opposite holes allowing the vaporizing steam or gas to pass from said jet-pipe across the suction-pipe and to escape from the outer larger hole, the amount of liquid sprayed by said jet of gas being variable or reducible by admitting air into the suction-pipe through the regulating-cap, substantially as described.

3. In spray-producing apparatus and the like, the combination with the jet-pipe of the apparatus, of a suction-pipe secured thereto and having holes *d e e'*, and a regulating-cap *f* rotatable upon said suction-pipe and having a hole *f'*, substantially as and for the purposes described.

602,071. BOTTLE-WASHER. GEORGE P. GOULDING, Charlotte, Monroe County, N. Y. Filed Dec. 22, 1896. Serial No. 616,641. (No model.)

Claim.—1. In a bottle-washing device, a hollow base-piece adapted for connection with a water-supply device, tubes extending therefrom whereby water is conducted from said base-piece and delivered at the extremities of said tubes, said tubes being adapted to fold together for insertion through the neck of a bottle, and a flexible web or band connecting said tubes.

2. In a bottle-washing device, a hollow base-piece adapted for connection with a water-supply device, flexible tubes extending from said base-piece whereby water may be conducted from said base-piece and delivered at the extremities of said tubes, stiffening means for each of said flexible tubes, and a flexible web or band connecting said flexible tubes.

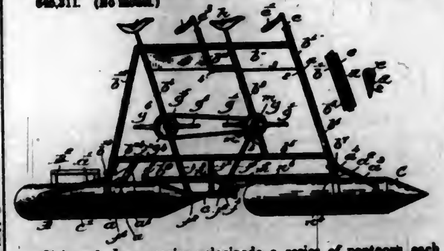
3. In a bottle-washing device, a hollow base-piece adapted for connection with a revoluble water-supply device, and angularly-separable stiffened tubes connected to said base-piece whereby water may be conducted therefrom and delivered at the extremities of said tubes, said tubes being adapted to fold together for insertion through the neck of a bottle, each tube having a flexible end, and a flexible web or band connecting said tubes.

4. In a bottle-washing device, a ferrule adapted for connection with a revoluble water-supply device, a pair of rigid tubular arms pivoted to said ferrule and having their ends within the same, and a flexible tube of soft material around each arm and perforated at the end for emergence of water.

5. In a bottle-washing device, a ferrule adapted for connection with a revoluble water-supply device, a pair of rigid tubular arms pivoted to and within said ferrule and extending therefrom, and a flexible tube on each rigid arm having a bulbous end of soft material, and a perforation at the extremity of said end for delivery of water therefrom.

6. In a bottle-washing device, a ferrule adapted for connection with a revoluble water-supply device, a pair of rigid tubular arms pivoted to and within said ferrule and extending therefrom and adapted to be folded together and to move to an angular position with reference to each other, and a flexible tube of fabric on each rigid arm having a fringed, fibrous edge and a bulbous end, and a perforation at the extremity of said bulbous end for the delivery of water therefrom.

7. In a bottle-washing device, a ferrule B adapted for connection with a revoluble water-supply device, having a central plate C^2 therein, a pair of rigid, open tubular arms C C having one end of each within said ferrule and on each side of said plate, a pivoting-pin C^3 passing transversely through said ferrule, plate and arms, and a flexible tube of soft material on each arm provided with a perforation.



8. In a bottle-washing device, a ferrule B adapted for connection with a revoluble water-supply device, having a central plate C^2 therein, a pair of rigid, open tubular arms C C having one end of each within said ferrule and on each side of said plate, a pivoting-pin C^3 passing transversely through said ferrule, plate and arms, and a flexible tube D D' having a perforated bulbous end *d d'* on each arm.

9. In a bottle-washing device, a ferrule B adapted for connection with a revoluble water-supply device, having a central plate C^2 therein, a pair of rigid, open tubular arms C C having one end of each within said ferrule and on each side of said plate, a pivoting-pin C^3 passing transversely through said ferrule, plate and arms, a flexible tube D D' having a perforated bulbous end *d d'* on each arm, and a web or band extending from one tube to the other.

10. In a bottle-washing device, a hollow base-piece adapted for connection with a revoluble water-supply device, a pair of flexible tubes and a tubular stiffening-arm within each flexible tube, whereby water is conducted from said base-piece and delivered at the extremity of said flexible tube, and a flexible reinforcing-layer between the extremity of each arm and its flexible tube.

11. In a bottle-washing device, a hollow base-piece adapted for connection with a water-supply device and tubes extending therefrom whereby water is conducted from said base-piece and delivered at the extremities of said tubes, said tubes having flexible ends and being adapted to fold together for insertion through the neck of a bottle.

602,072. MARINE VELOCIPEDE. JAMES F. GRADY, Boston, and MICHAEL HART, Cambridge, Mass. Filed July 21, 1897. Serial No. 645,311. (No model.)

Claim.—1. In a marine velocipede a series of pontoons, each having a yoke, combined with a velocipede-frame detachably mounted on said yokes, a seat on said frame, a crank-shaft having a bevel-gear, a propeller-shaft mounted in bearings carried by said frame and provided with a bevel-gear, an intermediate shaft *f*, having two bevel-gears and interposed between the crank-shaft and the said propeller-shaft to rotate the same, a steering-shaft connected with the leading pontoon and a handle-bar located in front of the seat ready to be grasped by the hands, to operate substantially as described.

2. In a marine velocipede, a frame supported at its rear end upon two cigar-shaped pontoons to which the rear end of said frame is fixed, a third cigar-shaped pontoon located in front of the two rear pontoons and having a collar upon which the front end of said frame is loosely mounted to turn, a steering-shaft extended through the front tube of said frame and fixed to the yoke of the front pontoon, steering-handles connected with said steering-shaft, a propeller mounted in bearings of said frame, a crank-shaft, an intermediate shaft and gearing interposed between the gearing on the said crank-shaft, and the said propeller-shaft, to rotate the latter, substantially as and for the purpose set forth.

3. In a marine velocipede, three pontoons, each provided with a collar fixed to it at its upper side, a frame having a saddle-seat, a crank-shaft, bearings for a propeller-shaft, and collars b^9, b^{10}, to rest on the collars fixed to the pontoons, means to hold the said collars together, and a steering-shaft and its handle-bar, the construction being substantially as described, whereby the frame and its propeller may be readily attached and detached with relation to the said pontoons.

4. In a marine velocipede, a series of pontoons, a detachable frame carrying the crank-shaft, steering-shaft and propeller, and a series of links to connect the leading pontoon with the rearmost pontoons, whereby the leading pontoon may be readily braced from the rearmost pontoons, and the leading pontoon may when desired be capable of being slid back into position between the rear pontoons when the frame is removed, substantially as described.

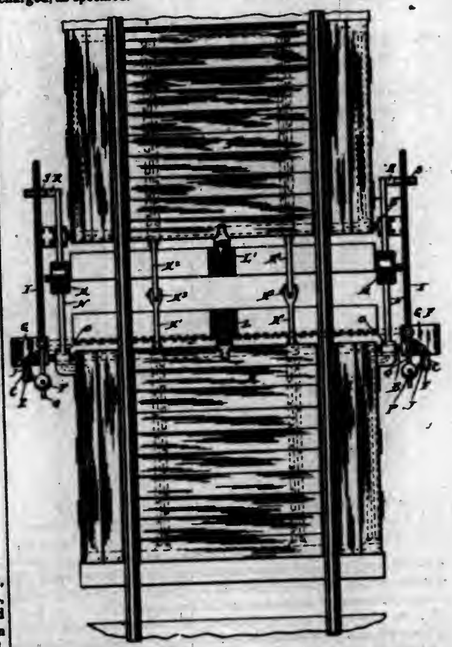
602,073. GARMENT-SUPPORTER. ALVA S. GRIER, St. Mary's, W. Va. Filed June 5, 1897. Serial No. 639,513. (No model.)

Claim.—A garment-supporter consisting of a belt formed of detachable sections, supports secured to the front of the belt and detachably connected together and provided with extra buttonholes for securing the supports to the buttons upon the inner side of the garment, detachable hangers upon the opposite sides of the belt having flexible tongues at their upper ends with buttonholes, and additional buttonholes in the hangers for securing them to the buttons upon the inner side of the garment, said belt and hangers adapted for horizontal and vertical adjustment, substantially as and for the purpose set forth.

602,074. WATER-SPRAYING APPARATUS. HERMANN GOETTOW, Vienna, Austria-Hungary. Filed June 15, 1897. Serial No. 640,810. (No model.) Patented in Germany June 11, 1896, No. 91,909; in England June 13, 1896, No. 11,834; in Hungary June 16, 1896, No. 4,314; in Italy June 21, 1896, No. 30,169/472, and in Austria Sept. 13, 1896, No. 45/3,316.

Claim.—1. In a spraying device, the combination with a casing, of a valve-seat movably interposed between the inlet and the outlet, means for yieldingly resisting its movement, a movable valve adapted to coact with the valve-seat and to become separated therefrom upon movement of said seat, and a distributer for spreading the liquid, substantially as specified.

2. In a spraying device, the combination with a casing, of a valve-seat movably interposed between the inlet and the outlet, a spring for yieldingly resisting its movement, a movable valve adapted to coact with the valve-seat and to become separated therefrom upon movement of said seat, a proper stop for arresting the movement of the seat while the same is actuated by said spring, and a distributer for spreading the liquid, substantially as specified.



3. In a spraying device, the combination with a casing, of a valve-seat movably interposed between the inlet and the outlet, means for yieldingly resisting its movement, a movable valve adapted to coact with the valve-seat and to become separated therefrom upon movement of said seat, and a spraying device having a channel through which the water is forced, the walls of said channel comprising a portion of the surface of the valve-body and a surrounding surface, substantially as specified.

4. In a spraying device, the combination with a casing, of a valve-seat movably interposed between the inlet and the outlet, means for yieldingly resisting its movement, a movable valve adapted to coact with the valve-seat, a movable, grooved, hollow cone adapted to become seated in the outlet of the casing, a grooved portion of the movable valve-body being adapted to become seated in the hollow cone, and means for guiding said hollow cone along the valve-body, substantially as specified.

5. In a spraying device for damping air and ventilation purposes, the combination with a casing of a valve comprising a spindle and two cones such as *d* and *e*, the seating of the latter cone *e* being in the lower part of the casing and either the seating or the cone having suitable grooves cut in it, the seating of the former cone *d* being a movable ring such as *e*, a spring tending to raise this ring and a device to limit the upward movement of the movable ring substantially as and for the purpose described and illustrated in the accompanying drawings.

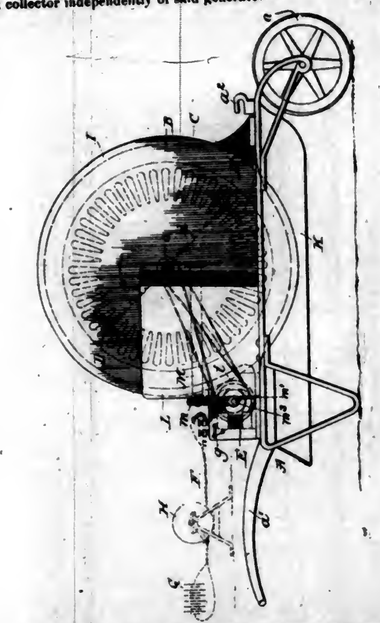
602,075. CATTLE-GUARD. WALTER C. HALLEY, Halley, Ark. Filed June 10, 1897. Serial No. 640,197. (No model.)

Claim.—1. In combination, a post set upon each side of the railway, gates hinged thereto, weights for balancing said gates, two rock-shafts journaled in suitable bearings and extending across the railway-track, arms projecting upward from one of said shafts, levers connected to said arms, short arms projecting from the pintle-posts of the gates, horizontal links connecting the last-named levers and the short arms, and the figure of a dog having firing mechanism therein whereby when the gates are swung closed a cartridge will be discharged, as specified.

2. In combination, a post set upon each side of the railway, gates hinged thereto, weights for balancing said gates, two rock-shafts journaled in suitable bearings and extending across the railway-track, arms projecting upward from one of said shafts, levers connected to said arms, short arms projecting from the pintle-posts of the gates, horizontal links connecting the last-named levers and the short arms, a figure of a dog having firing mechanism therein whereby when the gates are swung closed a cartridge will be discharged, and latch-hooks carried by the weighted arms for holding the gates open so long as the platforms remain in their normal positions, as specified.

3. A cattle-guard consisting of posts mounted on either side of a railway-track, gates hinged thereto, weights for balancing said gates, rock-shafts journaled in suitable bearings and extending across the track, platforms mounted on said rock-shafts, weighted levers connected with said rock-shafts, latches on the weighted levers to engage the gates, and means connected with the rock-shafts to close said gates when the platforms are depressed, substantially as set forth.

602,076. COTTON-PICKING MACHINE. ARTHUR A. HAMERSCHLAG and THEODORE H. PRICE, New York, N. Y. Filed Apr. 12, 1897. Serial No. 631,740. (No model.)



Claim.—1. In a cotton-picking machine, the combination of a supporting-frame, a generator of electricity having movement relatively to said frame, and a cotton-collecting member having movement relatively to the frame independently of the generator, and located in inductive proximity to said generator, so as to be charged by induction therefrom.

2. In a cotton-picking machine, the combination of means for generating electricity, and a movable collector whose movement is independent of such generating means, said collector being located in inductive relation to said generator so as to be charged therefrom by induction.

3. In a cotton-picking machine, the combination of a rotating generator of electricity, and a rotating collector moving at a different speed from said generator and located in inductive relation thereto so as to be charged therefrom by induction.

4. In a cotton-picking machine, the combination of a generator of electricity inclosed in a closed casing, and a collector outside of

said casing and charged by said generator, and means for moving said collector independently of said generator.

5. In a cotton-picking machine, the combination of a generator of electricity inclosed in a closed casing, means for drying the air within said casing, a collector outside of said casing and charged by said generator but movable independently thereof.

6. In a cotton-picking machine, the combination with an electrical generator, a movable collector moving in the field of influence of said electrical generator and charged therefrom by induction, and a receptacle for cotton placed beneath said collector, whereby the cotton which is collected and discharged by the varying electrification of said collector, will be caught by said receptacle.

7. In a cotton-picking machine, the combination with a rotating generator of the influence type, of a rotating collector located in inductive relation to said generator, and means for driving the collector and generator independently, the generator being driven at a higher rate of speed than the collector.

8. In a cotton-picking machine, the combination of two electrified disk collectors rotating in parallel planes and adapted to pick from two rows of cotton at once and an electrical generator located between, and in inductive proximity to both of said disk collectors.

9. In a cotton-picking machine, the combination of a collector-disk, a rotary influence-generator having a rotating disk adjacent to the collector-disks and having two brushes at opposite points.

10. In a cotton-picking machine, the combination with an inclosed electrical generator, of a collector movable independently of said generator and located in inductive relation thereto so as to be charged by induction therefrom.

602,077. BRUSH. HARVEY W. HASCY, Hempstead, N. Y. Filed Aug. 3, 1897. Serial No. 646,884. (No model.)

Claim.—1. A "socket-brush" comprising a handle having a bristle-receiving opening therein, bristles contained within said opening, and a ferrule having a hollow extension within the bristle-receiving opening in the handle and surrounding the bristles contained therein and a flanged portion surrounding the lower end of the handle and secured thereto.

2. A "socket-brush" comprising a handle having a longitudinal bristle-receiving opening in one end thereof, bristles received within said opening and a ferrule having a hollow extension within the bristle-receiving opening in the handle and surrounding the bristles contained therein and a flanged portion surrounding the lower end of the handle and spun into a groove formed in the sides of said handle, substantially as described and for the purposes specified.

602,078. TROUSERS-CREASER. JOHN B. HOLMES, Albany, N. Y. Filed June 30, 1897. Serial No. 643,045. (No model.)

Claim.—In an apparatus for creasing trousers, the parallel slats A and B adapted to receive the bottoms of a pair of trousers, and the cams C C adapted to press the said slats together, in combination with the longitudinal slats D E and D E adapted to receive the fold edges of the sides of the trousers, and the springs F F adapted to press said slats together, and means for pivotally connecting the upper ends of the slats D D to the slat E and the slat H for securing together the free ends of the longitudinal slats D D, substantially as described and for the purpose set forth.

602,079. CAR. IVES J. HOYT, Watseka, Ill. Filed June 30, 1897. Serial No. 643,867. (No model.)

Claim.—The combination with a car, of the brackets mounted thereon near the top thereof and provided with slotted horizontal arms, a transverse safety-platform arranged on the brackets and having its upper face flush with the top of the car, fastening devices depending from the platform, passing through the slots of the brackets and engaging the latter, and cushioning-springs interposed between the platform and the car, substantially as and for the purpose described.

602,080. URINAL-PAN. THOMAS H. HUTCHINSON, Brooklyn, N. Y. Filed May 16, 1896. Serial No. 591,770. (No model.)

Claim.—1. The herein-described urinal-bowl having upper and lower pans integral therewith, said upper pan being designed to be flushed from the front toward the rear, and said lower pan being flushed from the rear toward the front, the forward portion of said lower pan being extended beneath the inner portion of said upper pan, a depending portion of said upper pan being beneath the level of the water of the lower pan, and an outlet with which said lower pan communicates, the rear wall of the bowl extending above the point where the rearward flush enters, substantially as set forth.

2. The herein-described urinal-bowl, having upper and lower pans integral therewith forming passage-ways between themselves and between said lower pan and the bottom of the urinal, and an outlet into which said latter passage-way opens, said upper pan being flushed from the front toward the rear, and said lower pan from the rear toward the front, said upper pan being provided at its rear end with a depending portion which intercepts the water-level of said lower pan the rear wall of the bowl extending above the point where the rearward flush enters, substantially as set forth.

3. The herein-described urinal-bowl having an upper water-chamber, a depending pipe leading therefrom, a hollow rim also leading from said chamber and slotted at the front end of the bowl, upper and lower pans integral with said bowl, said upper pan extending from the front end of said bowl to near the rear wall thereof, and said lower pan extending from said rear wall to near the front wall of said bowl, said depending pipe opening onto said lower pan beneath the water-level thereof, and said upper pan having at its rear end a depending portion which intercepts the water-level of said lower pan, substantially as set forth.

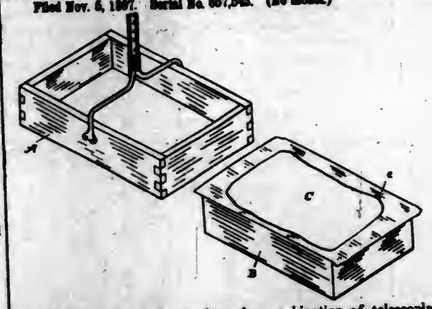
4. The herein-described urinal-bowl having an upper water-chamber, a depending pipe leading therefrom, apertures being formed in the bottom of said chamber, a hollow rim also leading from said chamber and having a series of perforations facing the side walls of the bowl, and a slot at the front end of the bowl, upper and lower pans integral with said bowl, said upper pan extending from the front end of said bowl to near the rear wall thereof, and said lower pan extending from said rear wall to near the front wall of said bowl, said depending pipe opening onto said lower pan beneath the water-level thereof, and said upper pan having at its rear end a depending portion which intercepts the water-level of said lower pan, substantially as set forth.

602,081. TRACK-CLEANER. JOHN HYDE, Trenton, N. J. Filed July 20, 1897. Serial No. 645,245. (No model.)

Claim.—1. A track-cleaner having a guide, a brush hub or slide mounted for axial and rotary movement in the guide and yieldingly held in its depressed position, and an interlocking connection, consisting of axially-disposed grooves or channels in one of said members, one of said grooves terminating short of the others at its lower end and a feather or web on the other member to engage one of said grooves or channels, to maintain the hub or slide at the desired rotary adjustment while permitting upward axial movement, substantially as specified.

2. A track-cleaner having a tubular guide, a spring-depressed brush hub or slide fitted for axial and rotary adjustment in the guide and yieldingly held in its depressed position, said guide being provided with a plurality of grooves or channels, extending to the upper end of the guide, one of the grooves having its lower end above the plane of the others and a feather or web carried by the hub or slide for engaging either of said grooves or channels, and adapted to be disengaged at the upper ends thereof, substantially as specified.

3. A track-cleaner having a tubular guide provided with a plurality of interior main grooves or channels, and a false or auxiliary groove or channel of less depth than the main grooves or channels, and a brush hub or slide fitted for axial and rotary movement in the guide and yieldingly held in its depressed position, said hub or slide being provided with a radial feather or web to engage one of said grooves or channels, substantially as specified.

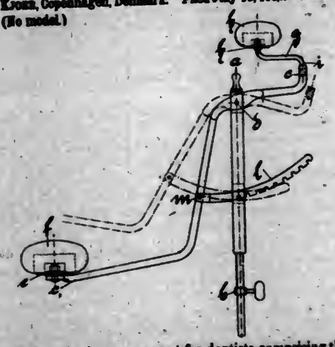


4. A track-cleaner having a guide provided with a bracket adapted to be attached to a car-truck, a brush hub or slide fitted for axial and rotary adjustment in the guide, and fitted with a stem and an operating-handle, a feather or web carried by the hub or slide to engage either of a plurality of grooves or channels in the wall of the guide, a stop-pin for limiting the depression of the hub or slide, and an actuating plate-spring attached to the bracket and bearing upon a shoulder or offset portion of the hub or slide, to yieldingly hold the latter in its depressed or operative position, substantially as specified.

5. A track-cleaner having a tubular guide provided with a bracket for attachment to a car-truck, a brush hub or slide fitted for axial and rotary adjustment in the guide and terminating at its lower end in a brush-seat, a feather or web carried by the hub or slide to engage either of a plurality of grooves or channels in the wall of the guide, a reduced stem extending axially from the hub or slide and terminating in a removable operating-handle, a removable stop-pin fitted transversely in the hub or slide to limit the downward movement thereof, and an actuating plate-spring attached to the bracket and bearing terminally upon the upper end of the hub or slide, to hold the latter yieldingly in its depressed position, substantially as specified.

602,082. COMPOSITION FOR ROADWAYS, TILES, &c. JOB JOHNSON, Glendale, N. Y. Filed Nov. 6, 1897. Serial No. 657,622. (No specimens.)

Claim.—A composition for roadways, tiles and the like consisting of clay, sharp sand, hard-coal dust, pulverized rock-salt, charcoal-dust and water, in about the proportions specified.

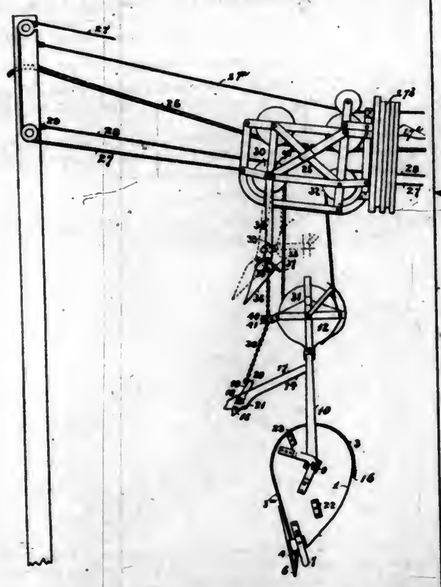


602,083. FLY-CATCHER. CHARLES A. KIESER, Louisville, Ky. Filed Nov. 5, 1897. Serial No. 657,543. (No model.)

Claim.—1. In a fly-catcher, the combination of telescoping frames, sticky fly-paper adapted to be clamped between said telescoping frames, and an adjustable handle secured to said frames, substantially as described.

2. In a fly-catcher, the combination of the outer frame A, the inner frame B, the fly-paper C, having a plain edge *c* adapted to be engaged between said inner and outer frame, which are constructed to telescope with each other, a bail arranged to be secured to the sides of said outer frame, having a hollow threaded extension at its center, and a handle provided with a screw-thread at one end adapted to engage with said extension, substantially as described.

602,084. ARM-SUPPORT FOR DENTISTS. LAURITS P. J. V. KJÆR, Copenhagen, Denmark. Filed July 10, 1897. Serial No. 644,060. (No model.)



Claim.—1. An arm-support for dentists comprising the combination of a rod *a*, adapted for application to a dental chair, a bent and pivoted rod constituting an arm-support, and a segmental rack-bar interposed between said arms, substantially as described, for adjusting said parts.

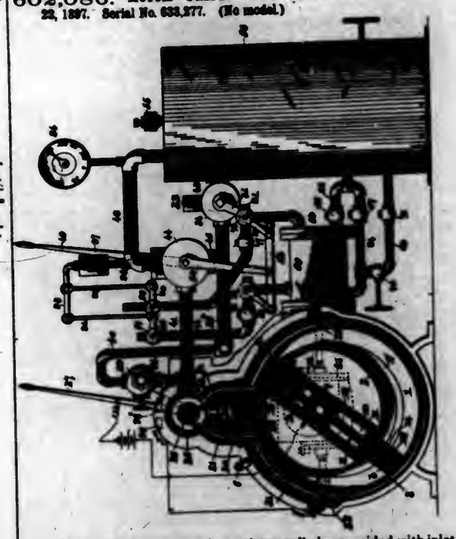
2. An arm-support for dentists comprising the combination of a rod *a*, a clamping-ring *b*, a bent rod pivoted to the rod *a*, and having arm-supports at its ends, and a segmental rack-bar interposed between said rods, substantially as described.

3. In combination a rod, as *a*, a bent rod pivoted to the rod *a*, and provided at one end with an arm-support, and a third bent rod pivoted to the other end of the second rod and provided with an arm-support, substantially as described.

602,085. **CONVEYING APPARATUS.** FRANK B. KNIGHT, Brooklyn, N. Y. Filed Oct. 5, 1897. Serial No. 654,100. (No model.)

Claim.—1. In a hoisting apparatus, in combination, a fall-block, a bucket pivotally sustained by said fall-block with its center of gravity above said pivots, a latch whereby said bucket is maintained in a non-dumping position, a dumping member adapted for disengaging said latch and a dumping-member actuator relatively to which said fall-block has a movement; said dumping member and actuator being adapted to interlock as the fall-block descends, substantially as described.

2. In a hoisting apparatus, in combination, a fall-block, a bucket pivotally sustained by said fall-block with its center of gravity above said pivots, a latch whereby said bucket is maintained in a non-dumping position, a dumping member adapted for disengaging said latch and a dumping-member actuator relatively to which said fall-block has a movement and a carriage supporting both said fall-block and said dumping-member actuator; said dumping member and actuator being adapted to interlock as the fall-block descends, substantially as described.



3. In a hoisting apparatus, in combination, a fall-block, a bucket pivotally sustained by said fall-block with its center of gravity above said pivots, a latch whereby said bucket is maintained in a non-dumping position, a dumping member adapted for disengaging said latch, a dumping-member actuator relatively to which said fall-block has a movement and a trigger connected with said latch and said dumping member; said dumping member and actuator being adapted to interlock as the fall-block descends, substantially as described.

4. In a hoisting apparatus, in combination, a fall-block, a bucket pivotally sustained by said fall-block with its center of gravity above said pivots, a latch whereby said bucket is maintained in a non-dumping position, a dumping member adapted for disengaging said latch and a dumping-member actuator relatively to which said fall-block has a movement and a rest connected with the fall-block whereby said dumping member is normally supported substantially as described.

5. In a hoisting apparatus, in combination, a fall-block, a bucket sustained by said fall-block, a latch whereby said bucket is maintained in a non-dumping position, a dumping member adapted for disengaging said latch, a dumping-member actuator relatively to which said fall-block has a movement and a guard whereby the mouth of said dumping-member actuator is controlled, substantially as described.

6. In combination, the hook 34, a projection therefrom carrying the inclined surface 36, a pivoted guard 37 lying across the mouth of said hook, a member 39, means for reciprocating said member relatively to said hook and dumping mechanism connected with said member, substantially as described.

602,086. **MOTOR.** FRANK M. MACKEY, Elmira, N. Y. Filed Apr. 22, 1897. Serial No. 633,877. (No model.)

Claim.—1. A motor having a piston-cylinder provided with inlet and exhaust ports, a reservoir, and valve mechanism, whereby either of said ports may be arranged in communication with the reservoir and the other exposed to the atmosphere, to adapt the reservoir to act alternately as a dispenser and a receiver, substantially as specified.

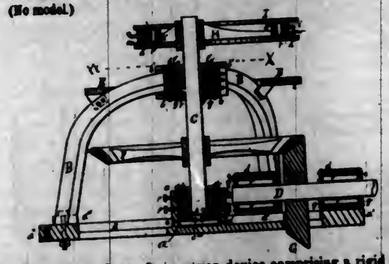
2. A motor having a piston-cylinder, a reservoir, supply and exhaust conveyers connecting the reservoir respectively with the inlet and exhaust ports of the cylinder, and valves controlling said conveyers and contiguous ports exposed to the atmosphere, whereby the reservoir is adapted to act alternately as a dispenser and a receiver, substantially as specified.

3. A motor having a piston-cylinder, a reservoir, supply and exhaust conveyers connecting the reservoir respectively with the inlet and exhaust ports of the cylinder, and supply and cut-off valves for controlling said conveyers and having their casings provided respectively with suction and outlet ports either of which is adapted to be arranged in communication with the conveyer when the contiguous valve is arranged to cut off communication between said conveyer and the reservoir, substantially as specified.

4. A motor having a piston-cylinder, a reservoir, supply and exhaust conveyers connecting the reservoir respectively with the inlet and exhaust ports of the cylinder, supply and cut-off valves controlling the conveyers and having their casings provided respectively with suction and outlet ports which are adapted to be arranged respectively in communication with said conveyers when the valves are arranged to cut off communication between the conveyers and the reservoir, and means for communicating simultaneous movement to said valves whereby when one is arranged to cut off communication between the conveyer and the reservoir, the other is adjusted to open communication with the reservoir, substantially as specified.

5. A motor having a piston-cylinder, a reservoir adapted to perform the function of a vaporizing-retort, a heating device, a sprayer arranged in the reservoir, pump mechanism in connection with the sprayer and provided with an inlet-pipe, supply and exhaust conveyers connecting the reservoir with the inlet and exhaust ports of the cylinder, supply and cut off valves for controlling said conveyers and having their casings provided with suction and outlet ports, means for simultaneously operating said valves to open communication between the reservoir and one conveyer and cut off communication between the reservoir and the other conveyer, and a controlling-valve, arranged in said inlet-pipe of the pump mechanism, operatively connected with the supply and cut-off valves, and having its casing provided with a suction-port, substantially as specified.

6. A motor having a piston-cylinder, a reservoir adapted to perform the function of a vaporizing-retort and having independent communication respectively with the inlet and exhaust ports of the cylinder, valve mechanism for controlling communication between the reservoir and said ports and also controlling suction and outlet ports adapted to be arranged in communication, respectively, with the inlet and exhaust ports of the cylinder, a heating device for the reservoir, a sprayer arranged in the reservoir, a pump mechanism having outlet-ports communicating with the supply-pipe which is connected with the sprayer and also having inlet-ports adapted to admit different fluids for discharge into said supply-pipe, and controlling-valves for the inlet-ports of the pump, operatively connected with the said valve mechanism for controlling communication between the reservoir and the ports of the cylinder, said controlling-valves having their casings provided with suction-ports, substantially as specified.



7. A motor having a piston-cylinder, a reservoir adapted to perform the function of a retort, means of communication between the reservoir and the inlet and exhaust ports of the cylinder, valve mechanism for controlling said communication, and also controlling suction and outlet ports adapted to be arranged in communication respectively with the inlet and exhaust ports of the cylinder, a heating device, a pump mechanism for supplying motive agent to the reservoir and having its cylinder in communication with inlet-pipes, controlling-valves in said inlet-pipes operatively connected with said valve mechanism for controlling communication between the reservoir and the ports of the cylinder, the controlling-valve casings having suction-ports, and governor-valves arranged in said inlet-pipes, and a diaphragm exposed to the pressure of the contents of the reservoir and operatively connected with the governor-valves, substantially as specified.

8. A motor having high and low pressure piston-cylinders, supply and exhaust conveyers respectively in communication with the inlet and exhaust ports of said cylinders, and a four-way controlling-valve having its casing in communication at diametrically opposite points with the high-pressure supply and the low-pressure exhaust ports, and also in communication at diametrically opposite points with the high-pressure exhaust and the low-pressure supply ports, substantially as specified.

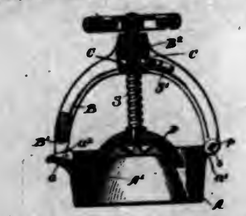
9. A motor having an eccentric piston-cylinder, and a dividing-gib arranged between the feed-ports, said gib being longitudinally expansible and comprising sections having overlapping contiguous extremities, a tube connecting the sections longitudinally to form a guide therefor, and an expansion-spring housed in the tube, and bearing terminally against the gib-sections, substantially as specified.

10. A motor having a cylinder, a controlling-valve for the ports of the cylinder, a rotary piston, opposite contact or sparking points, spaced terminals connected respectively with the contact-points, and an operating-lever for said valve adapted to perform the function of a switch to contact with either of said terminals, said lever being included in an electrical circuit which also includes the piston, substantially as specified.

602,087. **DEVICE FOR DISTRIBUTING AND EQUALIZING POWER.** RUSSELL MARVIN, Findlay, Ohio, assignor of one-half to S. M. B. Priddy, same place. Filed May 10, 1897. Serial No. 635,969. (No model.)

Claim.—1. A frame for a power device comprising a rigid cast bed A, having at its center a socket *a*; posts or risers B rigidly attached to bed A, and curving inwardly, meeting at their upper concaved ends *b*, about the vertical axis of socket *a*, and adapted by bolts through flanges *b'* to be solidly fastened together; and a ring E having holes *e*, said ring encircling and rigidly attached to posts B, substantially as above described.

2. In a frame of a power device, the combination of a bed-piece A, having a socket *a* at its center, and posts B rising from its perimeter and curving inwardly meeting by concaved ends about the vertical axis of said socket *a*, with a ring E, rigidly attached to posts B, and having holes *e*, as and for the purpose above described.



3. In a power device a bearing for a vertical shaft D, comprising antifriction-rolls *r*, a hard thin metal bushing *s*, its wall severed by a diagonal slit J; a heavy bushing of softer metal *s'* and set-screws *p* and *p'* for adjusting and holding said bushings substantially as and for the purpose specified.

4. In a power device the combination of an antifriction-bearing sustaining the weight of a rotating vertical shaft C, comprising a terminal cap *c* to said shaft, having on its under side a groove *c''*, a bearing-plate *c'* having a corresponding groove *c''* said grooves containing balls *c'''*, with an antifrictional bearing sustaining the lateral strain of said shaft C, comprising rolls *r*, a thin hard-metal bushing *s*, a softer heavy bushing *s'* and set-screws *p* and *p'*; both said bearings being contained in a socket *a*, substantially as and for the purpose above specified.

5. In a power device, the combination of a frame comprising a cast bed-piece A, provided at its center with a socket *a*, adapted to contain a bearing for the foot of a rotating vertical shaft C; risers or posts B securely fastened at their feet to said bed-piece A, curving inwardly and meeting by upper concaved ends *b*, and adapted to be solidly fastened by flanges *b'* about the vertical axis of socket *a*, and to receive within the orifice formed by said concaved ends *b*, a bearing for the upper end of said vertical shaft C, with a vertical shaft C, adapted to be rotated and bearing solidly attached thereto wheel F, and eccentric-wheel H, with an encircling ring I, substantially as and for the purpose above described.

6. In an eccentric device for converting rotary motion into reciprocating motion comprising the eccentric-wheel H, solidly mounted upon a vertical rotating shaft C, and bearing loosely mounted on a flange *h* by travelers, an encircling non-rotating ring I, said eccentric H and ring I having between them an antifrictional bearing formed by a series of vertical rolls *r'* broken into sections by rectangular shoes *l*, the combination of such eccentric H and ring I with rolls *r'* and shoes *l*, as and for the purposes above described.

602,088. **LEMON-SQUEEZER.** CHARLES MORGAN, Freeport, Ill. Filed Aug. 20, 1897. Serial No. 648,913. (No model.)

Claim.—1. In a lemon-squeezer, the combination with a bowl and an internal cone formed thereon, of a bail hinged at one end to the bowl by means of a pivot in one part, passing through a slot in the other part, a screw supported in the bail and a shell mounted on the end of the screw and adapted to be forced toward the cone, the free end of the bail and the corresponding point on the bowl being formed with coacting parts adapted to interlock, when the pivot of the bail and bowl is in one position in its slot, but to be free from each other when the pivot is in a different position, substantially as described.

2. The combination with the bowl having the internal cone and formed with ears *a'*, and lips, a^3, of the bail, B, having the inclined slot, *s*, and hooks adapted to engage the lips, a^3, the pivot, *p*, passing through the ears, *a'*, and slot, *s*, the screw, S, mounted in the bail and the shell, D, mounted on the screw; substantially as described.

3. In a lemon-squeezer, or analogous device, the combination with a suitable bowl and vertically-reciprocating plunger, of a bail or bridge in which said plunger is mounted said bridge being adapted to hook to the bowl upon one side by lateral movement with respect thereto and being pivotally connected to the bowl upon the opposite side so as to be capable of oscillation thereupon and also of lateral movement with respect thereto, whereby by moving said bail laterally with respect to the bowl, its free end may be engaged therewith or disengaged therefrom as desired; substantially as described.

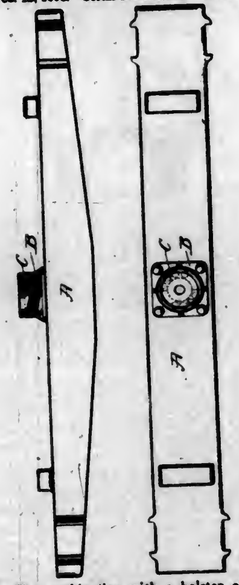
4. In a lemon-squeezer or analogous device the combination with a suitable base or bowl and a plunger adapted to compress the lemon or other article between it and the base or bowl, of a bail or bridge supporting the plunger, said bail or plunger having upon one end a hook adapted to engage the base or bowl by lateral movement with respect thereto and being pivoted to the base or bowl at the opposite side by means of a pivot and slot, one portion of said slot being nearer to the hook when in engagement with the bowl than remaining portions; substantially as described.

602,089. **CENTER-BEARING.** PETER H. MURPHY, East St. Louis, Ill. Filed Feb. 12, 1896. Serial No. 670,022. (No model.)

Claim.—1. The combination with a bolster, of a center-bearing, and a wedge operating between said bolster and center-bearing, substantially as described.

2. The combination with a bolster, of a vertically-movable center-bearing, a wedge operating between said bolster and center-bearing, and a locking-block for locking said wedge in an adjusted posi-

tion, said wedge holding said locking-block in place substantially as described.



3. The combination with a bolster, of a vertically-movable center-bearing, a wedge which operates between said bolster and center-bearing, and a locking-block formed with a flange fitting in said wedge, substantially as described.

4. The combination with a bolster, of a vertically-movable center-bearing having guiding-flanges which embrace the side walls of the bolster, a wedge operating between said bolster and center-bearing, a locking-block for said wedge, and a bolt E, substantially as described.

5. The combination with a bolster, of a center-bearing having guiding-flanges *b*, an inclined face *b'* on its under side, and shoulders *b''* on each side of said inclined face, a slotted wedge C having a recessed portion *c'* in its head, and a locking-block D having a flange *d*, and a projection *d'*, substantially as described.

602,090. CENTER-BEARING. PETER H. MURPHY, East St. Louis, Ill. Filed Feb. 12, 1896. Serial No. 670,023. (No model.)

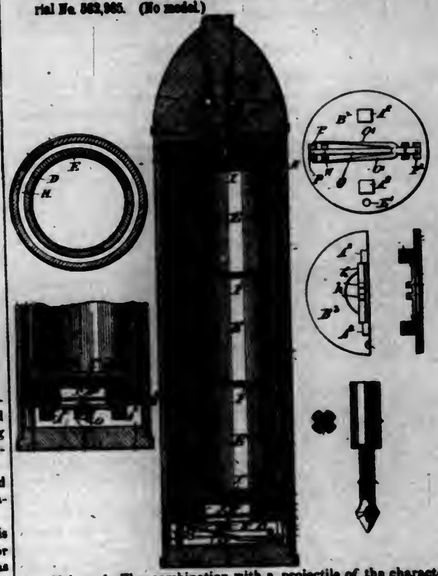
Claim.—1. The combination with a bolster, of concentrically-arranged projections rising therefrom, said projections being formed with inclined faces, and a center-bearing formed with corresponding projections having correspondingly inclined faces to match said bolster projections, substantially as described.

2. The combination with a bolster, of a center-bearing, and means for adjusting said center-bearing vertically and revolubly, relative to said bolster, substantially as described.

3. The combination with a bolster, of a center-bearing which is vertically and revolubly adjustable relative thereto, and means for locking said center-bearing in its adjusted position, substantially as described.

4. The combination with a bolster having inclined lugs, of a center-bearing having matching lugs, and interlocking devices between said lugs, substantially as described.

5. The combination with a bolster provided with concentrically-arranged inclined lugs formed with projections or openings, of a center-bearing provided with concentrically-arranged inclined lugs to match said bolster-lugs, and converse parts on the inclined faces of the center-bearing lugs to engage the projections or openings of the bolster-lugs, substantially as described.



6. The combination with a bolster, of a bolster-plate B formed with projections *b*, said projections having openings *b'* arranged therein, a center-bearing C formed with projections *c*, and lugs *c'* on said projections to engage the openings *b'* of the projections *b*, substantially as described.

602,091. COMBINATION CURTAIN AND WINDOW-SHADE HOLDER. THOMAS MCCORMICK, Mount Pleasant, Pa. Filed Mar. 19, 1897. Serial No. 626,318. (No model.)

Claim.—A device of the class described comprising a horizontal guide-bar designed to be mounted on a window-frame and extend entirely across the same, a pair of slides located at the ends of the guide-bar and each constructed of a single piece of sheet metal provided at its inner edge with a perforated ear and having its upper and lower edges bent inward on themselves to form L-shaped flanges for engaging the upper and lower edges of the guide-bar, the rectangular clips mounted on the slides and arranged in vertical alinement, the pole-receiving brackets provided with oppositely-disposed arms having their terminals bent vertically in opposite directions and engaging said clips at the inner edges thereof to lock the brackets against upward or downward movement, the terminals of said arms being interlocked with the rectangular clips, whereby the brackets are prevented from swinging horizontally, and means for securing the slides at the desired adjustment, substantially as described.

602,092. VACUUM-PROTECTED HIGH-EXPLOSIVE SHELL. RICHARD J. MCKNOWN, Sault Ste. Marie, Mich. Filed Mar. 12, 1896. Serial No. 582,965. (No model.)

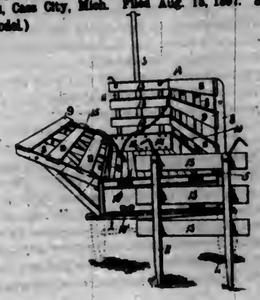
Claim.—1. The combination with a projectile of the character described, of a perforating firing-pin, having notches therein, and a detonator-ring upon the pin adapted to be exploded through said notches, said notches affording communication with the explosive material of the projectile, as set forth.

2. A high-explosive projectile comprising two casings, one elastically held within the other to form a vacuum-chamber between them, the inner one of said casings having a series of separated cells containing explosive material, an anvil having passage-ways therethrough and secured in the head of the projectile, a firing-pin working through said head and through the anvil and having notches or passage-ways therein, and a detonator-ring upon the pin to engage the anvil and explode the material in said cells, as set forth.

3. A high-explosive projectile comprising an outer shell or casing, head and breech plates removably secured in the ends of said casing, an inner casing elastically held between the said two plates to form a vacuum-chamber between the shells, the cells or cases secured in the inner shell and adapted to contain explosive material, a firing-pin having a pointed notched end to pierce the end of the inner casing, a detonator-ring secured to the pin, and a flexible nut through which a portion of the pin works, said nut being secured in the projectile-head and forming an anvil for the detonator-ring, whereby the latter is exploded, the said nut and the pin-notches affording communication with the cells, as set forth.

4. A high-explosive projectile comprising an outer shell, the head-plate, the breech-plate closing the end of the shell and having a thin central portion, an inner shell containing explosive material and elastically held between the said two plates, a removable end upon the inner shell having a thin central portion, a movable firing-pin working through the head-plate and adapted to break the thin portion of said end, and means attached to the breech-plate and actuated by pressure upon the thin portion of the breech-plate to indicate the degree of exhaustion of the inclosed air, as set forth.

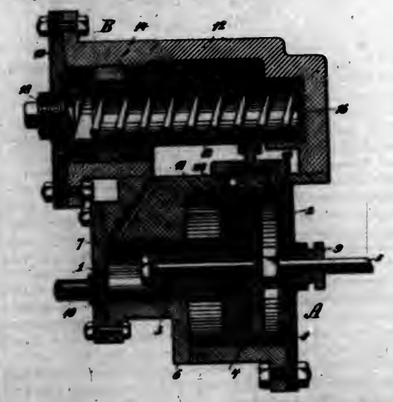
5. A firing-pin for high-explosive projectiles comprising a cylindrical body working through the projectile-head and having a detonator and a pointed notched end to pierce the inclosure containing the projectile explosive material and communicate the explosion of the detonator to said material, as set forth.



6. In an explosive projectile the combination of the outer shell, the head-plate, the breech-plate having a thin portion forming a diaphragm, an inner shell having an end the central portion of which is thinner than the body, a series of cells in the inner shell containing explosive material and separated by partitions, cushions engaging the ends of the inner and outer shells, and means upon the breech-plate, and operated by said diaphragm to indicate the degree of exhaustion of air from a chamber formed by the said two shells, as set forth.

7. The combination of the inner shell containing explosive material, and having an end provided with a thin portion, the outer shell, the head-piece, the head-plate having a screw-threaded extension to which the said head-piece is secured, the breech-plate having a thin central portion forming a diaphragm, a cushion engaging the head-plate and one of the inner shell ends and having a central aperture, a firing-pin working through said aperture and adapted to break the thin portion of the inner shell end, a cushion between the other end of the inner shell and the breech-plate, and having a space in which the diaphragm is operated, and a series of levers linked together and connected to the diaphragm to note the degree of exhaustion of air from the chamber formed between the said two shells, as set forth.

8. The combination with a projectile having a vacuum-chamber formed between the outer and inner shells of the projectile, of a vacuum-gage comprising a diaphragm in the projectile breech-plate, a graduated scale, a series of levers connected together and to the breech plate and operated by pressure upon the diaphragm to indicate upon the scale the degree of air exhausted from the chamber, as set forth.



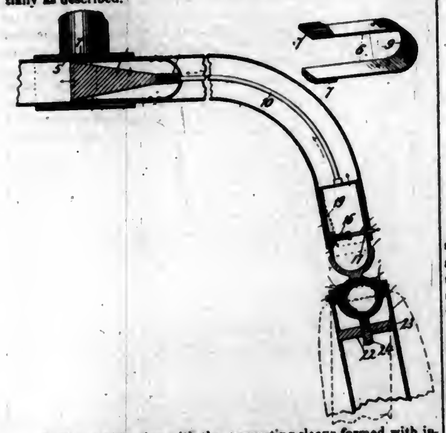
9. The combination with a high-explosive projectile, of an anvil secured in the projectile-head, a firing-pin having a notched end, and working through the anvil and through said head, and having a collar resting against the anvil, and a detonator upon the pin adapted to be exploded by contact with the anvil, said explosion being communicated to the projectile explosive material through said pin-notches, as set forth.

602,093. COMBINED GRAIN, HAY, AND STOCK RACK. ELIAS MCKIM, Cass City, Mich. Filed Aug. 18, 1897. Serial No. 648,651. (No model.)

Claim.—In a combined grain, hay and stock rack and wagon, the combination with the body thereof, provided on its sides with upright cleats, having eyes in their upper ends, and at its ends with angular metallic keepers, of side sections comprising vertical bars and horizontal slats, hooks secured to said side sections and adapted to engage said eyes, end sections comprising vertical bars and horizontal slats, said bars being adapted to enter said end keepers, hooks upon the end sections adapted to engage the side sections, a chain secured at its outer ends to the said sections for supporting the same one from the other, a hook secured to the wagon-floor adapted to engage the links of said chain for the purpose of adjusting the positions of said side sections relative one to the other, and bars pivotally connected to the vertical bars of the side sections, whereby the rear and middle portions of said sections are supported, as and for the purpose set forth.

602,094. AIR-BRAKE. JOHN J. HEP, New York, N. Y. Filed July 31, 1897. Serial No. 646,579. (No model.)

Claim.—1. The combination in an air-brake system of a pump and pump-operating mechanism of a compound air-cylinder comprising two cylinders of different diameters, a piston within said compound cylinder having heads of different diameters corresponding with the bores of said compound cylinder a valve-chamber in open communication with the smaller cylinder and having a port communicating with the larger cylinder and an exhaust-port, a valve in said valve-chamber, and means acting under variations in air-pressure for operating said valve to alternately open and close said larger cylinder to the valve-chamber and the exhaust, substantially as described.



2. The combination in an air-brake system of a pump and pump-operating mechanism, of a compound air-cylinder comprising two cylinders of different diameters, a piston within said compound cylinder having heads of different diameters corresponding with the bores of said compound cylinder, a valve-chamber having open communication with the smaller of said cylinders, and having a port connecting with the larger of said cylinders, an exhaust-port, and a valve controlling said ports whereby air is admitted to the larger cylinder to move the piston in one direction and exhausted therefrom to move it in the opposite direction, substantially as described.

3. The combination in an air-brake system of a pump and pump-operating mechanism, a compound air-cylinder comprising two cylinders of different diameters, a piston within said compound cylinder having heads of different diameters corresponding with the bores of said compound cylinder, a valve-chamber having open communication with the smaller of said cylinders and having a port connecting with the larger of said cylinders, an exhaust-port and means for controlling said ports whereby air is exhausted from the larger cylinder to allow the piston to move in one direction, and is admitted to said cylinder to move the piston in the opposite direction, substantially as described.

602,095. BICYCLE HANDLE-BAR AND HANDLE. GEORGE H. NEWELL, Gloucester, Mass. Filed Jan. 27, 1898. Serial No. 667,915. (No model.)

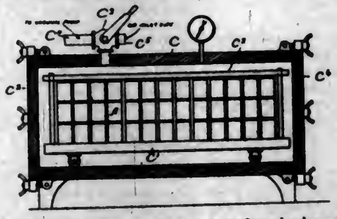
Claim.—1. The combination in a bicycle, or like machine, of a central supporting-sleeve having internal teeth or serrations, a hollow handle-bar arranged therein and provided with openings, a locking device arranged within the handle-bar and adapted to project through said openings and engage the teeth or serrations on the sleeve, a connection extending substantially to the handle at the end

of the bar for operating the locking device in one direction, and a spring for operating said device in the opposite direction; substantially as described.

2. The combination with the supporting-sleeve formed with internal teeth or serrations, and the handle-bar, provided with central openings, of locking devices comprising a toothed or serrated spring, a wedge for causing said spring to engage the serrations in the sleeve, an operating connection, and a catch device for securing the connection when the parts are in locked position; substantially as described.

3. The combination with the central supporting-sleeve and hollow handle-bar, of the toothed locking-spring, a wedge for causing said spring to engage the serrations in the sleeve, a connection secured to said wedge, a retracting-spring for the connection, and a sliding sleeve secured to the outer end of the connection; substantially as described.

4. The combination with the ball projecting from the handle-bar, of a tubular handle provided at its inner end with an inwardly-projecting ring or flange, a socket-bearing within the handle, and a connection between the handle and the bearing whereby the ball may be clamped within the socket by the turning of the handle; substantially as described.



5. In a bicycle, or the like, the combination of the steering-head stem and sleeve, a handle-bar rotatably adjustable in said sleeve, locking devices to secure the bar in different positions of adjustment, actuating mechanism for said locking devices, said mechanism being concealed and protected within the hollow of the bar, and a push-button projecting through a perforation in the handle-bar in proximity to the handle, whereby the actuating mechanism for the locking device may be released by the thumb or finger without disengaging the hand from the handle; substantially as described.

6. In a bicycle, or the like, the combination of the stem or steering-head and its sleeve, a handle-bar rotatably adjustable in said sleeve, locking devices to secure the bar in different positions of adjustment, actuating mechanism for said locking devices, said mechanism being concealed and protected within the hollow of the handle-bar and extending substantially to the handle at the end of the bar, a spring for holding the locking devices normally locked, and a push-button projecting through a perforation in the handle-bar near the handle and connected with said actuating mechanism, whereby the actuating mechanism for the locking devices may be released by the thumb or finger without removing the hand from the handle, and the adjustment of the bar effected while holding the handle; substantially as described.

7. The combination with a ball on the end of the handle-bar, of a handle provided with an internal socket-bearing, a screw-threaded stem for said bearing, a ring secured to the handle and encircling the ball on the opposite side of its center from the socket, and a threaded projection in the handle into which the stem of the socket screws, whereby the socket and the ring are clamped upon the ball; substantially as described.

8. The combination with a ball on the end of the handle-bar, of a handle provided with an internal socket-bearing, a screw-threaded stem for said bearing, said stem being constructed in two parts movable lengthwise only with respect to each other, a ring secured to the handle and encircling the ball on the opposite side of its center from the socket, a spring reacting between the parts of the socket-stem, and a threaded projection in the handle into which the stem screws, whereby the socket and the ring are clamped upon the ball; substantially as described.

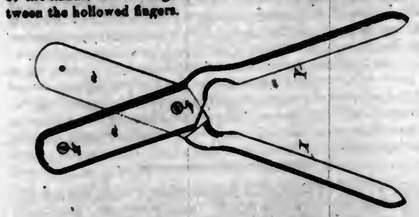
602,096. PROCESS OF CANNING FOOD. Erwin Horton, Maywood, Ill., assignor to the Horton Bros., Chicago, Ill. Filed Oct. 7, 1897. Serial No. 654,333. (No specimens.)

Claim.—1. The herein-described process of canning hermetically-sealed food, consisting in placing the food in cans provided with covers adapted to be sealed by atmospheric pressure, placing the cans with their covers in place within a receiver, exhausting the air in the cans, and sealing the covers on the cans by the sudden admission of air to the receiver, substantially as described.

2. The herein-described process of canning hermetically-sealed food, consisting in placing the food in cans provided with covers adapted to be sealed by atmospheric pressure, placing the cans with their covers in place within a receiver, exhausting the air in the cans, sealing the covers on by the sudden admission of air to the receiver, then locking the covers securely to the cans so as to form an air-tight mechanical seal, and finally cooking the contents while in vacuum, substantially as described.

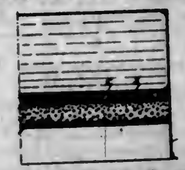
3. The herein-described process of canning hermetically-sealed food, which consists in placing the food in cans with covers for the entire top, placing such filled cans with their covers in place within a receiver, exhausting the air from the receiver, cans, and contents, and seaming the covers on the cans so as to form an air-tight mechanical seal, substantially as described.

4. The herein-described process of canning hermetically-sealed food, which consists in placing the food in cans with covers for the entire top, placing such filled cans with their covers in place within a receiver, exhausting the air from the receiver, cans, and contents, and seaming the covers on the cans so as to form an air-tight mechanical seal, then clamping the filled cans and processing the same to sterilize the contents, substantially as described.



5. The process of canning food or other articles, consisting in the following steps: first, filling the cans, next extracting the air therefrom, next sealing the covers on the cans with a vacuum seal, next locking the covers securely to the cans by seaming to prevent the escape of their contents or of steam or gases arising therefrom during the next or cooking step, and finally cooking the contents while in vacuum; substantially as shown and described.

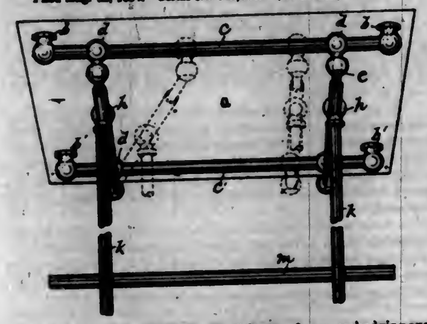
6. The process of canning hermetically-sealed food, consisting in the following steps: first filling the cans, next producing by mechanical means as near a perfect vacuum in the cans as practicable by removal of the air therefrom, next sealing the covers on the cans by seaming to prevent the return of air thereto and to prevent the escape of their contents or of steam or gases arising therefrom during the next or cooking step, and next cooking the food contained in the cans while in a vacuum, whereby the injurious effects upon the cans and contents of the air always heretofore sealed up in the cans with the food, is avoided, substantially as shown and described.



7. The herein-described process of canning hermetically-sealed food, consisting in placing the food in cans provided with covers adapted to be sealed by atmospheric pressure, placing the cans with their covers in place within the receiver, exhausting the air in the cans, and sealing the covers on by the sudden admission of air to the receiver, next removing the cans from the receiver and securely sealing the covers to the cans by a mechanical seal to prevent the escape of their contents or of steam or gases arising therefrom, next placing the cans in suitable clamps to prevent the action of the steam cooking from breaking the sealed joint between the cans and covers, placing the cans in a cooking-retort and sterilizing and cooking the contents while in vacuum, next removing the cans from the retort and cooling the contents, and next removing them from the clamps, substantially as shown and described.

602,097. ASPARAGUS-HOLDER. Christopher H. Oberle, New York, N. Y. Filed Apr. 26, 1897. Serial No. 633,113. (No model.)

Claim.—An asparagus-holder, comprising two jaws or sections each consisting of a grooved or hollowed finger, and a handle portion recessed at its inner end and flattened at its inner side, whereby the two handle portions may be closed one upon the other and overlapped to constitute a single flat grasping end for the device, in combination with a pivot for securing the handle-sections together, and a fastening device for detachably securing the outer overlapped ends of the handle-sections together to clamp the stalk of asparagus between the hollowed fingers.



602,098. PURIFYING CONDENSATION-WATER FROM OIL BY FILTRATION. Gustav Closius, Grevenbrück, Germany, assignor to the Maschinenfabrik Grevenbrück, Actiengesellschaft, same place. Filed Feb. 17, 1897. Serial No. 623,877. (No specimens.) Patented in Germany Mar. 22, 1894, No. 80,116, and in England Dec. 24, 1895, No. 24,708.

Claim.—1. The method of freeing the condensation-water of steam-engines from the lubricating-oil by filtration which consists in preparing a mixture of water and flaky mineral particles, separating the latter from the former by collecting them in the form of a thin layer on a permeable bed, and causing the condensation-water to filter through such mineral layer.

2. A filter for freeing condensation-water of steam-engines from lubricating-oil composed of a permeable bed and a thin mineral layer composed of calcareous mud which forms a layer of a flaky nature, substantially as described.

602,099. DISPLAY-FRAME. Joseph C. Palmer, Norwich, Conn. Filed Aug. 12, 1897. Serial No. 648,077. (No model.)

Claim.—1. The herein-described display-frame, embodying overhead ways, telescopic rods extending from one way to another and having swiveled connections therewith, and floating article-supporting rods slidably mounted on said telescopic rods, whereby said article-supporting rods have a universality of adjustment in horizontal planes, substantially as described.

2. The herein-described display-frame, consisting of the supporting-ways, collars slidably mounted thereon, the telescopic rods extending from way to way and swiveled at their ends upon said collars, the article-supporting rods extending at an angle with said telescopic rods and slidably mounted thereon at one end, and the bar connecting the other ends of said article-supporting rods together.

3. In a display-frame, the combination with the supporting-ways, and the collars loosely mounted thereon, of the plugs swiveled upon said collars, the telescopic tubes attached to said plugs, a perforated plug within one end of the smaller of said tubes, and a wire or rod in said smaller tube, said wire or rod extending through said perforated plug and having an enlarged free end designed to engage the same when the tubes are extended to their full limit, substantially as described.

4. In a display-frame, the combination with the supporting-ways, means between the ends thereof for supporting the same, and the collars slidably supported by said ways, said parts being relatively constructed to permit said collars to slide beyond said way-supports, of the telescopic rods having a swiveled connection with said collars, and the article-supporting rods carried by said telescopic rods, substantially as shown and described.

602,100. AXLE-BEARING FOR VEHICLE-WHEELS. Reuben C. Patterson, Summit, Ga. Filed Oct. 8, 1897. Serial No. 654,544. (No model.)

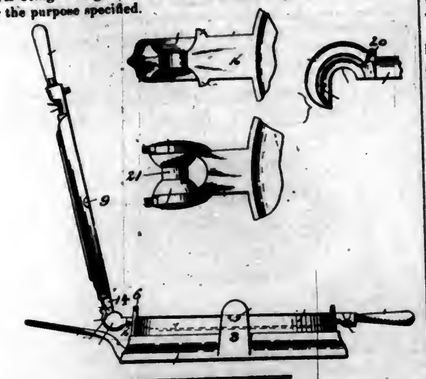
Claim.—1. In a device of the class described, the combination of an axle, conical bearing-sleeves mounted on the axle, a hub having an axle-box fitting the bearing-sleeves, said hub being provided at its ends with annular recesses, the inner and outer dust-caps mounted on the axle, extending over the ends of the bearing-sleeves and the axle-box and provided with annular flanges extending into the annular recesses of the hub, and an axle-nut, substantially as described.

2. In a device of the class described, the combination of an axle, a hub provided with an axle-box and having a central oil-supply passage, and conical bearing-sleeves mounted on the axle and provided at their upper faces with longitudinal grooves or gutters terminating short of the outer ends of the sleeves to close their outer terminals and adapted to return oil to the center of the bearing, substantially as described.

3. In a device of the class described, the combination of an axle, conical bearing-sleeves, a hub having an axle-box, dust-caps arranged at the ends of the axle-box and mounted on the axle, an axle-nut, and a central series of washers interposed between the adjacent ends of the bearing-sleeves and adapted to be removed to permit the bearing-sleeves to be advanced for taking up the wear, the washers removed from the central series being designed to be arranged on the axle between the outer dust-cap and the outer bearing-sleeve, substantially as described.

4. In a device of the class described, the combination of an axle, conical bearing-sleeves mounted on the axle and provided at their upper faces with longitudinal grooves or gutters terminating short of the outer ends of the sleeves and adapted to convey oil from the ends of the bearing to the center thereof, a hub having an oil-hole, and an axle-box provided at its outer face with a recess communicating with the oil-hole of the hub, said axle box being provided with an oil-passage extending from the recess to the bearing, substantially as described.

5. In a device of the class described, the combination of an axle, conical bearing-sleeves provided at their upper faces with longitudinal grooves or gutters terminating short of the outer ends of the sleeves, a hub having an oil-hole and provided at its ends with annular recesses, an axle-box provided with a central recess communicating with the oil-hole of the hub and with the center of the bearing, and dust-caps covering the ends of the axle-box and the sleeves and provided with annular flanges extending into the annular recesses of the hub, substantially as described.



6. In a device of the class described, the combination of a hub having an oil-hole, a plug fitting therein and provided at its outer end or head with a recess, and a spring mounted on the hub and engaging the recess of the plug, substantially as described.

602,101. WAFFLE-IRON. Earle C. Perry, Jeffersonville, Ind., assignor to the Indiana Manufacturing Company, same place. Filed Dec. 13, 1897. Serial No. 661,643. (No model.)

Claim.—1. In a waffle iron, the combination with the sections 7 and 8, of a hinge connection therefor comprising lugs carried by said sections, one of said lugs having a hook portion 17 with a curved bearing-face on its inner side and lateral shoulders 23, and the other section having a rounded portion and shoulders 20, and the said hook portion being adapted to loosely fit and have a turning movement upon the said rounded portion, and the sections being adapted to be separated at any point in the turning movement by lifting the section 8 and its lug rectilineally off or away from section 7 and its lug, all being arranged for coöperation as and for the purposes specified.

2. In a waffle-iron, the combination with the sections 7 and 8, of a hinge connection therefor comprising lugs carried by said sections adapted to engage and have a turning or pivotal movement one upon

the other, one of said lugs having a hook portion with inclined or beveled sides, and the other lug having a spool-shaped portion, said parts being arranged and adapted to cooperate in the manner and for the purpose specified.

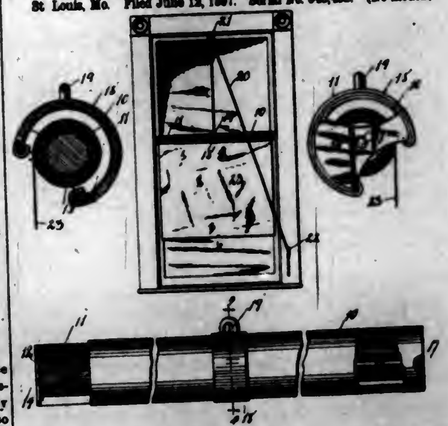
602,102. RAIL-JOINT. THEODORE F. PHILIPPI, St. Louis, Mo. Filed Aug. 18, 1897. Serial No. 648,437. (No model.)

Claim.—1. A rail-joint comprising a casing adapted to embrace the flanges and webs of two contiguous rails, and conforming in cross-section to that of the parts embraced, and means for simultaneously drawing the contiguous ends of the rails toward one another and also forcing said rails firmly against the bottom of the casing, substantially as set forth.

2. A rail-joint comprising a casing adapted to embrace the flanges and webs of two contiguous rails, and conforming in cross-section to that of the parts embraced, means for securing the vertical walls of the casing to the webs of the rails, and means for simultaneously drawing the contiguous ends of the rails toward one another and also forcing said rails firmly against the bottom of the casing, substantially as set forth.

3. A rail-joint comprising a casing adapted to embrace the lower flanges and webs of the adjacent ends of two rails, the web of each rail having suitable openings formed therein, and the vertical walls of the casing also having suitable openings adapted to normally but eccentrically aline with the openings of the webs, the said openings intersecting along the ends of a chord inclined toward the free end of the rail thus leaving sections of the metal of the web exposed along a diagonal line tending toward the center of the length of the casing, a key adapted to be forced through each of the alining openings whereby in the driving of the key the rails are forced toward each other and at the same time firmly against the bottom of the casing, the key having an opening at one of its ends, and a pin adapted to be passed through said opening whereby the vertical walls of the casing are drawn firmly against the webs, substantially as set forth.

602,103. CABINET. JOHN W. PLACE, New York, N. Y. Filed Feb. 20, 1897. Serial No. 624,367. (No model.)

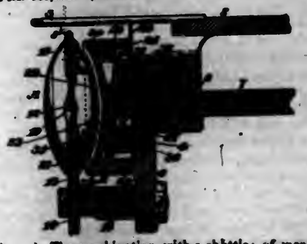


Claim.—1. In a cabinet, the combination with a revolubie base having on its upper side compartments and an outer circular wall, of a top F containing a sector-shaped opening and provided with top ledges f^2, f^3, and an independently-movable cover below the top F, such cover serving as a depressed rest, substantially as specified.

2. In a cabinet, the combination with a revoluble base having on its upper side compartments inclosed laterally by an outer circular wall, of a top F containing a sector-shaped opening and provided with top ledges f^2, f^3, and a well H, located in the top coincident with its vertical axis and that of the base, substantially as specified.

3. In a cabinet, the combination with a revoluble base having on its upper side a series of compartments and another circular wall, of a top F containing a sector-shaped opening and a central tubular bearing for both base and top, adapted for a bracket-arm pintle, and for permitting said base and top to revolve independently, substantially as specified.

602,104. ADJUSTABLE SHADE-SUPPORT. JOHN H. REINHARD, St. Louis, Mo. Filed June 12, 1897. Serial No. 640,452. (No model.)



Claim.—1. A curtain-support comprising a member 10 arched and having its opening in the bottom thereof, a member 11 arched and telescoping within the member 10, inturned flanges or hooks on the margins 10 engaging the margins of the members 11 and retaining the same in sliding engagement, cross-bars 12, 13, on the members 10, 11, which cross-bars are apertured to receive the pivots of a curtain-roller, a strap 18 slidingly mounted on the member 10, an eye 19 on said strap, a cord 20 secured at one end to the eye 19, a pulley 21 suitably supported and receiving the bight of the cord 20 and a stud to which the free end of the cord 20 is attached removably and replaceably.

2. An adjustable shade-support comprising arched metallic sections overlapping and telescoping upon each other, roller-supports integrally formed on extreme opposite ends of said sections and a hanger-strap adjustably mounted on the outer section approximately midway of the extreme opposite ends of the sections, in combination with a cord fixed at one end to the hanger-strap and means for supporting said cord.

3. In a device of the class described an arched metallic section, a cross-bar at one end of said section, an arched metallic section inclosing and telescoping upon the first said section, a cross-bar in the opposite end of the latter section, a strap movably mounted on the said section and an eye on said strap as set forth.

602,105. ACTUATING MECHANISM FOR SEWING-MACHINE LOOPERS. FRANCIS H. RICHARDS, Hartford, Conn. Filed Jan. 14, 1897. Serial No. 619,200. (No model.)

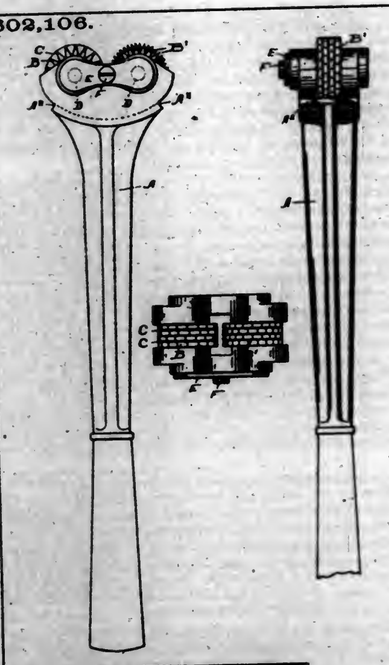
Claim.—1. The combination, with a shuttle: of means for operating said shuttle, consisting of a driving-shaft; a case having a series of equidistantly-disposed chambers located near the periphery thereof and also having a convex portion; a series of grooved driving-pins mounted in said chambers; a plate provided with a concavo-convex hub and with a series of peripheral projections engaging the walls of the chambers and adapted to engage the driving-pins; and an inclined plate fixedly secured to the framing and provided with a concave seat to receive the hub of said disk.

2. The combination, with a rotary shuttle having driving-sockets, of a rotary support having its axis of rotation coincident with that of the shuttle; means for rotating said support; a circuit of shuttle-driving pins carried by, and disposed transversely to the plane of rotation of, the support, and having on their inner sides transverse recesses facing toward the axis of rotation of such support; a pin-reciprocating actuator in engagement with the walls of said recesses in the driving pins and disposed in a plane at an inclination to the axis of rotation of the rotary support; and means for maintaining said actuator in said plane.

3. The combination, with a rotary shuttle having driving-sockets, of a rotary support having its axis of rotation coincident with that of the shuttle; means for rotating said support; a circuit of shuttle-driving pins carried by, and disposed transversely to the plane of rotation of, the support, and having on their inner sides transverse recesses facing toward the axis of rotation of such support; a rotary pin-reciprocating actuator in engagement with the walls of said recesses in the driving-pins, and rotatable in unison with, and in a plane at an inclination to the axis of rotation of, the rotary support; and means for maintaining said actuator in said plane.

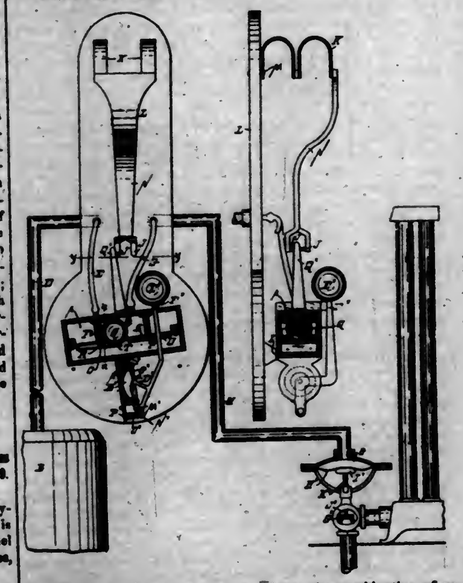
4. The combination, with a rotary shuttle having driving-sockets, of a rotary support having its axis of rotation coincident with that of the shuttle and having a series of chambers transverse to its plane of rotation; means for rotating said support; shuttle-driving pins carried in said chambers and disposed in a circuit, and having on their inner sides transverse recesses facing toward the axis of rotation of said support; a pin-reciprocating actuator disposed in a plane at an inclination to the axis of rotation of the rotary support, and having radial projections in engagement with the end walls of the recesses in the driving-pins and with the side walls of the chambers in the support, to thereby rotate in unison with said support; and means for maintaining said actuator in said plane.

5. The combination, with a rotary shuttle having driving-sockets, of a rotary casing having its axis of rotation coincident with that of the shuttle and having a series of chambers transverse to its plane of rotation; means for rotating said casing; shuttle-driving pins carried in said chambers and disposed in a circuit, and having on their inner sides transverse recesses facing toward the axis of rotation of such casing; a fixed member having a supporting-face inclined to the axis of rotation of the casing; and a pin-reciprocating actuator disposed in a plane at an inclination to such axis, and in engagement with the end walls of the recesses in the driving-pins, and between, and forming a universal joint with, the rotary casing and said fixed member.



6. In a sewing-machine, the combination, with framework, of a looper peripherally supported for rotation and having a series of driving-sockets, and driving mechanism comprising a driving-shaft journaled in said framework for rotation; a casing having an exteriorly-curved or convex hub and mounted on said shaft for rotation therewith and also having a series of transversely-extending chambers; a driver-pin mounted in each of said chambers for sliding movement, each of said pins having a transverse slot communicating with a slot in the inner wall of its respective chamber; a member fixedly secured to said framework and having an inclined face and having a centrally-disposed bore or opening provided with a curved or concaved wall; an actuator provided with a series of projections extending through the slots of the chamber-walls and engaging in the slots of the driver-pins, said actuator also having a concavo-convex hub fitting intermediate the hub of the casing and the concaved wall of the inclined faced member, for rotation with said casing, to thereby actuate said drivers laterally or transversely of said casing toward and from the looper, to engage and disengage in the sockets thereof.

602,106. TOOL FOR DRESSING EMERY-WHEELS. CHARLES E. ROGERS, Oak Park, Ill. Filed Aug. 12, 1897. Serial No. 647,909. (No model.)



Claim.—1. As a new article of manufacture, a Huntington emery-dresser, the handle of which is both bifurcated and widened, and is provided with two sets of dressing devices supported upon parallel pivots, and with a shoulder A^2 under each set of the dressing devices, substantially as set forth.

2. As a new article of manufacture, a Huntington emery-dresser, the handle of which is both bifurcated and widened, and is provided with two sets of dressing devices supported upon parallel removable pivots, and with a pivot-keeper E acting upon both pivots, substantially as specified.

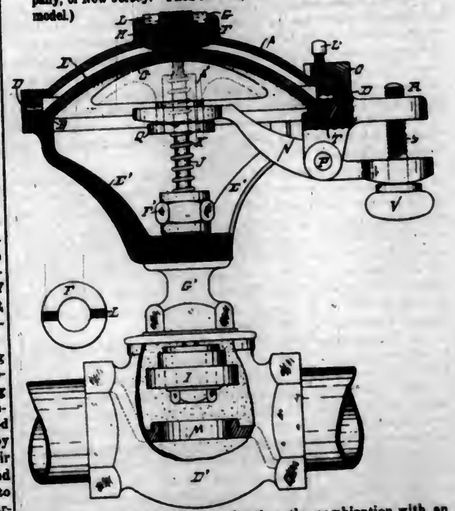
602,106.

602,107. TEMPERATURE-REGULATOR. ALFRED ROESCH, Bridgeport, Conn., assignor to the Davis & Roesch Temperature Controlling Company, of New Jersey. Filed July 24, 1897. Serial No. 645,844. (No model.)

Claim.—1. In a temperature-regulator, the combination of an oscillating valve-chamber; an inlet air-duct communicating between said valve-chamber and an air reservoir; an outlet air-duct communicating from said valve-chamber with the diaphragm-chamber of a steam-controlling valve; inlet and outlet air-controlling valves, both

located within said valve-chamber and provided with supporting-bearings, by which said valves are automatically thrown in contact with their respective seats; a rolling weight or ball located in said valve-chamber and adapted as said chamber is oscillated toward the right and left, to roll of its own gravity from one side of said valve-supporting bearings to the other, whereby said valves are alternately opened and closed by the gravity of said weight; and means under control of a thermostat for actuating said oscillating valve-chamber, substantially as and for the purpose specified.

2. In a temperature-regulator, the combination of an oscillating valve-chamber; an inlet air-duct communicating between said valve-chamber and an air-reservoir; an outlet air-duct communicating from said valve-chamber with the diaphragm-chamber of a steam-controlling valve; inlet and outlet air-controlling valves both located within said valve-chamber and provided with supporting-bearings by which said valves are automatically thrown in contact with their respective seats; a weight or ball located in said valve-chamber and adapted, as said chamber is oscillated toward the right and left, to roll of its own gravity from one side of said valve-supporting bearings, to the other, whereby said valves are alternately opened and closed by the gravity of said weight; means for actuating said oscillating valve-chamber; retaining-catches adapted to automatically engage the bearings of said valve-chamber at each end of its oscillatory movement and a thermostat, adapted as it is moved by the changes of temperature, to release said oscillating chamber from engagement with said retaining-catches, substantially as and for the purpose specified.



3. In a temperature-regulator, the combination of an oscillating valve-chamber; an inlet air-duct communicating between said valve-chamber and an air-reservoir; an outlet air-duct communicating from said valve-chamber with the diaphragm-chamber of a steam-controlling valve; inlet and outlet air-controlling valves both located within said valve-chamber and provided with supporting-bearings by which said valves are automatically thrown in contact with their respective seats; a weight or ball located in said valve-chamber and adapted, as said chamber is oscillated toward the right and left, to roll of its own gravity from one side of said valve-supporting bearings, to the other, whereby said valves are alternately opened and closed by the gravity of said weight; a diaphragm-chamber formed in connection with said oscillating valve-chamber; an air-duct communicating between said valve-chamber and said diaphragm-chamber; a weight-supporting arm pivotally connected with said valve-chamber; a diaphragm plate or bearing communicating between the diaphragm of said diaphragm-chamber and said weight-supporting arm and adapted to move said weight and arm in one direction, past the center of gravity, as said diaphragm is extended by the admission of compressed air; a counteracting spring communicating between the stationary bearing of said valve-chamber and said weight-supporting arm and adapted, when relieved from the action of the compressed air in said diaphragm-chamber, to throw said weight-supporting arm in the opposite direction; an oscillating extension-arm formed in connection with said valve-chamber and adapted, as said chamber is oscillated, to be brought in contact with retaining-catches; a thermostat rigidly affixed to one end of a supporting bed-plate; an arm affixed at one end to the free end of said thermostat; retaining-catches affixed to the free end of said arm; and an oscillating arm or bearing extending from said valve chamber and adapted to engage the catches supported from said thermostat, all substantially as and for the purpose specified.

4. An oscillating valve-chamber having inlet and outlet ports, an exhaust-port, valves controlling said inlet and exhaust ports and normally closing said ports, a rolling weight or ball controlling the movement of said valves and adapted to retain one or the other alternately in an open position as said valve-chamber is oscillated, substantially as described.

5. An oscillating valve-chamber having inlet and outlet ports, an exhaust-port, valves controlling said inlet and exhaust ports and normally closing said ports, a rolling weight or ball controlling the movement of said valves and adapted to retain one or the other alternately in an open position as said valve-chamber is oscillated, and a weighted arm pivoted to said valve-chamber and adapted to swing on said pivot to oscillate said valve-chamber, substantially as specified.

6. In a temperature-regulator the combination with an oscillating valve-chamber having inlet and outlet ports, an exhaust-port, valves controlling said inlet and exhaust ports and normally closing said ports, a rolling weight or ball controlling the movement of said valves and adapted to retain one or the other alternately in an open position as said valve-chamber is oscillated, and a weighted arm pivoted to said valve-chamber and adapted to swing on said pivot to oscillate said valve-chamber, and a thermostat governing said oscillating movement of said valve-chamber, of connections between said inlet-port and a fluid-reservoir, connections between said outlet-port and fluid-actuated mechanism and means whereby said weighted arm is swung in one direction by the fluid admitted to said valve-chamber from said reservoir and is permitted to swing in another direction when said fluid is exhausted therefrom, substantially as specified

602,108. DIAPHRAGM-CHAMBER. ALFRED ROESCH, Bridgeport, Conn., assignor to the Davis & Roesch Temperature Controlling Company, of New Jersey. Filed Nov. 23, 1897. Serial No. 659,568. (No model.)

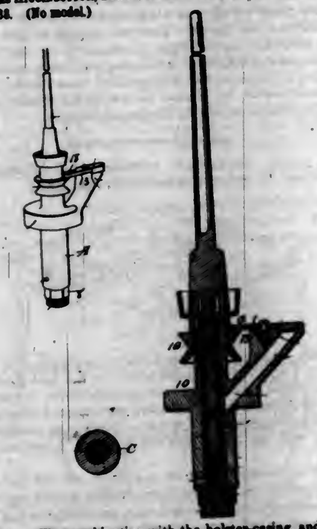
Claim.—1. In a diaphragm-chamber, the combination with an annular diaphragm-seat and diaphragm; of an interior wall or disk adapted to impinge upon the periphery of said diaphragm, above its seat; an exterior inclosing wall located above said disk, secured at intervals to said annular seat; and a central binding-screw having screw-threaded bearings in said exterior wall and adapted, as it is turned downward, to bear against said interior wall or disk, whereby the latter is retained in close contact with said diaphragm, substantially as and for the purpose specified.

2. In a diaphragm-chamber, the combination with an annular diaphragm-seat B and diaphragm C; of an interior wall or disk E, adapted to impinge upon the periphery of said diaphragm above its seat; an exterior inclosing wall A located above said disk E; two or more fastening-pins D located at intervals in the contiguous bearings of said exterior wall A and said diaphragm-seat B, by which said parts are secured together; and a central bearing-screw F having screw-threaded bearings G in said exterior wall, and adapted, as it is turned downward, to bear against said interior wall or disk E, whereby the latter is retained in close contact with said diaphragm, said diaphragm is forced firmly to its seat, and an air-tight chamber is formed between said diaphragm and said inclosing disk E, substantially as and for the purpose specified.

3. In that class of diaphragm chambers in which the diaphragms are actuated by compressed air for operating fluid-controlling valves, the device herein described for actuating the fluid-controlling valve independently of the action of said diaphragm, when the same is relieved from pressure, consisting in the combination with a diaphragm-chamber and the stem of a fluid-controlling valve of an actuating-lever centrally pivoted to a supporting-bracket and connected at one end with the valve-stem of said fluid-controlling valve, and at its opposite end, by an adjusting screw, with the screw-threaded bearings of a stationary supporting-arm, whereby, as said screw is turned forward in its bearings, said lever is swung upon its pivotal support, and said fluid-controlling valve is forced to its seat, substantially as and for the purpose specified.

4. In that class of diaphragm-chambers in which the diaphragms are actuated by compressed air for operating fluid-controlling valves, the device herein described for actuating the fluid-controlling valve independently of the action of said diaphragm, when the same is relieved from pressure, consisting in the combination with a diaphragm-chamber and the stem of a fluid-controlling valve of an actuating-lever; a lever-supporting bracket adjustably attached to said diaphragm-chamber; and an adjusting-screw having screw-threaded bearings in a projecting arm of said bracket, said lever being centrally pivoted to said supporting-bracket and connected at one end with the valve-stem of said fluid-controlling valve, and at its opposite end by said adjusting-screw, with the screw-threaded bearings of a projecting arm from said bracket, whereby, as said screw is turned forward in its bearings, said lever is swung upon its pivotal support, and said fluid-controlling valve is forced to its seat, substantially as and for the purpose specified.

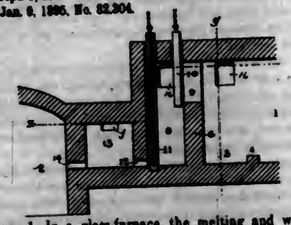
602,109. PROCESS OF MAKING SALTS OF PARAMIDOPHENOL. ISRAEL ROSS, Frankfort-on-the-Main, Germany. Filed June 19, 1895. Serial No. 553,297. (Specimens.) Patented in England June 6, 1895, No. 11,288; in Belgium June 10, 1895, No. 116,014; in Austria June 10, 1895, No. 45/3,966; in France June 11, 1895, No. 248,069, and in Hungary June 14, 1895, No. 4,805.



Claim.—1. Process for the manufacture of primary citrates of alkyl ethers of paramidophenols, which consists in dissolving molecular quantities of citric acid and amidophenol alkyl ether in a suitable solvent, such as alcohol and crystallizing out the salt thus obtained, substantially as described.

2. As new products of manufacture, the primary salts of citric acid with alkyl ethers of paramidophenol composed according to the formula

$$C_6H_8O_7.NH_2C_6H_4O\ alkyl,$$



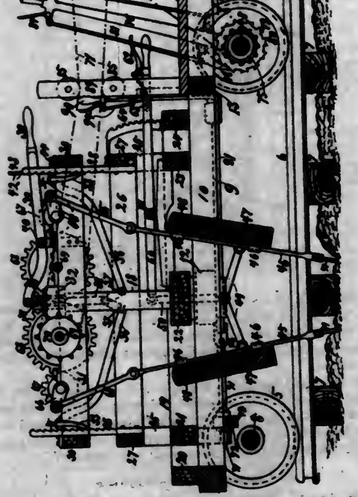
being white crystallizing compounds, melting at 186° to 187° centigrade, easily soluble in water, less soluble in alcohol and almost insoluble in petroleum ether and benzene.

602,110. SPINDLE-BEARING. WILLIAM M. ROSEWORTH and THOMAS HIGGINBOTTOM, Lowell, Mass. Filed Sept. 25, 1897. Serial No. 653,068. (No model.)

Claim.—The combination with the bolster-casing, and a bolster therein, of a screw adapted to turn in the lower end of the casing, a step, a pin in the inner end of the screw for securing the step pivotally therein, the screw entering and concealed by the casing when the step is in position.

602,111. MEANS FOR KEEPING GLASS CLEAR IN REGENERATIVE GLASS-FURNACES. GUSTAV SCHLUDER, Deuben, Germany. Filed Sept. 3, 1895. Serial No. 561,346. (No model.) Patented in Germany Jan. 9, 1895, No. 82,304.

Claim.—1. In a glass-furnace, the melting and working compartments placed at opposite ends of the furnace, combined with the compartments 3 extending from the melting-compartment, the compartment 8 connected with the compartment 3 by the passage 5, and the opening 9 through the dividing-wall, the compartment 13 connected by suitable passages with the working-compartment, the compartment 13 being connected to the compartment 8 by means of the passage 12, and with the working-compartment by the passages 14 and 15, the valve 10 for controlling the passage or opening 9, and the valves 7 and 11 for controlling the passages 5 and 12, the parts being arranged to operate substantially as shown.



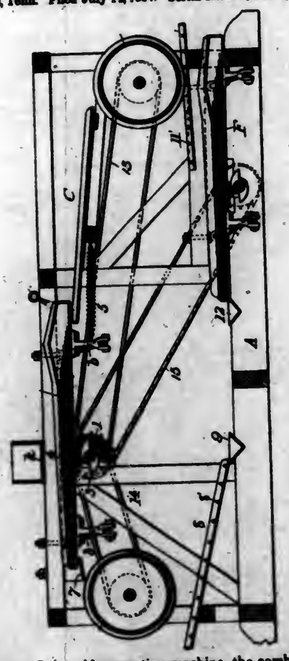
2. A glass-furnace comprising a glass-melting compartment for melting the batch, having a curb extending across the floor of the same, dividing the melting-compartment into two parts, an outlet-channel a little lower than the said curb, a working-compartment and an intermediate compartment between said outlet-channels and working-compartment and suitable connecting-channels extending from one compartment to the other, substantially as described.

3. A plate-glass-melting furnace comprising a melting-compartment and working-compartment, an intermediate compartment, and a discharge-compartment between the said intermediate and working compartments, and valves controlling respectively an adit-channel at one end of the intermediate compartment and a discharge-channel at the other end thereof, substantially as described.

4. A plate-glass-melting furnace comprising a melting-compartment and working-compartment, an intermediate settling-compartment, valve-controlled channels at the bottom and at opposite ends thereof, and a gas or head window having a door or damper to cover the same at the upper part of the dividing-wall between said compartments, substantially as described.

5. A plate-glass-melting furnace comprising a melting-compartment, a working-compartment, an intermediate compartment, valve-controlled channels at opposite ends thereof, a discharge-compartment between the intermediate and working compartments, and plate closed and controlled windows for observation and for working the glass in the said melting intermediate and discharge chambers, substantially as described.

602,112. TAMPING-MACHINE. GUSTAF SHEDEMAN, Washburn, Wis., assignor of one-half to Jacob Anderson, Racine, Wis. Filed Feb. 6, 1897. Serial No. 622,371. (No model.)



Claim.—1. A tamping-machine having an elongated main frame supported on axles and wheels, fitting the railroad-track, a platform secured upon one end of the frame and carrying an engine; a tamper-frame mounted upon the other end of the main frame, said tamper-frame being capable of swinging on its center in the horizontal plane; a tamping mechanism mounted in the tamper-frame and operatively connected with the engine, substantially as and for the purpose set forth.

2. A tamping machine having a main frame moving on wheels on the railway-track; a tamping-frame mounted on the main frame and swinging on its center in the horizontal plane, said tamper-frame having an upper section which is capable of being raised or lowered; a tamping mechanism mounted thereon and operatively connected with an engine mounted on a platform on the main frame, and means for spreading the tamping-bars and swinging the tamper-frame, and for supporting its upper section, substantially as and for the purpose set forth.

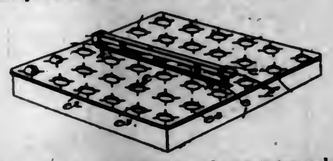
3. A tamping-machine having a main frame moving on wheels, a horizontally-swinging tamping-frame mounted thereon and consisting of a lower and an upper section; the lower section having pivotally-secured swinging planks as 47, with a series of tamping-bars sliding in guides secured on said planks, and the upper frame-section having journaled on it multiple crank-shafts operatively connected with the tamping-bars and having gears by which they receive power from an engine, also mounted on the main frame, said upper frame-section being self-adjustable up and down according to the height of the ground under the tamping-bars, and means for supporting the upper frame-section at various elevations and means for spreading the swinging planks or bars 47, substantially as and for the purpose specified.

602,118. GOLD-SEPARATING MACHINE. BENJAMIN W. SWEET, Knoxville, Tenn. Filed July 14, 1897. Serial No. 644,541. (No model.)

Claim.—1. In a gold-separating machine, the combination with a feed-trough, an inclined concentrating-table, and means for operating the same, of amalgamating-surfaces at each end of said table for receiving the heavier and lighter grades respectively, substantially as described.

2. In a gold-separating machine, the combination with a feed-trough, a concentrating-table, and means for operating the same, of an amalgamating-plate and an amalgamating-roll stationed in series at the head end of said table, and an amalgamating-roll stationed at the tail end of said table, substantially as described.

602,114. COMBINATION-LOCK. LEWIS C. THOMPSON, Indianapolis, Ind. Filed June 21, 1897. Serial No. 641,536. (No model.)



Claim.—1. In a permutation-lock, a bolt actuated by a stud-pin, a stud-pin accessible from the outside of the lock and arrested in its movement by tumblers, a pair of movable tumbler-plates having slots which register with each other at certain positions of the plates to allow the stud-pin to pass into them, thereby permitting the maximum stroke of the stud-pin, a pair of knobs on the outside of the case mounted on separate spindles, said knobs having index-rings and means consisting of cranks or cams on the inner ends of their spindles for independently moving the tumbler-plates, as and for the purposes specified.

2. A bolt actuated by a stud-pin, a stud-pin accessible from the outside of the lock and checked in its movement by tumblers, a pair of tumbler-plates moving about a common center and having slots which register with each other at certain positions of the plates to allow the stud-pin to pass into them thereby permitting the maximum movement of the said pin and means for moving the tumbler-plates from the outside of the lock-case, into an ascertained position consisting of a pair of spindles, one for each tumbler-plate, having outside knobs and crank or cam connections between the inner end of each spindle and its respective plate, all substantially as described.

3. In a permutation-lock, a pair of tumbler-plates moving about a common pivotal point and having a series of notches in the periphery of the plates, spindles having knobs on the outside of the case, said spindles being connected with the tumbler-plates by means substantially as described whereby rotary movement of the knobs will impart reciprocating movement to the plates.

4. A bolt actuated by a stud-pin, a stud-pin accessible from the outside of the lock and checked in its movement by tumblers, a pair of tumbler-plates having slots which register with each other at certain positions of the plates to allow the stud-pin to pass into them thereby permitting the maximum movement of the said pin, a pair of knobs on the outside of the case having index-rings said knobs and rings being mounted on revoluble spindles, cams adjustably secured to the inner ends of the spindles for moving the tumbler-plates substantially as described and for the purposes specified.

602,115. EGG-TESTER. IRVING S. VERMES, Schenectady, N. Y. Filed Sept. 10, 1897. Serial No. 651,203. (No model.)

Claim.—1. An egg-carrying frame for egg-testers and the like, comprising a rigid rim of a depth somewhat less than the length of an egg, a double thickness of cloth stretched over the top of said rim, said thicknesses having registering apertures and non-registering slits radiating therefrom, and movable egg-supports attached to the bottom of said rim in line with said apertures, substantially as described.

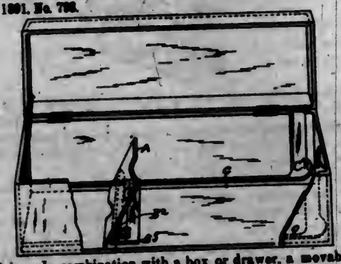
2. An egg-carrying frame for egg-testers and the like comprising a body portion, rods pivoted upon said body portion, egg-supporters upon said rods, loops upon said rods, and a plate having reciprocation secured to said loops; substantially as described.

3. An egg-carrying frame for egg-testers and the like comprising a body portion, rods pivoted upon said body portion, egg-supporters upon said rods, loops upon said rods, and a plate having reciprocation, said plate being provided with slots in which the loops rest; substantially as described.

4. An egg-carrying frame for egg-testers and the like, comprising a body portion, egg-supporting members upon said body portion, said members being movable into and out of supporting position, members provided with eyes upon said body portion, a handle-bar slidable in said eyes, and connections between the handle-bar and the supporting members for operating the latter from the former; substantially as described.

5. An egg-carrying frame for egg-testers and the like, comprising a rim, a pair of cross-strips secured to said rim, said cross-strips being spaced apart, egg supporters upon the body portion of the frame, strips having their upper portions formed into eyes and their lower portions secured between the cross-strips, and a handle-bar in said eyes; substantially as described.

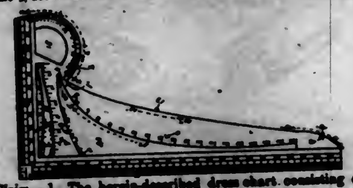
6. An egg-carrying frame for egg-testers and the like, comprising a rim, a pair of cross-strips secured to and within said rim; said said cross-strips being spaced apart, egg-supporters upon the body portion of the frame, said supporters being movable into and out of supporting position, a plate slidable lengthwise between said cross-strips, said plate being in connection with the egg-supporters whereby its movement serves to carry said supporters into and out of supporting position, arms secured to said plate, and a longitudinally-slidable handle-bar connected to said arms; substantially as described.



7. An egg-carrying frame for egg-testers and the like, comprising a rim, a pair of cross-strips secured upon and within said rim, said strips being spaced apart, egg-supporters upon the body portion of the frame, said supporters having movement into and out of supporting position, strips having their upper ends formed into eyes while their lower ends are secured between the cross-strips, a handle-bar longitudinally slidable in said eyes, arms depending from said handle-bar and entering between the cross-strips, a plate slidable lengthwise between said cross-strips secured to the arms, and connections between the plate and the egg-supporters whereby in the movement of the handle-bar the egg-supporters are carried into or out of supporting position; substantially as described.

8. In an egg-carrying frame for egg-testers or the like, a rim, a plate having sliding movement within the walls of the rim, a rod pivoted upon a wall of the rim, egg-supporters upon said rod, a loop upon said rod, and a link having pivotal connection with the plate and the loop; substantially as described.

9. An egg-supporting frame for egg-testers and the like comprising a body portion, egg-supporters upon said body portion, said supporters being movable into and out of supporting position, a handle-bar, connections between the handle-bar and the egg-supporters, said handle-bar being movable to operate the egg-supporters as aforesaid, a shoulder upon said handle-bar, and a spring upon the body portion of the frame and resting against the shoulder whereby accidental movement of the egg-supporters is prevented; substantially as described.



10. An egg-supporting frame for egg-testers and the like comprising a body portion, egg-supporters upon said body portion, said supporters being movable into and out of supporting position, a handle-bar, connections between the handle-bar and the egg-supporters, said handle-bar being movable to operate the egg-supporters as aforesaid, a shoulder upon said handle-bar, a spring upon the body portion of the frame and resting against the shoulder whereby accidental movement of the egg-supporters is prevented, and a push-pin through the handle-bar to release the spring from engagement with the shoulder; substantially as described.

602,116. APPARATUS FOR KEEPING LETTERS OR OTHER DOCUMENTS. THOMAS B. VERMOR, Wallington, England. Filed May 21, 1896. Serial No. 676,035. (No model.) Patented in England Jan. 15, 1891, No. 793.

Claim.—In combination with a box or drawer, a movable support, permanently inclined, guides therefor, and a hinged guiding-piece B^3 extending from the rear of the movable support, substantially as described.

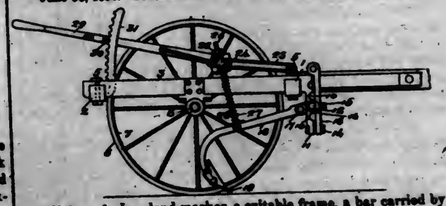
602,117. DRESS-CHART. IDA WILLIAMS, Wichita, Kans. Filed June 1, 1897. Serial No. 639,042. (No model.)

Claim.—1. The herein-described dress chart, consisting of the combination of a square, a back and front neck curve, a back-neck scale, a front-neck scale the divisions being unequal in length on said neck-curve, a convex and concave brass leading from said neck-curve to the end of the long arm of said square, said convex curve having a back-curve scale, the inner end of the short arm of said square being convex forming the front-shoulder curve, and having a front-shoulder scale, a double concave arm connecting the neck-curve to the long arm of said square, the upper concave curve of said arm having a back-shoulder scale, and the lower concave curve for the back arm-scye.

2. The herein-described dress-chart, consisting of the combination of a square having arms of unequal length, the inner edge of the shorter of said arms being convex, and provided with a front-shoulder scale, a back and front neck curve, a back-neck scale, and a front-neck scale with the divisions unequal in length on said neck-curve, a concave and convex arm joining said neck-curve to the long arm of said square, said convex side having a back-curve scale, said concave side terminating at said neck-curve on an angle, a double concave arm nearly parallel to the short arm of said square, one of the concave curves having a back-shoulder scale.

602,118. STOVE. FRANK C. WILSON, Aurora, Ill. Filed Aug 24, 1896. Renewed Mar. 5, 1898. Serial No. 672,777. (No model.)

Claim.—1. The combination with a stove, of an air-feed flue tapering toward its inner end, such flue entering the stove above and terminating directly over the fire-pot, and having an annular discharge-aperture directed downwardly and outwardly.



2. The combination in a stove, of an air-feed flue entering the stove above and terminating directly over the fire-pot, and having an annular discharge-aperture directed downwardly and outwardly.

3. The combination in a stove, of a fire-pot and an air-flue entering the combustion-chamber from above and terminating at the top of the fire-pot and upon the vertical axis thereof, with a conical deflector centrally entering the mouth of the flue but spaced apart from its walls to form an annular discharge-port.

4. The combination with a stove, of an air-feed flue tapering toward its inner end, such flue entering through the top of the stove and terminating approximately at the top of the fire-pot, a conical deflector having its apex located within the inner end of the flue, whereby a downwardly and outwardly directed annular discharge-aperture is formed.

5. The combination with a stove having a fire-pot, of an air-feed flue entering the combustion-chamber and having an annular discharge-aperture directed downwardly and outwardly from the center of the chamber and above the fire-pot.

602,119. LAND-MARKER. JOHN H. WINTER, Brooks, Ill. Filed June 30, 1897. Serial No. 642,965. (No model.)

Claim.—1. In a land-marker, a suitable frame, a bar carried by the frame at the forward end thereof, arms having pivotal ends connected to said bar, means for adjusting the bar in a vertical plane, shovels carried by the free ends of said arms and occupying a post-

tion substantially under the axle of the frame, and suitable springs for pressing the shovels against the ground, substantially as set forth.

2. In a land-marker, a suitable frame, a bar carried by the frame, arms having pivotal ends adapted to slide along said bar, means for adjusting said bar in a vertical plane, shovels carried by the free ends of said arms and occupying a position under the axle of the machine, and suitable springs for pressing the shovels against the ground, substantially as set forth.

3. In a land-marker, a suitable frame comprising front and rear members, side members adjustable along said front and rear members, a bar carried at the front end of the frame, rings slidingly mounted on said bar, arms pivoted to said rings, deflected arms having alining recesses or notches for receiving the opposite ends of the bar whereby the latter can be adjusted vertically, means for clamping said bar in position, levers pivoted along the front member, a bar carried by said levers, guide-rods extending from said last bar and connecting with the pivoted arms, springs encircling the guide-rods and interposed between the pivoted arms and the bar carried by the pivoted levers, shovels carried at the free ends of the pivoted arms, operating-levers for the shovel carrying bar, a spring-actuated pawl carried by each lever, and a rack-bar for the pawls, the parts operating substantially as and for the purpose set forth.

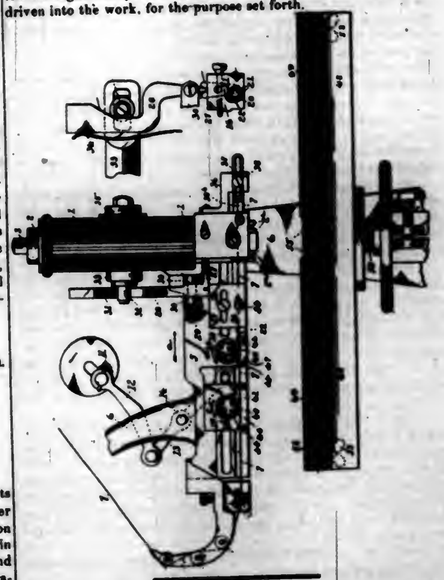
602,120. NUT-LOCK. ALBERT S. WRIGHT, Battle Creek, Mich. Filed July 14, 1897. Serial No. 644,543. (No model.)

Claim.—I. In a nut-lock, the nut provided on one side of its screw-threaded bore with a perforation angular in form at its inner end and round and screw-threaded at its outer end, in combination with a block or die roughened on its inner face and conformieg in shape in transverse section to the inner end of said perforation, and a screw adjustable in the outer screw-threaded end of said perforation, said screw being connected with the outer end of said block or die for moving it into and out of engagement with the bolt, substantially as described.

2. The combination with a nut provided with a perforation extending at right angles to its screw-threaded bore, said perforation being angular or polygonal in form at its inner end adjacent to said bore, and rounded or screw-threaded at its outer end, of a block or die movable in said angular end and held against rotation thereby, and having a threaded inner face for engaging the threads of the screw-bolt, and a screw coupled to said block or die and adjustable in the outer end of said perforation for moving said block into and out of engagement with the bolt, substantially as described.

3. The combination with a nut having a perforation extending laterally from its bore and screw-threaded at its outer end, of a set-screw engaging said perforation, and a non-rotatable block connected with the inner end of said screw and having a screw-threaded inner face, substantially as described.

602,121. STAPLING-MACHINE. FRANK S. BRADLEY, New Haven, Conn. Filed May 21, 1897. Serial No. 637,622. (No model.)



Claim.—1. In a staple-stitching machine, the combination with the stitching mechanism, of a separable work-supporting table comprising a base and a removable upper portion, said removable portion carrying the necessary clenchers and means whereby it is readily attached and detached from the lower portion or base, for the purpose set forth.

2. In a staple-stitching machine, a separable work-supporting table comprising a base having inclined sides and a flat top, a V shaped block carrying the necessary clenchers adapted to be removably attached to said base, for the purpose set forth.

3. In the wire feeding and controlling mechanism of a staple-stitching machine, the combination with a wire-supporting bed, of an eccentrically-supported disk, a tension-spring therefor, a serrated-faced ring operatively mounted thereon, said ring adapted to turn on its support and permit the wire to move freely in one direction and to firmly engage the wire to prevent its movement in the opposite direction, for the purpose set forth.

4. In a staple-stitching machine, the combination with the wire-feeding mechanism of a cutter-box adapted to have a longitudinal adjustment, a wire-guide mounted in said cutter-box, said guide having longitudinal grooves in its periphery for the wire and a shell to encircle such grooves, a cutter and means for operating said cutter, for severing the wire, substantially as set forth.

5. In a staple-stitching machine, the combination, with the wire-feeding and staple-forming mechanism, of a deflector having an inclined surface to engage that portion of the wire fed beyond the forming-bar, which portion forms one of the legs of the staple, and impart a forward set thereto so as to overcome its tendency to follow its angular-shaped end, produced by the cutting-off tool, when driven into the work, for the purpose set forth.

602,122. LANTERN-BRACKET. JOHN W. BRAGGER, Watertown, N. Y., assignor to the Hitchcock Lamp Company, same place. Filed Oct. 18, 1897. Serial No. 655,621. (No model.)

Claim.—1. In an attachment for a bicycle-lamp, the jaws, one of which is provided with notches in its free end, and a link which is applied to these notches, and adapted to freely turn upon them, the link being combined with means for clamping the jaws, substantially as set forth.

2. In a device for securing bicycle-lamps in position, the pivoted jaws recessed as shown, the link placed over the free ends thereof, the lugs on the inner longitudinal edges of the link, and the tightening-screw, as set forth.

3. The jaws, one of which is provided with notches in its edge, and the link having one of its ends curved, and provided with internal stops, the link being combined with means for clamping the jaws, substantially as shown.

602,123. RIM-JOINT FOR VEHICLE-WHEELS. FRANCIS I. BRANDON and AMOS ROOP, Hicksville, Ohio. Filed Feb. 12, 1897. Serial No. 623,155. (No model.)

Claim.—1. In a joint for wooden rims, a section having a pin and tenons at the sides of the said pin, and a matching section having a socket to receive and wholly inclose the pin, and formed with grooves at the sides of the socket to receive the aforesaid tenons, substantially as and for the purpose described

2. In a joint for wooden rims, a section having a central pin, and a series of segmental tenons concentric with the pin and tapering longitudinally throughout their length, the outer ends being the smaller, and a matching section having a central socket, and a series of segmental grooves concentric with the socket and of a corresponding taper to the tenons of the first-mentioned section so as to snugly receive them, substantially as set forth for the purpose described.

3. In a joint for wooden vehicle-rims, a section having a centrally-disposed pin and a series of tenons at the sides of and concentric with the pin and extending from the inner to the outer edges of the rim, and a matching section having a socket to receive and wholly inclose the pin, and having a series of grooves at the sides of and concentric with the socket and extending through the inner and the outer edges of the rim and snugly receiving the tenons of the first-mentioned section, substantially as specified.

602,124. BUTTER CAKE AND MEANS FOR MAKING SAME. FRANK BURGER and HENRY M. WILLIAMS, Fort Wayne, Ind.; said Burger assignor of one-half of his right to said Williams. Filed Aug. 17, 1897. Serial No. 648,596. (No specimens.)

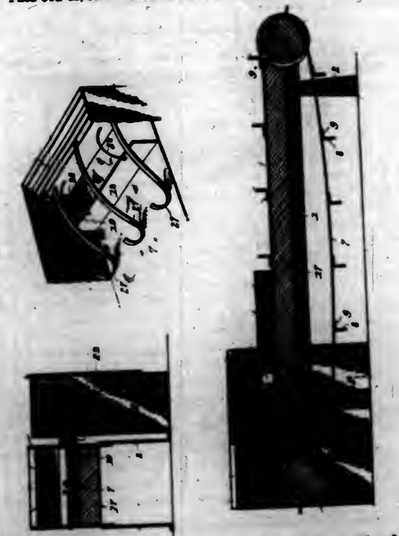
Claim.—1. As a new article of manufacture, a butter cake consisting of a lump of butter having a recess at the top for the purpose of receiving ice and a central opening to permit the escape of the melted water.

2. As a new article of manufacture, a butter cake consisting of a lump of butter having a recess at the top for the purpose of receiving ice, a central opening to permit the escape of the melted water, and a corrugated bottom surface.

3. A mold comprising three parts hinged together at one side and having handles, the central portion provided with a central opening, the upper portion provided with a convex projection and pin, and the lower portion provided with a central opening to receive the pin, substantially as described.

4. A mold comprising three parts hinged together at one side and having handles, the central portion provided with a central opening, the upper portion provided with a convex projection and pin, and the lower portion provided with a central opening to receive the pin and projections E extending from the side above the central portion, substantially as described.

602,125. BATH-TUB SEAT. WILLIAM BURROWS, Brooklyn, N. Y. Filed Dec. 9, 1897. Serial No. 661,213. (No model.)



Claim.—1. In a seat for bath-tubs the combination of the seat proper, the same being lengthwise adjustable, and two or more hangers adapted to be suspended from the rim of the tub and provided with cross-pieces to which the said seat proper is detachably secured.

2. In a seat for bath-tubs the combination of the lengthwise-adjustable seat proper, and a plurality of hangers suspended from the rim of the tub, to which the said seat is detachably secured; said hangers being provided with cushions of elastic material at the points of contact with the tub.

3. In a seat for bath-tubs the combination of the seat proper composed of a solid piece of material and provided with laterally-adjustable rods bearing hooks on their outer ends, and a plurality of hangers suspended from the rim of the tub to which the said seat proper is attached by means of said hooks.

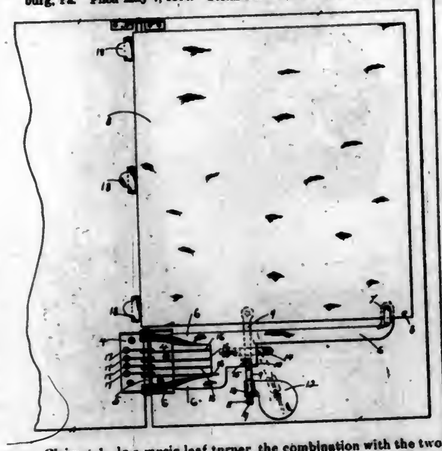
602,126. FLY-TRAP. TRAMMOND CLEMENT, Thibodeaux, La. Filed Oct. 12, 1897. Serial No. 654,957. (No model.)

Claim.—1. In a fly-trap, the combination of a supporting-frame, a casing provided with an extension having a transparent top wall, an endless carrier having one of its flights passing beneath the casing, said endless carrier being provided at intervals with flexible transverse strips, and a yieldingly-mounted brush or scraper arranged within the casing and adapted to remove flies from the carrier, substantially as and for the purpose described.

2. In a fly-trap, the combination of a casing having a transparent portion, an endless carrier having one of its flights passing beneath the transverse portion of the casing, said endless carrier being provided at intervals with flexible transverse strips, and a transverse roll loosely resting upon the upper face of the upper flight of the endless carrier to remove flies from the same, substantially as described.

3. In a fly-trap, the combination of a frame or support, an endless carrier mounted thereon, a superimposed casing arranged over a portion of the endless carrier, spring-arms mounted within the casing, and a brush or scraper-blade hinged to the spring arms and engaging the endless carrier, substantially as and for the purpose described.

4. In a fly-trap, the combination of a frame or support, an endless carrier, a casing located above the portion of the endless carrier, rolls located above and below the endless carrier and engaging the same, the upper roll being capable of a limited vertical movement, and a movable top or plate arranged within the casing and resting upon the upper roll, substantially as described.



5. In a fly-trap, the combination of a frame or support, an endless carrier, a casing located over a portion of the endless carrier, rolls located above and below the endless carrier and arranged at the back of the casing, the upper roll being capable of a limited vertical movement, a movable top or plate arranged within the casing, supported at its front edge by the same and having its rear portion resting upon the upper roll, and spring-fingers extending upward from the rear portion of the top or plate and engaging the adjacent wall of the casing, substantially as described.

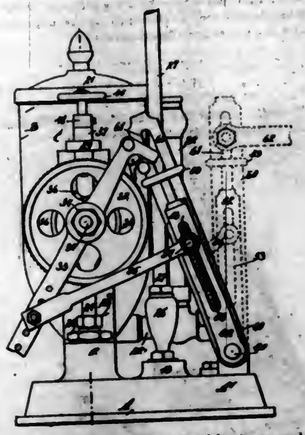
6. In a fly-trap, the combination of a frame or support, an endless carrier, a casing disposed over a portion of the same, upper and lower rolls engaging the endless carrier at the back of the casing, and curved springs mounted within the casing and engaging the endless carrier in advance of the rolls, substantially as described.

7. In a fly-trap, the combination of a casing, an endless carrier arranged beneath the same and provided with flexible transverse strips, upper and lower rolls engaging the carrier at the back of the casing, springs extending from the casing and engaging the carrier in advance of the rolls, and a yieldingly-mounted brush or scraper arranged within the casing, substantially as described.

8. In a fly-trap, the combination of an endless carrier, a casing disposed over a portion of the same, a cage communicating with the casing, upper and lower rolls engaging the endless carrier at the back of the casing, the upper roll being capable of a limited vertical movement, a top or plate loosely resting upon the upper roll and moving with the same, springs engaging the endless carrier in advance of the rolls, and a yieldingly-mounted scraper or brush arranged within the casing adjacent to the communication between the same and the cage, substantially as described.

602,127. SHEET-MUSIC TURNER. CHARLES A. CORP, Wilkinsburg, Pa. Filed May 7, 1897. Serial No. 635,490. (No model.)

Claim.—1. In a music-leaf turner, the combination with the two sections, the hinges at the upper and lower ends connecting them together, the arms pivoted on the pintle of said lower hinge, formed with a notch in the lower edge and provided with a clip at the outer end, and the springs for actuating said arms, of the spring-trigger pivoted to one of said sections, the hook intermediate the ends and the strap secured to said sections for limiting the movement of the trigger, substantially as described.



2. In a music-leaf turner, the combination with the two sections, the hinges at the upper and lower ends connecting them together, the series of arms pivoted to the pintle of the lower hinge, formed with a notch in the lower edge and provided with a clip at the outer end and the springs for actuating said arms, of the trigger pivoted to one of said sections, the hook intermediate its ends, the pin near the lower end, the finger-piece loosely mounted on said trigger, and having a slot or notch in one edge which engages with said pin and the strap for limiting the movement of the trigger, substantially as described.

602,128. AUTOMATIC LUBRICATOR. ALEXANDER A. DE WITT, New York, N. Y. Filed June 2, 1897. Serial No. 638,134. (No model.)

Claim.—1. A lubricator, comprising a pump, the rod whereof has two tappets or striking-points thereon, one of which is movable relative to the other, an actuating-cam revolving between the striking-points and a threaded rod mounted longitudinally upon the piston-rod and engaging the adjustable striking-point to move it.

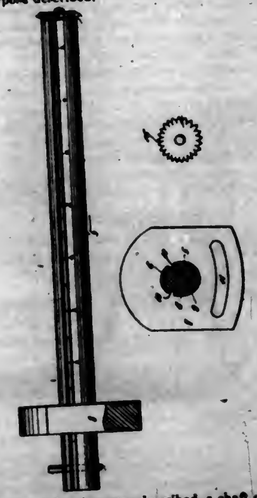
2. In a lubricator, a pump the piston whereof consists of a rod, a ring-body and a neck, the body of the piston having a fixed lower striking-point, an upper striking-point, adjustable to and from the fixed striking-point, an adjusting-screw located in the neck and controlling the movement of the adjustable striking-point, a winged cam held to revolve in the ring-body and arranged for engagement with the two striking-points, and means for imparting rotary movement to the cam, as specified.

3. In a lubricator, the combination, with a pump and its piston, the piston consisting of a rod, a ring-body and a neck, the ring-body being provided with a fixed striking-point and a second striking-point adjustable to and from the fixed striking-point, and an adjusting-screw having a right and a left hand thread, one thread engaging with a corresponding thread in the neck of the piston and the other thread entering the adjustable striking-point, of a winged cam held to revolve in the ring-body of the piston, the cam being arranged for engagement with the two striking-points, an actuating device for the cam, a regulating device controlling the actuating mechanism, a motor, and means for operating the regulating device from said motor.

4. In a lubricator, the combination, with a pump and its piston, the piston comprising a rod, a ring-body and a neck, the body being provided with a fixed striking-point and an adjustable striking-point, and a winged cam held to revolve within the ring-body between the two striking-points, of a ratchet connected with said cam, an arm carrying a dog, arranged to move the said ratchet, a regulating-arm, an arm connecting with the ratchet-arm and adjustably connected with the regulating-arm, a shaft carrying the regulating-arm, and an operating-arm arranged for connection with a motor, attached to the said shaft, for the purpose specified.

5. In a lubricator, the combination, with a pump and its piston, the piston consisting of a rod, a ring-body and a neck, the ring-body being provided with a fixed striking-point and a movable striking-point, an adjusting-screw held to turn in the neck, having a right and left hand thread, one of the threaded surfaces engaging with the adjustable point, and a winged cam held to revolve between the striking-points of the piston, of a ratchet-wheel connected with the cam, an arm provided with a dog, engaging with the teeth of the ratchet-wheel connected with the cam, a shaft, a regulating-arm connected with the said shaft, and a connecting-rod adjustably attached to the arm carrying the dog and to the regulating-arm, an operating-arm connected with the said shaft, and means, substantially as described, for effecting an adjustable connection between the operating-arm and a motor, for the purpose set forth.

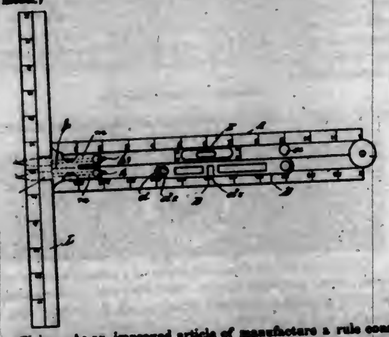
602,129. SEAL. THOMAS H. FREES, Cincinnati, Ohio, assignor of one-third to Richard H. Clawson, same place. Filed June 10, 1897. Serial No. 640,156. (No model.)



Claim.—The combination with a hasp and staple of the wire rod having a head at one end and formed with corrugations adjacent thereto and the lead disk through which said rod is passed and engaging with said corrugations and said rod passed through the staple and its end coiled around the rod near the disk, substantially as described.

602,130. CARPENTER'S TOOL. BERT FULLER, Sacramento, Cal. Filed Feb. 24, 1897. Serial No. 624,526. (No model.)

Claim.—1. In a rule, a shaft oval in form in cross-section and provided with grooves adjacent to one edge thereof, and with a scale in either of said grooves, substantially as and for the purpose described.



2. In a rule of the character described, a shaft oval in form in cross-section, and provided with grooves adjacent to one edge thereof and with a scale in either of said grooves, a sliding block mounted upon said shaft and provided with an opening which corresponds in shape with a cross-section of said shaft, segmental plates secured to said block and adapted to act as bearing-surfaces, substantially as and for the purpose described.

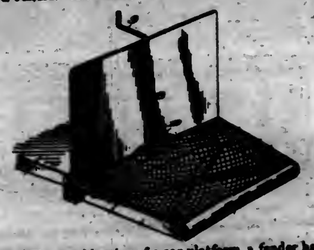
3. In a rule of the character described, a shaft oval in form in cross-section, and provided with grooves adjacent to one edge thereof and with a scale in either of said grooves, a sliding block mounted upon said shaft and provided with an opening which corresponds in shape with a cross-section of said shaft, segmental plates secured to said block and adapted to act as bearing-surfaces, and a tracing-wheel mounted centrally of one end of said rule, said wheel being divided on the perimeter thereof by lines which cross each other, and the sections between said lines being sharpened, substantially as and for the purpose described.

4. A combined ruler and scriber, comprising a shaft, oval in form in cross-section, and provided with two longitudinal grooves, and with a scale in either of said grooves, a beveled wheel having serrated edges mounted on one end of said shaft, a pin mounted adjacent to the opposite end, and a sliding block having a central opening corresponding in shape to a cross-section of said shaft, and also provided with tongues adapted to engage said grooves, substantially as and for the purpose described.

602,131. RULE AND MEASURING-STICK. ALBERT W. SOUTLOCK, Brooklyn, N. Y. Filed Feb. 26, 1896. Serial No. 581,114. (No model.)

Claim.—As an improved article of manufacture a rule consisting of two parts which are hinged together, one of said parts being provided with an arm which is pivotally connected therewith and which is provided at the free end thereof with a hook, said hook being adapted to engage with a pin or projection formed on the said other part when the said parts are at a predetermined angle, said arm being provided centrally with a notch or recess, and the said other part being provided with a leg or projection which is adapted to engage said recess when said parts are held at a second predetermined angle, one of said parts being provided with a spirit-level, and each of said parts being provided at the free end thereof with apertures, each of which is provided with a longitudinal slot, a set-screw mounted at the inner end of each, steel points mounted in said apertures, and a pencil-holder provided with a pencil mounted on one of said points, said pencil-holder consisting of a tube adapted to engage one of said points and a supplemental tube secured thereto and adapted to hold a pencil, a T-square attachment mounted transversely of the outer end of said rule, the same being provided with a side wing having openings at the outer end thereof and said set-screws being adapted to engage said openings and also said points, substantially as and for the purpose described.

602,182. ARMOR FOR PNEUMATIC TIRES. ROBERT C. HANSELL, San Antonio, Tex. Filed Aug. 13, 1897. Serial No. 648,129. (No model.)

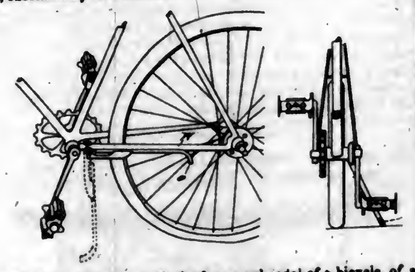


Claim.—1. The combination with a tire, of a puncture-proof armor comprising a plurality of transverse series of overlapping plates or scales, each pair of adjacent series of plates being composed of plates or scales of unequal number and each series of scales or plates connected flexibly together by hinge-joints which lie in the direction of the length of the tire, the hinge-joints of each series of plates being out of line with the corresponding joints of the scales on opposite sides thereof, substantially as described.

2. The combination with a tire, of a puncture-proof armor therefor comprising a plurality of transverse series of plates of unequal number, the alternate series consisting of a number of plates hinged together at their adjacent edges, and the intermediate series consisting of other plates hinged together and arranged to lap the alternate series of plates lengthwise of the tire; all the joints of the plates extending in the direction of the length of the tire, and the hinges of contiguous series of plates being out of line with each other, for the purposes described, substantially as set forth.

3. A flexible armor for inflatable tires comprising transverse series of plates arranged to lap at their adjacent ends and provided with slitted ears, the adjacent plates of each series being united by headed pintles which fit loosely in the slitted ears, as and for the purposes described.

4. A flexible armor for inflatable tires comprising the plates or scales, each pair of scales being provided on their contiguous edges with ears, and the coupling-pins arranged with their longitudinal axes at right angles to the length of said scales and having their headed ends loosely connected to the ears of the adjacent pairs of scales, substantially as described.

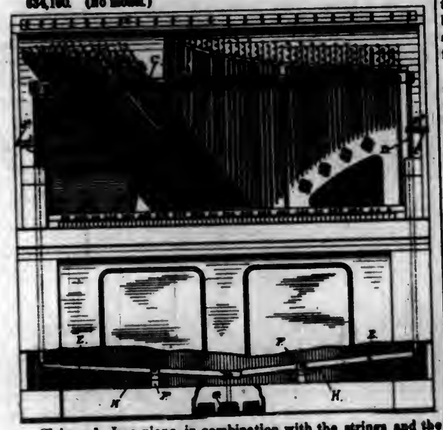


602,183. CAR-FENDER. FREDERIC A. HAINES, ANDREW M CUPPLES, and MICHAEL MCCANN, Tyrone, Pa. Filed June 26, 1897. Serial No. 642,462. (No model.)

Claim.—The combination of a car-platform, a fender having flaring sides hinged thereto, a roller carried between the front end of said sides, a netting secured to and depending from said sides, a lever attached to said frame provided with a handle adapted to extend over the dashboard of the platform when the fender is raised, and a spring-actuated catch adapted to encircle said lever and hold said fender in its raised position, substantially as described.

602,184. BICYCLE-REST. FRANK F. HAWES, Westfield, Mass., assignor of two-thirds to Edwin J. Smith and Clarence K. Prince, same place. Filed Feb. 11, 1896. Serial No. 578,882. (No model.)

Claim.—1. The combination with the frame of a bicycle, of a clamp piece embracing said frame near the pedal, and a leg having jointed connection to said clamp-piece, in position to be engaged by the pedal when swung away from contact with the frame, and means for retaining the leg folded against the frame, or in extended position, substantially as described.

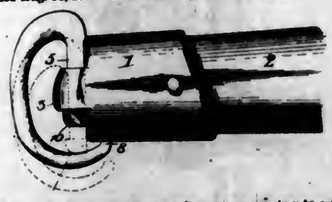


2. The combination with the frame and pedal of a bicycle, of a supporting-rest connected to the frame and having a joint which may be folded in one direction only, means for holding the rest in folded or in extended position, said rest connected to the frame in position when extended to be struck by the moving pedal and folded back against the frame, and to be passed by the pedal when closed, all substantially as described.

3. The combination with the frame and pedal of a bicycle, of a rest connected to said frame, said rest having a joint which may be folded in one direction only, means for holding said rest folded against the frame or extended to act as a support, said rest attached in position to be struck and turned back from its extended to its folded position by the movement of the pedal, said rest also provided with a foot-piece by which it may be turned out by the foot of the rider without dismounting, whereby the support may be turned either out or in without dismounting, all substantially as described.

4. In a bicycle-support, the combination with a movable supporting-leg, of mechanism actuated by the movement of the drive-sprocket which is adapted to engage with the leg and raise the latter out of supporting position.

602,185. TONE-MODIFYING ATTACHMENT FOR PIANOS. JOHN C. KIDD, San Francisco, Cal. Filed Apr. 27, 1897. Serial No. 634,160. (No model.)



Claim.—1. In a piano, in combination with the strings and the action of the piano, an elastic diaphragm interposed between the hammers of the action and the strings but normally out of contact with both and having strikers or contacts on the face next to the strings and in line with the striking-face of the hammers, the said diaphragm being confined at the top and bottom edges or longer sides.

2. In a piano, in combination with the strings and the action of the piano, a skeleton bar or frame having a rectangular opening, or openings, an elastic diaphragm fixed over said opening or openings, means for moving said frame into and out of working position between the hammers and the strings to receive the blows of the hammers on the front face of the diaphragm when in working position and to stand out of the path of the hammers when not in operation, and strikers or contacts on the opposite face of the diaphragm in line with the hammers, as specified.

3. The combination of the skeleton frame having an opening or openings extending the full length of the pianoforte-action to take in the hammers, an elastic diaphragm stretched across said opening and strikers or contacts on the back face of said diaphragm at intervals of distance apart, the diaphragm being perforated or partially separated between said strikers, as specified.

4. The combination with the skeleton frame having an opening or openings, an elastic diaphragm stretched across said opening or openings, strikers or contacts on the back face of said diaphragm at intervals of distance apart, the said diaphragm being partially separated between the said strikers, and means for moving said frame into and out of working position with respect to the strings and the hammers of a piano, as described consisting of the rods D D, levers E E, pedal G and springs H, substantially as specified.

602,186. WHIFFLETREE-HOOK. PIUS R. LACK, Paducah, Ky. Filed Aug. 31, 1897. Serial No. 650,164. (No model.)

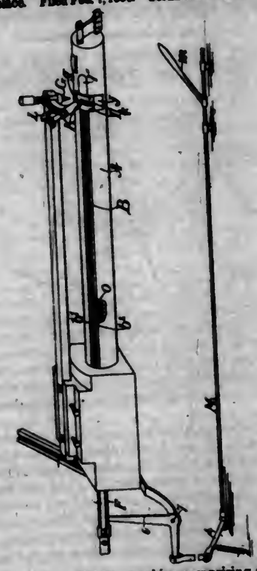
Claim.—1. In means for securing a trace or tug to a whiffletree or the like, the combination of a ferrule having a cross-bar at its outer end, and a hook having its shank slidably mounted in the space formed between the said cross-bar and terminal of the ferrule and having its extremity headed to engage with the rear side of the cross-bar and limit the forward movement of the hook, and having its bill portion extending beyond the said cross-bar and carving in the rear of the headed end of the shank and engaging with the rear side of the ferrule, substantially as shown for the purpose specified.

2. In means for securing a trace or tug to a whiffletree or the like, the combination of a ferrule provided at its outer end with the cross-bar, and a hook having its shank portion slidably mounted in the space formed between the cross-bar and outer end of the ferrule and headed to engage with the rear side of the cross-bar, and having its bill portion exterior to the cross-bar and carving around it and the headed end of the shank and having the extremity of the bill bent and adapted to enter a depression in the rear side of the ferrule so as to make positive engagement therewith, substantially as set forth.

3. In combination, a ferrule having a cross-bar at its outer end midway between its front and rear sides and having a depression in its rear side a short distance from its outer end and having a notch forward of the cross-bar, and a hook having its shank portion slidably mounted in the space formed between the cross-bar and outer end of the ferrule and having its inner end headed to engage with the rear side of the cross-bar and its front end normally fitted in the said notch, and having its bill carving around the cross-bar and the headed end of the shank and bent to make positive engagement with the recess in the rear side of the ferrule, substantially as and for the purpose specified.

602,187. LEVEL. JOHN LEWTON and JOHN DUNCKER, Homer, Mich. Filed Nov. 23, 1896. Serial No. 613,100. (No model.)

Claim.—In a level, the combination of a suitable block A having straight edge; a receptacle supported within said block consisting of oppositely-situated transparent sides; a ring E, between the same, with gaskets F at each side; rings C, C, to each side of the same having marked thereon a suitable scale retained and clamped upon the glass by suitable screws *n*, and supporting rings B, B, let into each side of the block to engage the central receptacle and hold it in a fixed position, all coacting together substantially as described for the purpose specified.



602,188. END-GATE. SAMFORD D. METCALFE, Brooton, Ill. Filed Aug. 28, 1897. Serial No. 649,851. (No model.)

Claim.—1. The combination of a wagon-body provided at its bottom with a transverse cleat projecting laterally from it, stops mounted on the body in advance of the projecting ends of the cleat, an end-gate having a hinged section and provided with side pieces or wings having their lower ends interposed between the projecting portions of the cleat and the stops, a lever provided with a longitudinal slot, a link connecting one end of the lever with the adjacent side of the end-gate, a pivot mounted on the wagon-body and passing through the slot of the lever, and a catch or stop mounted on the end-gate and arranged to be engaged by the other end of the lever, substantially as described.

2. The combination of a wagon-body provided at its bottom with a transverse cleat projecting laterally from it, an end-gate having a lower hinged section and provided with side pieces or wings having their lower ends arranged in advance of the ends of the cleat, the lower hinged section being supported directly upon said cleat, stops mounted on the wagon-body and located in advance of the lower ends of the side pieces or wings to prevent the end-gate from slipping forward when the lower hinged section is unfastened, a pivot mounted on the wagon-body, a slotted lever fulcrumed on the pivot, a link hinged to the end-gate and to one end of the lever, a catch mounted on the end-gate and arranged to be engaged by the other end of the lever, and means for locking the lever against longitudinal movement when the end-gate is closed, substantially as described.

602,189. RIVET-STICKING MACHINE. LOUIS R. MILLER, Los Angeles, Cal., assignor of one-half to William Lacy, Jr., and Richard H. Lacy, same place. Filed Feb. 7, 1896. Serial No. 578,262. (No model.)

Claim.—1. A rivet-sticking machine comprising a stake having a reciprocating rivet-inserting carrier, and a spring-pressed rivet hole-centering pin adapted and arranged to be moved in the extended path of such carrier, substantially as set forth.

2. In a rivet-sticking machine having a stake and a rivet-carrier within the stake for moving a rivet toward the face of the stake, a rivet-hole-centering pin adapted and arranged to be moved toward and from the stake in the extended path of such rivet-carrier

3. In a rivet-sticking machine the combination of the stake; a rivet-hole punch; a rivet-hole-centering pin arranged in a plane with the punch common to the plane in which the seam is to be made; and means for moving a rivet toward such pin along the extended axis thereof.

4. In a rivet-sticking machine the combination of the stake having a rivet-runway therealong; a rivet-carrier arranged at the end of the runway to seat a rivet; a rivet stop and guide at one side of the carrier; means for moving the carrier toward the face of the stake; and a spring connected with the stake and arranged to press against the head of the rivet to force the rivet against the stop and guide and having its upper edge practically flush with the rivet-seat of the carrier when the carrier is fully thrown out to stick a rivet.

5. The combination set forth of the stake provided with a runway along the stake; means for moving rivets along such runway; a reciprocating rivet-inserting carrier arranged at the end of such runway to move in a path transverse to such runway; a reciprocating slide operatively connected with the carrier to reciprocate the same and also operatively connected with the means for moving the rivets along the runway, to operate such means; and means for operating the slide.

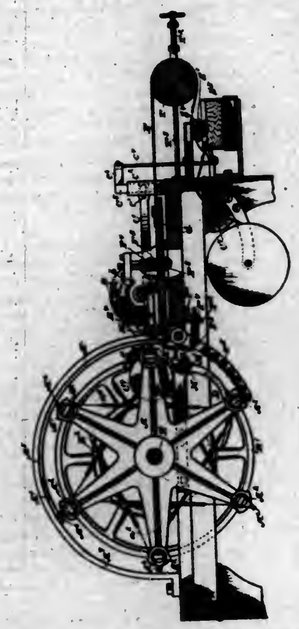
6. The combination of the stake; the rivet-guide closed at one end and open at the other end and arranged transverse the stake; the rivet-carrier arranged beneath the closed end of such guide and provided with a seat to seat a rivet; means for moving the carrier toward the guide; a spring arranged to press upon the head of the rivet when thus seated and to force it toward a point below the closed end of the guide; and a stop and guide to prevent the point of the rivet-stem from passing beyond the guide.

7. The combination of the stake; the rivet-head-engaging spring; the rivet-carrier arranged to move back and forth by the side of such spring and provided with a rivet-seat which is brought flush with the outer edge of the spring when the carrier is thrown out to stick a rivet and a rivet-stop arranged to hold the rivet so that its head will engage with the spring while the carrier moves.

8. In a rivet-sticking machine the combination set forth of the stake; the rivet-guide open at one end and closed at the other end; the rivet-carrier adapted and arranged to receive and seat a rivet and to move it upward toward the closed end of the rivet-guide; means for retaining the rivet on the carrier-seat while it is moving toward the rivet-guide; a rivet-support arranged along and beneath the guide and sloping downward from such carrier; and the means for operating the carrier.

9. In a rivet-sticking machine the combination set forth of the stake; the rivet-runway along the stake; a chute for supplying the runway with rivets; a plunger for moving the rivets along the runway; a rivet-carrier at the end of the runway; means for reciprocating the rivet-carrier transverse the runway; a slide connected with such means and with the rivet-moving plunger to operate them, and means for reciprocating the slide.

10. In a rivet-sticking machine the combination set forth of the stake; the rivet-runway along the stake; a chute for supplying the runway with rivets; a plunger for moving the rivets along the runway; a rivet-carrier at the end of the runway; means for reciprocating the rivet-carrier transverse the runway; a slide connected with such means and with the rivet-moving plunger to operate them; means for operating the slide; a rivet-hole punch; and the reciprocating rivet-hole-centering pin arranged in a common plane with the punch and the seam to be riveted.



11. The combination of the stake; the rivet-guide having on its under side a beveled face to receive the end of the rivet-stem; a rivet-carrier arranged beneath the beveled face of the guide and provided with a seat to seat the head of the rivet; a spring arranged to press upon the head of the rivet when thus seated and to force it toward a point below the beveled face of the guide; and the stop and guide arranged to prevent the end of the rivet-stem from passing beyond such point.

12. In a rivet-sticking machine the combination of the stake provided with a transverse bore and provided on one side with a channel extending from such bore to the rear end of the stake, and with a slideway extending from end to end of the stake, and also provided with a guideway extending from the front end to and beyond the transverse bore; a slide arranged in the slideway; the rivet-carrier arranged in the transverse bore; and the bent slide operatively connected with the carrier by suitable means to cause its reciprocation in the transverse bore, substantially as set forth.

602,140. PAPER-BOX-MAKING MACHINE. CHARLES H. PALMER and JOHN W. DUNCAN, Akron, Ohio. Filed Apr. 19, 1897. Serial No. 632,701. (No model.)

Claim.—1. In a box-making machine that forms the box from a printed or figured strip of paper, a table provided with an aperture having rigid walls that form two sides of the box, the vertically-re-

tating arms A, the horizontally-revolving box-forming dies journaled thereto, the folding oscillating die for folding one edge of the box over the die journaled in the rotating arm as it moves downward, combined with the stationary cam-track and the crank-arms of the die journaled in the rotating arm, to secure the proper action of the dies to fold the other glued part of the box over against the pressure-spring located beneath the table, and said pressure-spring, substantially as shown and described.

2. In a box-making machine, the vertically-rotating arms and their box-forming dies in combination with the oscillating folding-die and its spring-pressure plate that folds over one edge of the box, and the spring-pressure arm, substantially as shown and described.

3. In a box-making machine the vertically-rotating arms and revolving dies, actuated by their crank-arms, the cam track, the oscillating folding die and spring-pressure arm, to form the box, combined with the box-discharging arm and its cam-track that removes the completed box from the dies of the revolving arm in its continuous rotation substantially as shown and described.

4. In a box-making machine the combination of the vertically-rotating arms and revolving die, the fixed oscillating folding-die M and its spring-pressure plate *m* that is caused to oscillate on its pivot M' and fold over the top edge of the box on the rotating die as it is brought in contact therewith, and its spring O and crank *n* that cause it to rock back to its normal position substantially as shown and described.

5. In a box-making machine the intermittent feed-rollers and their pressure flanges or surface provided with an intermittent releasing-notch, one of said rollers being provided with a feed-regulating tooth to admit the free movement of the paper, whereby the paper is fed forward by the feed-regulating tooth independent of the feeding-flanges substantially as shown and described.

6. In a paper-box-making machine the pawl-bearing plate B loosely journaled on its shaft *b'*, the ratchet-plate B' keyed to said shaft, the geared wheel *b*, the pinion b^2, the feed-roll shaft and its adjusting tooth F' and the knife, whereby the material may be regulated and properly timed in feeding a printed and perforated strip of paper to the cutting-knife substantially as shown and described.

7. In a box-making machine for making a box from a continuous printed or figured paper strip provided with regulating feed apertures or notches at regular intervals, the combination of the feed-rollers, the feed regulating tooth carried by one of the rollers operating to intermittently adjust the forward movement of the paper to secure the proper placement of the figure thereon in relation to the box-forming dies, as the paper is fed forward in an intermittent movement in the formation of boxes, substantially as shown and described.

8. In a box-making machine the mechanism for feeding the printed strip having the aperture F^6 for regulating its feed, comprising the rollers having the fluted-tooth F' and the notched flanges to admit a free movement and adjustment of the printed strip forward in combination with the knife H operating substantially as shown and described.

9. In a box-making machine the vertically-moving frame, the intermittently-revolving glue-roller S^3 supported and journaled thereon, the glue-tank in which the roller revolves and provided with its fluted gluing-surface S^4, means for intermittently raising the frame vertically to cause the surface S^4 to place the glue upon the strip of paper that passes over it, substantially as shown and described.

10. In a box-making machine the glue-roller S^3, its intermittent fluted or corrugated gluing-surface S^4 said roller being journaled within the vertically-vibrating frame O^2, the glue-tank, means for intermittently rotating the roller in the tank, and means for vibrating the frame for applying the glue at certain intervals to the paper as it passes over it, substantially as shown and described.

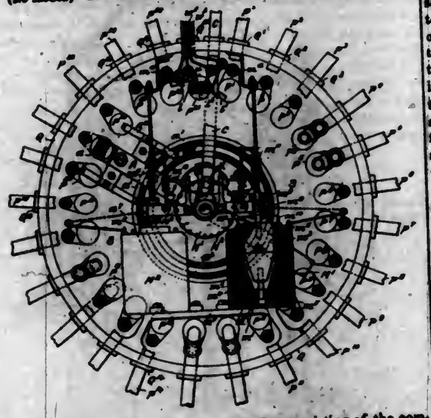
11. The glue-roller shaft S, its ratchet-wheel S' secured thereto, its pawl and crank-arm S^2 loosely journaled thereon, its rod *r'*, actuated by the pivot-pin *r* secured to the continuously-rotating pinion E^2, secured to the shaft E^3, combined with cam-wheel O^3 that causes the lever C to vibrate on its axis C' and impart a vertical vibratory movement to the glue-roller-supporting frame, substantially as shown and described.

12. The glue-roller-supporting arms O^2, their vertically-vibrating rod O^7, the vibrating lever C and its cam-wheel O^3, connections intermediate the rod o^7 and the lever C, whereby an intermittent vertical action is imparted to the gluing-roll substantially as shown and described.

13. In a box-making machine the combination of the vibrating lever E that is pivoted at *e* and provided with the knife H secured to the center of the pivoted arm which is extended to a point below the table, the main actuating-shaft E and the star-wheel E' arranged to press down upon the arm E below the plane of the table and thus secure a right-angle cut upon the strip of paper from which the box is to be formed substantially as shown and described.

14. In a box-making machine that forms the box from a continuous strip of paper, having the printed or figured surface thereon, and provided with adjusting apertures or notches therein, the intermittent rotating and vertically-vibrating glue-roll, the guiding-roll T, the feed-rolls and their guiding-flanges F', the feeding pressure-flanges F^4, the adjusting-notch F^6, and feed-regulating tooth F', the spring holding-fingers A, A, the knife H, and the stop H', in combination with the rotating box-forming dies, substantially as shown and described.

602,141. BICYCLE-SUPPORT. CHARLES C. PLANTES, Hartford, Conn. Filed Mar. 9, 1897. Serial No. 626,642. (No model.)



Claim.—1. In combination with a bicycle having a tubular frame member with its lower end open, a sliding carrier located in said tube, curved legs pivoted to said carrier and crossed when within the tube, a guide-pin located between the legs near the lower end of the tube, each of said legs held within the tube by yielding pressure and having a stop-shoulder cooperating with the guide-pin when the legs are extended, and means for moving the carrier, all substantially as described.

2. In combination with a bicycle having a tubular frame member *a* with an open lower end, a reciprocating carrier *c* located in said tube, curved yielding legs *f*, *f'*, pivoted to said carrier and crossed when within the tube, stop-shoulders f^2, f^3, on said legs, a guide-pin *g* fixed across the tube near its lower end and located between the said legs, each leg when within the tube making contact with the opposite inner walls whereby it is held with a yielding grasp against movement, and the means for reciprocating the carrier, all substantially as described.

3. In combination with a bicycle having a tubular frame member with its lower end open, a perforated cap partly covering the lower end, a reciprocating carrier located in said tube, curved legs pivoted to said carrier and crossed when within the tube, a guide pin located between said legs near the lower end of the tube, each of said legs having a stop shoulder cooperating with the guide-pin when the legs are extended, means for holding the legs within the tube, and means for reciprocating the carrier, all substantially as described.

602,142. SUPPLY SYSTEM FOR ELECTRIC RAILWAYS. PERCIVAL J. PERKINS, London, England, assignor of one-half to Julian Mossay Vernon Mossay-Kant, same place. Filed Oct. 27, 1893. Serial No. 610,210. (No model.) Patented in England Feb. 2, 1894, No. 2,274.

Claim.—1. A system of electric traction consisting of the combination of a rail or tramway track forming the return-circuit, an electrically-propelled vehicle on the track having collectors attached which pick up the current from a series of surface plates or rails a certain number of which form a block, and a shunt-collector on the vehicle connected to return-rail through a resistance also carried on vehicle, a main supply-conductor from source of electricity and conductors from distributers to the separate sections of a block, a series of distributers one for each block of sections for successively connecting the current from the main supply to the said separate sections in exact relationship with the movement of the car or vehicle substantially as set forth.

2. In a system of electric traction in which current is fed to the car from a number of separate short conducting-sections, a certain number of each sections forming a block for lines on which cars travel; a current-distributer for each block consisting of a magnet in shunt with the main supply to car and a movable armature connected to and operating a rocking bar provided with return-springs and pawl and ratchet-wheel for automatically actuating a main-current-distributing arm with a shunt-arm arranged to rotate over contact-pieces for successively connecting the main current from the source of supply to the said separate sections and disconnecting same as and when required, and the circuit connections from main supply through distributer to section and car-motor and resistance to return-circuit substantially as set forth.

3. In a system of electric traction in which the current is fed to the car from a number of short conducting-sections a certain number of each sections forming a block for tram-lines on which cars travel in both directions, a reversing-distributer for each block comprising two magnets in shunt with the main supply to car their movable armatures connected to and operating a rocking bar provided with return-springs and pawls and ratchet-wheels for automatically actuating a main-current-distributing arm with two shunt-arms arranged to rotate in both directions over contact-pieces for successively connecting the main current from the source of supply to the said separate sections and disconnecting same as when required, and the circuit connections from main supply through distributer to sections and car-motor and resistance to return-circuit.

4. A distributer for use in a system of electric traction of the kind above described consisting of the combination of a rotary main supply contact-arm connected with a source of electrical supply, two small contact-arms on each side of main arm but insulated therefrom, two contact-rings on which the former have connection each connected through one of a pair of magnets to the source of supply, said magnets being excited in shunt by means of a collector and resistance carried by a vehicle, a rocking switch permitting only one of the magnets being excited at one time, two movable armatures connected to opposite ends of a rocking bar, springs attached to opposite ends of rocking bar and two pawls together with controlling-springs, two oppositely-cut ratchet-wheels permitting the main arm to be moved one contact at a time in either direction and locking-catches for ratchets and means for operating same, a series of contacts arranged circumferentially, a series of feeder-cables attached to same, standards for feeder-cables, the whole inclosed in a casing provided with bosses and glands for feeder and main cables substantially as set forth.

5. A distributer for use in a system of electric traction of the kind above described consisting of the combination of a main supply contact-arm connected with the source of electrical supply, a shunt contact arm insulated from main arm, a contact-ring on which the shunt-arm makes contact each connected through an electric magnet to the source of supply, said magnet being excited in shunt by means of a collector and resistance carried by vehicle, the movable armature of magnet connected to a rocking bar, a spring opposed to action of magnet and attached to rocking bar and pawl together with its controlling-springs and a ratchet-wheel permitting the main arm to be moved one contact at a time and locking-catches for ratchet and means for operating same, or series of contacts arranged circumferentially, a series of corresponding feeder-cables attached to same and standards for feeders, the whole inclosed in a casing provided with glands for main and feeder cables substantially as set forth.

6. A system of electric traction consisting of the combination of a rail or tramway-track forming the return-circuit, an electrically-propelled vehicle on the track having collectors attached which pick up the current from a series of surface plates or rails a certain number of which form a block, and a resistance for the block in shunt from the distributer to the return-rail, a main conductor from source of electricity and a series of distributers one for each block of sections for successively connecting the main supply to the said separate sections simultaneously with the movement of the vehicle and cutting in resistance when required, substantially as set forth.

7. A distributer for use in a system of electric traction of the kind above described consisting of the combination of a main supply contact arm connected with a source of supply, six shunt contact-arms connected with one another in pairs, three on each side of but insulated from main contact-arm, four contact-rings on which the said shunt-arms make contact, two of which are connected in shunt through a pair of magnets to the source of supply, and the other two connected respectively through two permanent stationary resistances to the return-rail, said magnets being excited by a shunt-current from main supply through the stationary resistance, a rocking switch permitting only one magnet to be excited at one time, the movable armatures of said magnets connected to opposite ends of a rocking bar and two pawls together with controlling-springs, two oppositely-cut ratchet-wheels permitting the main and shunt arms to be moved one contact at a time in either direction, and locking-catches for ratchets and means for operating same, a series of contacts arranged circumferentially, standards attached to same, a series of feeder-cables attached to standards, the whole inclosed in a casing having bosses and glands for main and feeder cables substantially as set forth.

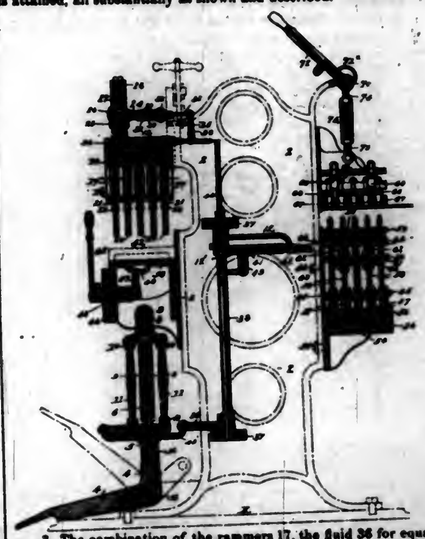
8. A distributer for use in a system of electric traction of the kind above described consisting of the combination of a main supply contact-arm connected with a source of supply, two shunt contact-arms on each side of but insulated from the main contact-arm, two contact-rings on which the said shunt-arms make contact, one of which is connected in shunt through a magnet to the source of supply and the other connected through a permanent stationary resistance to the return-rail, said magnet being excited by a shunt-current from main supply through the stationary resistance, the movable armature of said magnet being connected to end of rocking bar and pawl together with controlling-springs, two oppositely-cut ratchet-wheels permitting the main and shunt arms to be moved one contact only at a time in one direction only, and locking-catch for ratchet and means for operating same, a series of contacts arranged circumferentially, standards attached to same, a series of feeder-cables attached to standards, the whole inclosed in a casing having bosses and glands for main and feeder cables substantially as set forth.

9. In a system of electric traction, the combination of an electrically-propelled vehicle having one or more main collectors making contact successively with a series of surface plates or rails, a shunt-brush on the vehicle directly in advance of the main collectors making contact successively with the said series of surface plates or rails and a resistance in the vehicle directly connected to the return-rail and the shunt-brush whereby a shunt-current can flow directly between the main-supply conductor and the return-rail, through the resistance and the magnets of the various distributers in circuit and so actuate said magnets, substantially as set forth.

10. In a system of electric traction in which the rails form a return-circuit and the electrically-propelled vehicle on the track has collectors attached, which pick up current from a series of surface plates or rails a certain number of which form a block, and in addition has a shunt-collector and resistance carried on the car for the purpose of operating vehicles passing to a branch line the combination of two reversing-distributers each consisting of a rotary main supply contact-arm two contact-arms one on each side of said arm but insulated therefrom, two contact-rings with which the side arms have connection, two magnets, a rocking bar, two springs and pawls, controlling-springs, two oppositely-toothed ratchet-wheels, contact-feeders cable and connections substantially as described with a third distributer consisting of a rotary main supply-arm, three side contact-

arms, two of which are arranged at the side of the main supply contact-arm and making contact with two rings and the third arm adjoining one of these side contact-arms, and insulated from them and the main supply-arm, one end of said third arm making contact with a third contact-ring and the other end making contact with an additional small contact, three magnets, two being arranged same as before described, the third making connection between the additional side contact and the main supply-conductor, a rocking arm, two springs and pawls, controlling-springs, oppositely-toothed ratchet-wheels, contacts, feeders, cables and connections, substantially as described the whole working as and for the purpose above set forth.

11. In a system of electric traction in which the rails form a return-circuit and the electrically-propelled vehicle on the track has collectors attached, which pick up current from a series of surface plates or rails a certain number of which form a block and in addition has a shunt-collector and resistance carried on the car and also has a reversible shunt collector which can be connected to either of two resistances carried on car the combination of a reversing-distributer consisting of a rotary main supply contact-arm two contact-arms one on each side of said arm but insulated therefrom, two contact-rings with which the side arms have connection, two magnets, a rocking bar, two springs and pawls, controlling-springs, two oppositely-toothed ratchet-wheels, contact-feeders cables and connections substantially as described, with a reversing-switch carried on vehicle consisting of contact-arms one more than there are collectors (including main and shunt) on the car the outside ones being each connected to return-rail through one of the resistances carried in car and the same number of contact-pieces as there are collectors these being connected to same as and for the purposes set forth.



12. In a system of electric traction in which the rails form a return-circuit and the electrically-propelled vehicle on the track has collectors attached, which pick up current from a series of surface plates or rails a certain number of which form a block and in addition has a shunt-collector and resistance carried on the car Z for the purpose of supplying current to the motor of any car which has run into any section of a block then occupied but just cleared, the combination of a reversing-distributer consisting of a rotary main supply contact-arm, two contact-arms one on each side of said arm but insulated therefrom, two contact-rings with which the side arms have connection, two magnets, a rocking bar, two springs and pawls, controlling-springs, two oppositely-toothed ratchet-wheels, contact-feeders cables and connections substantially as described with a separate switch provided with means for operating it by hand consisting of a series of circularly-arranged contacts connected to a series of successive sections, commencing at the first or last section of a block, an extra insulated contact a rotating contact-arm connected to the return-rail through a resistance as and for the purpose set forth.

13. In a system of electric traction in which the rails form a return-circuit and the electrically-propelled vehicle on the track has collectors attached, which pick up current from a series of surface plates or rails, a certain number of which form a block and in addition has a shunt collector and resistance carried on the car for the purpose of electrically disconnecting the exposed section immediately in the rear of the section supplying current to a car the combination of a reversing-distributer consisting of a rotary main supply contact-arm, two contact-arms one on each side of said arm but insulated therefrom, two contact-rings with which the side arms have connection, two magnets, a rocking bar, two springs and pawls, controlling-springs, two oppositely-toothed ratchet-wheels, contact-feeders cables and connections substantially as described with an automatic switch actuated by the movement of the rotary main supply contact-arm consisting of a rocking arm held flexibly in a straight position by means of the clips and springs controlling its position, a contact at each end of the rocking arm being connected to that contact-arm (on each side of the rotary main supply contact-arm) directly opposite same, two separately-insulated contact-pieces each connected to one of the distributer-magnets as and for the purpose set forth.

602,143. CARTRIDGE LOADING AND CRIMPING MACHINE. FREDERICK RAYMOND, Sedalia, Mo. Filed Sept. 7, 1897. Serial No. 650,860. (No model.)

Claim.—1. In a machine for loading or crimping gun-shells, the combination with a loading or crimping block capable of holding a number of gun-shells in position to be loaded or crimped simultaneously, a corresponding number of rammers or crimpers, each capable of an independent longitudinal movement, means for pressing the shells against said rammers or crimpers, and a fluid for equalizing the pressure on said rammers or crimpers, all substantially as and for the purpose set forth.

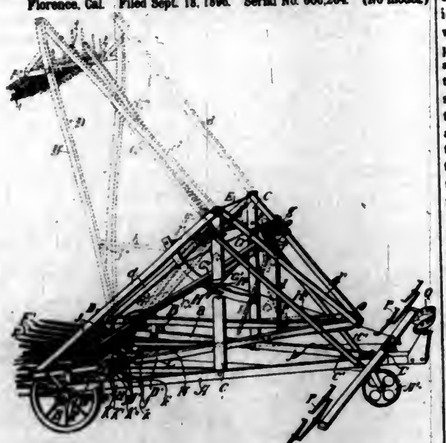
2. In a machine for loading gun-shells, the combination of a loading-block capable of holding a number of shells in position to be loaded simultaneously, a corresponding number of rammers, each capable of an independent longitudinal movement, a fluid for equalizing the pressure on said rammers, a lever for applying the pressure, and means for automatically releasing said lever as soon as the desired pressure is attained, all substantially as shown and described.

3. The combination of the rammers 17, the fluid 36 for equalizing the pressure on said rammers, the valve 26 capable of being opened by the pressure of said fluid when the desired pressure is attained, the piston 31 capable of being acted upon by said fluid after it has passed through said valve, the movable carriage 3 for the loading-block, the shells therein, the lever 12 for moving said carriage so as to press the shells against said rammers, and means controlled by the movement of said piston for releasing said lever, all substantially as shown and described.

4. In a machine for loading gun shells the combination of the equalizing fluid 36, the rammers 17 capable of acting independently as plungers against said fluid, the valve 26 capable of being opened by the pressure of said fluid when the desired pressure is attained, the piston 31 capable of being acted upon by said fluid after it passes through said valve, the hand-lever 12 provided with a releasing-lock operated by the movement of said piston, for the purpose of releasing said lever, when the desired pressure is attained, the carriage 3 capable of being moved by said lever so as to press the shells against said rammers, and the adjustable table 53 for the purpose of adjusting the shells for receiving the different charges, substantially as shown and described.

5. The combination of the rammers 17, the equalizing fluid 36, the valve 26, the piston 31, the rod 30, the bell crank 33, the rod 44, the bell-crank 43, the lever 12 provided with a releasing-lock consisting of the latch-pieces 41 and 42, the shaft 38 with its arm 39, the connecting-rod 40, the plate 7, the posts 11, 11, and the carriage 3 all adapted to act automatically substantially as and for the purpose shown and described.

602,144. LOCK. WOODBURY D. ROSSMAN, Portland, Oreg. Filed May 25, 1897. Serial No. 638,062. (No model.)



Claim.—1. In a lock as described, the combination of the jaws, the pivot-bolt, one of such jaws having endwise movement on the pivot, the cap-plate, the volute spring having one end held in engagement with the pivot-bolt and the other in engagement with the said jaw, and means for holding the jaws to a locked engagement, substantially as described.

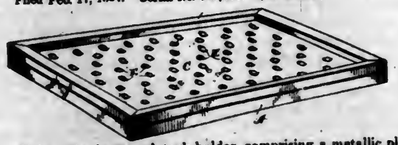
2. In a lock as described, the combination with the pivotally-connected jaws, one of which has a recess having a keyway at one end and a seat in its bottom edge adjacent the pivot end, and the other having a lock-lip, of a series of tumblers or detents having each a pendent portion to engage the seat, a tailpiece to cover the keyway, a lock-nose at the upper front end, a concaved front edge and a spring, substantially as shown and for the purposes described.

3. An improved padlock, comprising a pair of jaws having interlocking ends, one of such jaws having endwise movement on its pivot, and means for automatically swinging it outward when the hook ends are disengaged, said swinging jaw having a lock-lip, the fixed jaw having a recess provided with a keyway at one end and a seat in the opposite edge at a point near the pivotal axis, a series of tumblers or detents independently fulcrumed in the aforesaid seat, springs held to their normal position, each having a tailpiece to normally cover the keyway and a nose-piece at the front upper edge to engage the lock shoulder on the swinging jaw and the cap-plate all being arranged substantially as shown and for the purposes described.

602,145. HAY RAKE AND STACKER. RUFUS A. SIMPSON, Florence, Cal. Filed Sept. 18, 1896. Serial No. 606,264. (No model.)

Claim.—1. A combined rake and stacker comprising a wheel-supported frame having upwardly-projecting standards; a swinging frame pivoted to said standards and carrying at its front end pivoted hay raking and carrying teeth; a crank-shaft journaled to the swinging frame and provided with a projecting crank; an adjusting-rod connecting the crank with the teeth; a guide secured to the stationary frame and adapted to receive and guide the crank-arm; a drum adapted to be operated by the rotation of the supporting-wheels; a flexible connection wound about the drum, passed to the rear and secured to the rear end of the swinging frame; suitable clutch and brake mechanism adapted to connect and disconnect the drum with the supporting-wheels; and means for releasing the crank-arm to allow the rake-teeth to tilt.

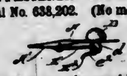
2. In a hay rake and stacker, the combination set forth of the wheel-supported base-frame; the uprights secured to such frame; the swinging frame comprising two base members secured together in V shape, front supporting members secured to the front of the V-shaped base diverging upward therefrom and pivotally secured to the uprights, rear supporting members secured to the rear end of the V-shaped base diverging forwardly and outwardly and pivotally secured to the uprights; rake-teeth pivotally secured to the front end of the swinging frame; and means adapted to swing the frame on its pivotal support to elevate the rake-teeth.



3. A combined hay rake and stacker comprising a triangular frame provided with upwardly-projecting standards and supported at its front end upon an axle; supporting-wheels mounted upon and adapted to rotate such axle; a swivel-wheel supporting the rear end of the frame; a triangular swinging frame pivoted to the top of the standards; rake-teeth pivotally secured to the front end of the swinging frame; a crank-shaft carried by the swinging frame; an adjusting-rod connecting the rake-teeth with the crank-shaft; suitable means for operating the crank-shaft to hold the rake-teeth approximately horizontal as the swinging frame is swung forward to carry its front end upward; a drum adapted to be operated by the rotation of the supporting-axle; a flexible connection wound upon the drum and secured to the rear end of the swinging frame; a clutch adapted to connect and disconnect the drum with the supporting-axle; and a brake adapted to control the movement of the drum.

4. A hay rake and stacker comprising the combination of a frame mounted upon an axle and provided with upwardly-projecting standards; wheels secured upon the axle and adapted to rotate it; a swinging frame pivoted to the top of the standards; a crank-shaft journaled to the swinging frame and provided with a projecting crank-arm; a trip-guide secured to the fixed frame and adapted to guide the crank-arm while the swinging frame is being swung upon its pivots; an adjusting-rod connecting the crank-shaft with the rake-teeth; an adjusting-lever pivoted upon the crank-shaft and provided with projecting arms adapted to engage the crank to partially rotate it to adjust the rake-teeth; a stop secured to the swinging frame and adapted to limit the movement of the adjusting-lever; a drum journaled upon the supporting-axle; a clutch adapted to connect and disconnect the drum with the axle; a brake adapted to control the movement of the drum; a flexible connection wound about the drum, passed to the rear, over a pulley journaled in the movable frame, and thence forward and secured to the adjusting-lever; and means for operating the trip-guide.

5. A hay rake and stacker comprising the combination set forth of a V-shaped base-frame supported upon an axle; suitable supporting-wheels arranged upon and adapted to rotate the axle; a swivel-wheel arranged to support the rear end of the base-frame; upwardly-projecting standards secured to the frame; a swinging frame pivotally secured to the top of the standards; rake-teeth pivotally secured to the front end of the swinging frame; a crank-shaft pivoted to the swinging frame; an adjusting-rod connecting the crank-shaft with the rake-teeth, adapted to adjust the rake-teeth and provided with a crank-arm; a U-shaped guide pivoted to the base-frame and adapted to receive and guide the crank-arm; a trip-clutch adapted to engage the guide to hold it in position to guide the crank-arm and to be tripped to allow the guide to release the arm; an adjusting-lever pivoted upon the crank-shaft and provided with a projecting arm adapted to engage the crank to adjust the rake-teeth; a drum journaled upon the supporting-axle; a clutch adapted to connect and disconnect the drum with the supporting-axle; a brake adapted to control the movement of the drum; and a flexible connection wound about the drum, passed to the rear over a supporting-pulley journaled in the movable frame, thence forward and secured to the adjusting-lever.

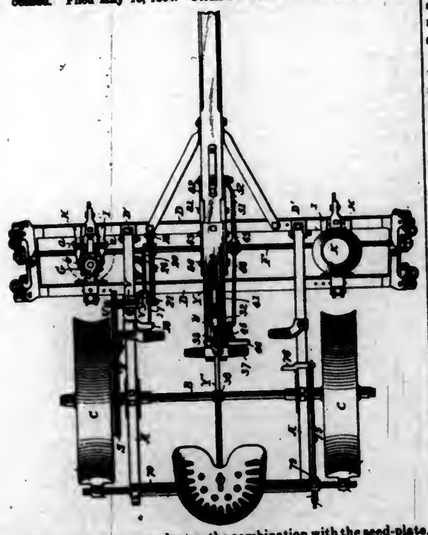


6. In a hay rake and stacker the trip-guide set forth comprising a U-shaped member pivotally secured to a support; and a dog adapted to engage such member to lock it in position or to be released to allow the guide to swing with its mouth open in either direction.

602,146. TACK-HOLDER. FREDERIC W. SONGER, Alcott, Colo. Filed Feb. 17, 1897. Serial No. 623,878. (No model.)

Claim.—An improved tack-holder, comprising a metallic plate formed on its top surface with a plurality of circular depressions or indentations, the center of each depression being formed with a perforation with the metal upset in forming the perforation depending from the under side of the plate and forming a tubular holder, the tack-points being adapted to extend through the tubular holders with their heads filling the plate depressions and making the top surface of the plate substantially unbroken, a rim projecting above and surrounding the top surface of the plate, and a rim depending therefrom and similarly surrounding the under surface of the plate and serving to sustain the tack-holding plate free from a table or other support, substantially as shown and described.

602,147. SHOE-FASTENER. JOHN STECH, Butte, Mont. Filed May 26, 1897. Serial No. 638,202. (No model.)



Claim.—1. In a shoe-fastener the combination of an eye or catch secured to the lower flap of a shoe, with a securing device comprising the body E', secured on the lower surface of the upper flap of the shoe and formed with the arms e^2, and e^3, comprising the hook E^3, to engage said eye, the button D, having the eyelet-shank d, secured on the upper flap and between the arms of the hook by means of the wire of which the hook is a portion, substantially as described.

2. In a shoe-fastener the combination of the catch C, having the arms c', bent back upon themselves to secure said catch to the lower flap of the shoe, with the securing device comprising the body E', secured on the lower surface of the upper flap of the shoe and formed with the arms e^2, and e^3, comprising the hook E^3, to engage said eye, the button D, having the eyelet-shank d, secured on the upper flap

and between the arms of the hook by means of the wire of which the hook is a portion, substantially as described.

602,148. CORN-PLANTER. JOHN D TRACY and JAMES F. PLATT, Sterling, Ill.; John W. Platt administrator of said James F. Platt, deceased. Filed May 10, 1897. Serial No. 635,927. (No model.)

Claim.—1. In a corn-planter, the combination with the seed-plate, of a rock-shaft provided with two projecting arms a pawl pivotally mounted upon each arm of the rock-shaft for imparting movement to the seed-plate at each half-stroke of said shaft, substantially as described.

2. In a corn-planter, the combination with the rock-shaft, and the seed chute or tube, of a reciprocating pitman in the tube operated by the shaft, a seed-cut-off valve, a discharge-valve in movable connection with the lower end of said pitman, and a seat upon the seed-chute for said discharge-valve, substantially as described.

3. In a corn-planter, the combination with the rock-shaft, and the chute or tube, of a reciprocating pitman in the tube and formed with two surfaces out of alinement with each other, a cut-off valve in the tube adjacent to the intersection of the two surfaces, and a pivoted discharge-valve at the lower end of the tube and in movable connection with the pitman, and a seat for the discharge-valve, substantially as described.

4. In a corn-planter, the combination with the rock-shaft, of a seed chute or tube, a reciprocating pitman in the tube operated from the rock-shaft, a discharge-valve formed with an open pocket communicating with the seed-chute at one end, said valve being adapted to a seat upon the seed-chute and connected to the pitman to be moved thereby from its seat to open the discharge end of the pocket, substantially as described.

5. In a corn-planter, the combination with the rock-shaft, and the seed chute or tube, of a reciprocating pitman in the tube operated by the shaft, a discharge-valve in movable connection with the lower end of said pitman and comprising an open pocket, a seat for said valve, and a cut-off valve intermediate the ends of the pitman, substantially as described.

6. In a corn-planter, the combination with the rock-shaft, and the seed chute or tube, of a reciprocating pitman in the tube operated by a wrist-pin on the shaft, a discharge-valve in movable connection with the lower end of said pitman and comprising an open pocket, a seat for said valve, a cut-off valve intermediate the pocket and wrist-pin, and means for holding the latter valve in its open and closed positions relative to the pitman, substantially as described.

7. In a corn-planter, the combination with the rock-shaft having the wrist-pin, and the seed chute or tube, of a reciprocating pitman in the tube operated from the wrist-pin, a discharge-valve in movable connection with the lower end of said pitman and comprising an open pocket, a seat for said valve, a cut-off valve, and a spring for holding the latter in its open and closed positions relative to the pitman, substantially as described.

8. In a corn-planter, the combination of the main frame, the rock-shaft and the seed-plates operated by the latter, the pitman-rod and crank-shaft for operating the rock-shaft, and a movable locking device for maintaining said pitman in operative connection with the rock-shaft when the frame is down, and for releasing or breaking such connection on the raising of the frame, substantially as described.

9. In a corn-planter, the combination with the main frame, the rock-shaft and seed-plates operated by the latter, of a crank-shaft and a pitman for operating the rock-shaft, and a pivoted latch and a slide for maintaining the pitman in operative connection with the rock-shaft when the frame is down, and for releasing or breaking said connection on the raising of the frame, substantially as described.

10. In a corn-planter, the combination with the main frame and the rock-shaft, of a slotted slide in movable connection with said shaft, a reciprocating pitman, and means for locking the pitman to the slide when the frame is down and for unlocking the same on lifting the frame, substantially as described.

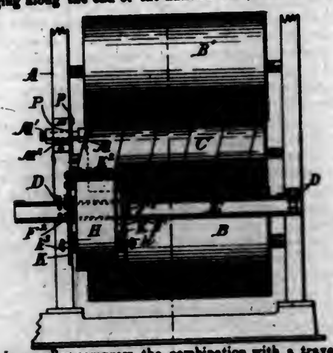
11. In a corn planter, the combination with the main frame and the rock-shaft, a reciprocating pitman, an arm on the shaft, a slotted slide working in a guide on the frame and in connection with said arm, a pivoted latch for locking the slide and pitman together when the frame is down, and means for unlocking the same on raising the frame and permitting the pitman to work idle in the slot of the guide, substantially as described.

12. In a corn-planter, the combination with the main frame and the rock-shaft, of a reciprocating pitman, a reciprocating slide in connection with said shaft and having a longitudinal slot, a latch-bar pivoted to the slide and constructed at its forward end to engage a stud on the pitman, the said latch and slide having engaging guide-arms, and means on the frame for raising the latch as the frame is lifted, substantially as described.

13. In a corn-planter, the combination with the wheels, of a rock-shaft to the rear thereof, adjustable scrapers or blades on said shaft, an arm on the shaft, a connecting-rod passing through the arm, a spring and adjusting-nuts, and a lever operated by the foot of the driver, substantially as described.

602,149. CLAMPING DEVICE. ROLLIN H. WHITE, Cleveland, Ohio, assignor to the A. L. Moore Company, same place. Filed June 17, 1897. Serial No. 641,103. (No model.)

Claim.—1. In a clamping device, in combination, the fixed tubular member having an external shoulder and a parti-cylindrical end with beveled edges, a split ring having a parti-cylindrical end with beveled edges, which end is complementary to the corresponding end of the tubular member, and means for moving said two parts relatively in a path parallel to their axes, substantially as and for the purpose specified.



2. In a clamping device, in combination, the fixed tubular member having an external shoulder and a parti-cylindrical upper end with undercut edges, a split ring externally threaded on its upper end and having its lower end of parti-cylindrical form, complementary to the corresponding part of the fixed member and having undercut edges, and a nut screwed onto the split ring and engaging with the external shoulder on the fixed member, substantially as and for the purpose specified.

3. The combination of the front-fork head having a parti-cylindrical upper end with undercut edges, a sleeve D having a ball-cup *d'*, which is screwed onto said fork-head, an externally-threaded split ring having an unthreaded parti-cylindrical end with undercut edges, which end is complementary to the corresponding end of the fork-head, and a nut which screws onto the ring and abuts against the top of said sleeve D, substantially as and for the purpose specified.

602,150. BAGGING ATTACHMENT FOR ROLLER-COMPRESSES. DAVID C BALL, St. Louis, Mo., assignor to the American Cotton Company, New York, N. Y. Filed Nov. 2, 1896. Serial No. 567,744. (No model.)

Claim.—1. The combination with a roller-compress, of a traveling carriage and means for journaling a roll of bagging thereon, and an adjustable knife adapted to trim the said bagging from the end of the covered bale, substantially as described.

2. The combination with a roller-compress, of a traveling carriage and means for journaling a roll of bagging thereon, of a knife rigidly attached to the frame of the compress, and adapted to trim the bagging along the end of the finished bale, substantially as described.

3. In a roller-compress, the combination with a traveling carriage and means for guiding the same from one end of the core-roll to the other, of means for journaling a roll of bagging on said carriage, to be fed to the core-roll, and means for automatically trimming the said bagging along the end of the finished bale, substantially as described.

4. In a roller-compress, the combination with a traveling carriage and means for guiding the same from one end of the core-roll to the other, of means for journaling a roll of bagging on said carriage to be fed to the core-roll, and a knife rigidly attached to the frame of the compress and adapted to trim the bagging along the edge of the finished bale, substantially as described.

5. The combination with a roller-compress, of a traveling carriage, means for journaling a roll of bagging on said carriage to be fed to the core-roll, tension devices interposed between said roll of bagging and said core-roll, and means for automatically trimming the said bagging along the edge of the covered bale, substantially as described.

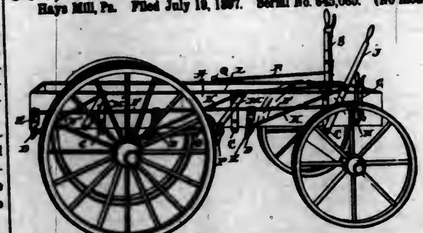
6. The combination with a roller-compress, of a traveling carriage, means for journaling a roll of bagging on said carriage to be fed to the core-roll, tension devices interposed between said roll of bagging and said core-roll and a knife adapted to trim the edge of said bagging along the edge of the covered bale, substantially as described.

7. In a roller-compress, the combination with a traveling carriage and means for guiding the same from one end of the core-roll to the other, and means for journaling a roll of bagging on said carriage to be fed to the core-roll, tension devices interposed between said roll of bagging and said core-roll, and a knife rigidly attached to the frame of the compress and adapted to trim said bagging along the edge of the covered bale, substantially as described.

8. In a roller-compress, the combination with an I-rail secured to the frame of the press and approximately parallel to the axes of the rolls, of a carriage traveling on said I-rail, with rollers engaging the upper and lower flanges of said rail, means for journaling a roll of bagging on said carriage, to be fed to the core-roll, tension devices carried by said carriage, and interposed between said bagging-roll and said core roll, and means for automatically trimming said bagging along the edge of the covered bale, substantially as described.

9. In a roller-compress, the combination with an I-rail secured to the frame of the press, and approximately parallel to the axes of the rolls of a carriage traveling on said I-rail with rollers engaging the upper and lower flanges of said rail, means for journaling a roll of bagging on said carriage to be fed to the core-roll, tension devices carried by said carriage and interposed between said bagging-roll and said core-roll, and a knife rigidly attached to the frame of the compress, and adapted to trim the said bagging along the edge of the covered bale, substantially as described.

10. In a roller-compress, the combination with a rail secured to the frame of the press, and approximately parallel to the axes of the rolls, of a carriage traveling on said rail, means for journaling a roll of bagging on said carriage to be fed to the core-roll, tension devices interposed between said roll of bagging and said core-roll, and means for automatically trimming the said bagging along the edge of the covered bale, substantially as described.



11. In a roller-compress, the combination with a rail secured to the frame of the press and approximately parallel to the axes of the rolls, of a carriage traveling on said rail, means for journaling a roll of bagging on said carriage to be fed to the core-roll, tension devices interposed between said roll of bagging and said core-roll, and an adjustable knife mounted in the framework of the compress and adapted to trim the said bagging along the edge of the covered bale, substantially as described.

12. The combination with a roller-compress, of a swiveled traveling carriage, means for journaling a roll of bagging carried thereon, and an adjustable knife adapted to trim the said bagging from the end of the covered bale, substantially as described.

13. In a roller-compress, the combination with a traveling carriage and means for guiding the same from one end of the bale in the press to the other, of means for journaling a roll of bagging on said carriage to be fed to the bale, and having its axis at an angle to the axis of the bale, and means for automatically trimming the said bagging along the ends of the finished bale, substantially as described.

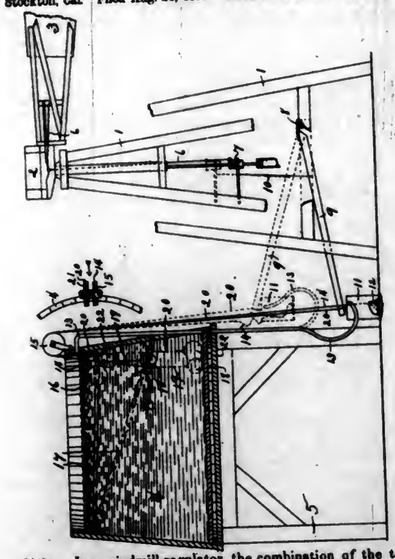
14. In a roller-compress, the combination with a rail secured to the frame of the press, and approximately parallel to the axes of the rolls, of a carriage traveling on said rail, with a support for a roll of bagging swiveled thereon, means for feeding the said bagging under tension to the bale in the press, and means for automatically trimming the said bagging along the edge of the covered bale, substantially as described.

602,151. DUMPING-WAGON. JOHN BECKER and GEORGE BECKER, Hays Mill, Pa. Filed July 19, 1897. Serial No. 645,065. (No model.)

Claim.—1. In a dumping-wagon, the combination of sides A, downwardly-swinging bottom sections B, the rear axle, one of the bottom sections swinging vertically adjacent the axle, the bail-shaped brake-beam mounted to swing vertically on the front side of the axle with its extremities extending to the wheel-peripheries, and brake-shoes on the beam extremities, substantially as shown and described.

2. In a dumping-wagon, the combination of sides A, downwardly-swinging bottom sections B, one section being arranged to swing vertically adjacent the rear axle, a bail-shaped brake-beam mounted to swing vertically on the front of the axle without interfering with the vertical movement of said bottom sections, an L-shaped brake-actuating lever, and brake-blocks securing to the extremities of the brake-beam arms, substantially as shown and described.

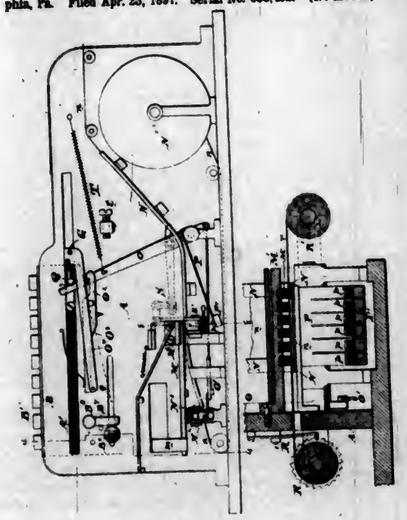
602,152. EGG-BEATER. FRANK S. BELLANGER, Waterbury, Conn., assignor to D. J. Barry & Co., New York, N. Y. Filed Jan. 23, 1897. Serial No. 620,009. (No model.)



Claim.—1. An egg-beater, comprising a frame provided with parallel guide-rods having a handle at their upper ends, and with a series of parallel arms at the lower ends of the guide-rods, a beater having a screw-rod whose upper end is mounted in a socket in the handle, and a series of parallel fingers at the lower end of the screw-rod, the central finger being longer than the others and mounted in a socket between two of the arms of the frame, and a nut sliding on the guide-rods of the frame and engaging the screw-rod of the beater, substantially as described.

2. An egg-beater, comprising a frame formed of a single piece of wire bent to form parallel guide-rods and a series of doubled-up parallel arms at the lower ends of the guide-rods, a handle secured to the upper ends of the guide-rods, a beater formed of a single piece of wire bent to form a screw-rod and parallel fingers at the lower end of the screw-rod, the beater being mounted in the frame with its screw-rod projecting up between the guide-rods of said frame and its fingers between the arms thereof, and a nut sliding on said guide-rods and engaging the screw-rod of the beater, substantially as described.

3. An egg-beater, consisting of a frame formed of a single piece of wire bent to form parallel guide-rods and parallel arms at the lower ends of the guide-rods, a socket being formed between two of the said arms, a handle secured to the upper ends of the guide-rods, a beater formed of a piece of wire bent to form a screw-rod whose upper end is mounted in a socket in the handle and a series of parallel



fingers at the lower end of the screw-rod, the central finger being longer than the others and mounted in the socket between the arms of the frame, and a nut sliding on the guide rods and engaging the screw-rod, substantially as herein shown and described.

602,158. WINDMILL-REGULATOR. WESTLEY P. H. CAMPBELL, Stockton, Cal. Filed Aug. 21, 1897. Serial No. 649,078. (No model.)

Claim.—In a windmill-regulator, the combination of the tank, the vessel arranged to hang suspended from mechanism for throwing the wheel of the mill into and out of the wind and having the upwardly-opening valve 12 in its bottom, the flexible pipe connecting the tank and the vessel, the weight 22, a cord taking over a sheave on the tank and connecting the weight 22 with the vessel, the float arranged in the tank, a cord taking over a sheave on the tank and connecting said float with the valve 12 of the vessel, and the weight 18 suspended from the said float, substantially as and for the purpose set forth.

602,154. ADDING-MACHINE. CHARLES C. CLIFFORD, Philadelphia, Pa. Filed Apr. 23, 1897. Serial No. 633,432. (No model.)

Claim.—1. In an adding-machine, the combination of a series of sets of keys each independently movable, a series of sliding step bars each adapted to be operated by a set of the keys, means to move the keys relatively to the step-bars, a series of registering devices respectively operated by the step-bars, transferring devices controlled by the registering devices of one order of numbers to move the registering devices of the next higher order one point, and means acting after the direct action of the step-bars upon the registering devices to operate the transferring devices.

2. In an adding-machine, the combination of a series of sets of keys, a series of step-bars operated by the keys, means to move the keys relatively to the step-bars, a series of registering devices respectively operated by the step-bars, means to move the registering devices from the step-bars, transferring devices controlled by the registering devices of one order of numbers to move the registering devices of the next higher order one point, means acting after the direct action of the step-bars upon the registering devices to operate the transferring devices, and a shield controlled by the transferring devices to shield the numbers of the registering devices from view in case said transferring device becomes inoperative or fails to register.

3. In an adding-machine, the combination of a series of sets of keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, and means acting after the direct action of the step-bars upon the registering devices to operate the transferring devices.

4. In an adding-machine, the combination of a series of sets of keys, a series of step-bars operated by the keys, means to move the keys relatively to the step-bars, a series of registering devices respectively operated by the step-bars, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, a transfer-operating frame having operating parts for imparting motion to the transferring device, and hand-operated devices for reciprocating the transfer-operating frame.

5. In an adding-machine, the combination of a series of sets of keys, a keyboard for said keys, a series of step-bars operated by the keys, means for moving the keyboard, a series of registering devices respectively operated by the step-bars, transferring devices controlled by the registering devices of one order to move the registering devices of the next higher order one point, a transfer-operating frame having operating parts for imparting motion to the transferring device, hand-operated devices for reciprocating the transfer-operating frame, a latch to intermittently connect the keyboard and transfer-operating frame whereby the former is moved by the latter, and a trip for releasing the latch after a given movement of the keyboard is made.

6. In an adding-machine, the combination of a series of sets of keys, a keyboard for said keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, means for moving the keyboard, and means to lock the keyboard against return movement until its full movement is completed in registering.

7. In an adding machine, the combination of a series of sets of keys, means to move the keyboard, a keyboard for said keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, a transfer operating frame having operating parts for imparting motion to the transferring device, hand-operated devices for reciprocating the transfer-operating frame, and means to lock the transfer-operating frame against return movement until its full movement is completed in registering.

8. In an adding machine, the combination of a series of sets of keys, means for supporting and reciprocating all of the keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, transferring devices controlled by the registering devices of one order to move the registering devices of the next higher order one point, and means acting after the direct action of the step-bars upon the registering devices to operate the transferring devices.

9. In an adding-machine, the combination of a series of sets of keys, means for supporting and reciprocting all of the keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, transferring devices controlled by the registering devices of one order to move the registering devices of the next higher order one point, a transfer-operating frame having operating parts for imparting motion to the transferring device, hand-operated devices for reciprocating the transfer-operating frame, and means to lock the transfer-operating frame against return movement until its full movement is completed in registering.

10. In an adding-machine, the combination of a series of sets of keys, means for supporting and reciprocating all of the keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, transferring devices controlled by the registering devices of one order to move the registering devices of the next higher order one point a transfer-operating frame having operating parts for imparting motion to the transferring device, hand-operated devices for reciprocating the transfer-operating frame, a shield controlled by the transferring devices to shield the numbers of the registering devices from view in case said transferring device becomes inoperative or fails to register, and means to lock the transfer-operating frame against return movement until its full movement is completed in registering.

11. In an adding-machine, the combination of a series of sets of keys, a series of registering devices respectively operated by said sets of keys, a single locking-piece for each set of keys extending longitudinally past all of the keys of a set movable by any key of a set and for locking each of said keys of a set in operative position, and a common releasing mechanism for simultaneously moving all of the locking-pieces of the several sets of keys.

12. In an adding-machine, the combination of a series of sets of keys, a reciprocating keyboard carrying said keys, a series of registering devices respectively operated by said sets of keys, a single locking-piece for each set of keys for locking the keys movable with said keyboard in operative position, a common releasing mechanism for simultaneously releasing all of the keys upon completing the registration and reciprocation of the keyboard, and hand-controlled means for throwing the common releasing mechanism out of action.

13. In an adding-machine, the combination of a series of sets of keys, a keyboard for said keys, a series of step-bars operated by the keys, a series of registering devices, connecting devices between the step-bars and respective registering devices, means for moving the keyboard, locking devices for each set of keys for locking the keys in operative position, and a common releasing mechanism for simultaneously releasing all of the keys upon completing the registration.

14. In an adding-machine, the combination of a series of sets of keys, a keyboard for said keys, a series of step-bars operated by the keys, a series of registering devices, connecting devices between the step-bars and respective registering devices, means for moving the keyboard, locking devices for each set of keys for locking the keys in operative position, a common releasing mechanism for simultaneously releasing all of the keys upon completing the registration, and means to lock the keyboard against return movement until its full movement is completed in registering.

15. In an adding-machine, the combination of a series of sets of keys, a keyboard for said keys, a series of step-bars operated by the keys, a series of registering devices, connecting devices between the step-bars and respective registering devices, means for moving the keyboard, transferring devices operated by the means for moving the keyboard and controlled by the registering devices of one order of numbers to move the registering devices of the next higher order one point, locking devices for each set of keys for locking the keys in operative position, a common releasing mechanism for simultaneously releasing all of the keys upon completing the registration, and means to lock the keyboard against return movement until its full movement is completed in registering.

16. In an adding-machine, the combination of a series of sets of keys, a series of registering devices operated by said keys, hand-operated devices for producing a reciprocation to all of the keys relatively to the registering devices, transferring devices adapted to move the registering devices one point with each operation of the registering devices, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, and a reciprocating transfer-operating frame having operating parts for imparting motion to the transferring devices and movable under the action of the hand-operated devices for causing the relative reciprocation of the keys with respect to the registering devices.

17. In an adding-machine, the combination of a series of sets of keys, a series of registering devices respectively operated by said sets of keys, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, a transfer-operating frame having operating parts for imparting motion to the transferring device, and means to lock the transfer-operating frame against return movement until its full movement is completed in registering.

18. In an adding-machine, the combination of a series of sets of keys, a series of registering devices respectively operated by said sets of keys, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, a transfer-operating frame having operating parts for imparting motion to the transferring device, and a shield controlled by the transferring devices to shield the numbers of the registering devices from view in case said transferring device becomes inoperative or fails to register.

19. In an adding-machine, the combination of a series of sets of keys, means for simultaneously reciprocating all of the keys in registering, a series of registering devices respectively operated by said sets of keys, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, a reciprocating transfer-operating frame having operating parts for imparting motion to the transferring device, locking devices for each set of keys for locking the keys in operative position, and a common releasing mechanism for simultaneously releasing all of the keys upon completing the registration.

20. In an adding-machine, the combination of a series of registering devices, key mechanism for operating the registering devices, means to reciprocate the key mechanism, transferring devices for moving the registering devices one point with each complete reciprocation of the key mechanism in the operation of registering, a trip controlled by the registering devices of the next lower order to put the transferring devices into operative position, and devices under the control and operating in conjunction with the means for reciprocation of the key mechanism for imparting motion to the transferring devices.

21. In an adding-machine, the combination of a series of registering devices, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, a transfer-operating frame having operating parts for imparting motion to the transferring device, hand-operated devices for reciprocating the transfer-operating frame, and means to lock the transfer-operating frame against return movement until its full movement is completed in registering.

22. In an adding-machine, the combination of a series of registering devices, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, a shield controlled by the transferring devices to shield the numbers of the registering devices from view in case said transferring device becomes inoperative or fails to register, a transfer-operating frame having operating parts for imparting motion to the transferring device, and hand-operated devices for reciprocating the transfer-operating frame.

23. In an adding-machine, the combination of a series of registering parts adapted to bring into view figures corresponding to the numbers added, a series of sets of keys carried in a keyboard, a series of step bars one to each set of keys acting as connecting mechanism between the keys and the registering devices for imparting a movement to said registering devices corresponding to the key or keys operated, means for imparting a relative movement between all of the keys and step-bars in registering printing devices for printing consecutively on a strip of paper the successive amounts which have been added, and connecting mechanism between the printing devices and the keys for operating the registering devices.

24. In an adding-machine, the combination of a series of registering devices, a series of reciprocating step-bars for operating the respective registering devices, a series of sets of keys one set for each step-bar in which each key of a set is adapted to cause the step-bar of that set to be moved to a definite and different distance, and means to impart a relative movement between the keys and the step-bar.

25. In an adding-machine, the combination of a series of registering devices, a series of step-bars for operating the respective registering devices, a series of sets of keys one set for each step-bar in which each key is adapted to move the step-bar to a definite distance, means to impart a relative movement between the keys and the step-bar, transfer devices connecting the several registering devices in pairs and controlled by the registering devices of the lower order of any pair, and means operating with the action of the keys for operating the said transferring devices.

26. In a transferring device for an adding-machine, the combination of two registering-wheels, one of which is provided with a ratchet-wheel and the other with a pin or projection, a pivoted lever having a pawl engaging with the ratchet-wheel, a spring to move the lever and pawl into operative position, a latch for holding the lever and pawl out of operative position adapted to be released by the pin or projection on the other registering-wheel, means for positively moving each of the registering-wheels, and hand-controlled means for operating the pivoted lever and pawl against the action of the spring to turn the ratchet-wheel.

27. In a transferring device for an adding-machine, the combination of two registering-wheels, one of which is provided with a ratchet-wheel and the other with a pin or projection, a pivoted lever having a pawl engaging with the ratchet-wheel, a spring to move the lever and pawl into operative position, a latch for holding the lever and pawl out of operative position adapted to be released by pin or projection on the other registering-wheel, means for moving each of the registering-wheels, means for operating the pivoted lever and pawl, keys to control the movement of the registering-wheels, a keyboard, means to move the keyboard, and connecting devices between the means for moving the keyboard and the means for operating the pivoted lever whereby the latter is caused to move after the operation of the former.

28. In a transferring device for an adding-machine, the combination of two registering-wheels, one of which is provided with a ratchet-wheel and the other with a pin or projection, a pivoted lever having a pawl engaging with the ratchet-wheel, a spring to move the lever and pawl into operative position, a latch for holding the lever and pawl out of operative position adapted to be released by pin or projection on the other registering-wheel, means for moving each of the registering-wheels, means for operating the pivoted lever and pawl, a sight-opening for reading the figures on the dials, and a shield controlled by the pivoted lever for closing the sight opening when it fails to complete its oscillation.

29. In an adding-machine, the combination of a series of sets of keys, a reciprocating keyboard for moving said keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, transferring devices controlled by the registering devices of one order of numbers to move the registering devices of the next higher order one point, means acting after the direct action of the step-bars upon the registering devices to operate the transferring devices and under the control of the means for reciprocating the keyboard, printing devices for printing consecutively on a strip of paper the successive amounts which have been added, and means forming a connection between the registering devices and the printing devices whereby the said parts operate simultaneously.

30. In an adding-machine, the combination of a series of sets of keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, a transfer-operating frame having operating parts for imparting motion to the transferring device, hand-operated devices for reciprocating the transfer-operating frame, printing devices for printing consecutively on a strip of paper the successive amounts which have been added, and connecting devices between the step-bars and the type of the printing devices whereby the step-bars simultaneously operate the registering devices and printing devices.

31. In an adding-machine, the combination of a series of sets of keys, a keyboard for said keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, means for moving the keyboard, means to lock the keyboard against return movement until its full movement is completed in registering, and printing devices under the control of the step-bars for printing consecutively on a strip of paper the successive amounts which have been added upon the registering devices.

32. In an adding-machine, the combination of a series of sets of keys, a keyboard for said keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, means for moving the keyboard, means to lock the keyboard against return movement until its full movement is completed in registering, a series of type-bars respectively connected with the several step-bars, impression devices for pressing the paper against the type-bars, and means for moving the step-bars and type-bars connected therewith not operated by the keys a short distance to bring the zero-type into printing operation upon the registering of a given amount upon the registering devices.

33. In an adding-machine, the combination of a series of sets of keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, transferring devices controlled by the registering devices of one order to move the registering devices of the next higher order one point, means acting after the direct action of the step-bars upon the registering devices to operate the transferring devices, a series of type bars respectively connected with the several step-bars, means to feed a paper strip under the type-bars, impression devices for pressing the paper against the type-bars, and means for moving the step-bars and type-bars connected therewith not operated by the keys a short distance to bring the zero-type into printing operation upon the registering of a given amount upon the registering devices.

34. In an adding-machine, the combination of a series of sets of keys, a series of step-bars operated by the keys, a series of registering devices respectively operated by the step-bars, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, means acting after the direct action of the step-bars upon the registering devices to operate the transferring devices, a series of type-bars respectively connected with the several step-bars, means to feed a paper strip under the type-bars, impression devices for pressing the paper against the type-bars, and means for moving the step-bars and type-bars connected therewith not operated by the keys a short distance to bring the zero-type into printing operation upon the registering of a given amount upon the registering devices.

35. In an adding-machine, the combination of a series of registering parts adapted to bring into view figures corresponding to the numbers added, a series of sets of keys carried in a keyboard, connecting mechanism between the keys and the registering devices for imparting a movement to said registering devices corresponding to the key or keys operated, printing devices for printing consecutively on a strip of paper the successive amounts which have been added, connecting mechanism between the printing devices and the keys for operating the registering devices, and means controlled by the registering mechanism for bringing into printing position the zero-type corresponding to the keys of the lower order of the series of sets of keys when no key of such set has been operated.

36. In an adding-machine, the combination of a series of sets of keys, a keyboard for said keys, a series of step-bars operated by the keys, a series of registering devices, connecting devices between the step-bars and respective registering devices, means for moving the keyboard, transferring devices operated by the means for moving the keyboard and controlled by the registering devices of one order of numbers to move the registering devices of the next higher order one point, locking devices for each set of keys for locking the keys in operative position, a common releasing mechanism for simultaneously releasing all of the keys upon completing the registration, means to lock the keyboard against return movement until its full movement is completed in registering, type-bars moved by the step-bars, a paper guide arranged adjacent to the type-bars, means to feed the paper intermittently, an impression device or hammer for pressing the paper toward the type, spring-actuated devices for operating the impression device, a lock controlling the spring-actuated devices, and devices under the control of the means for moving the keyboard for operating the lock to release the spring-actuated device whereby the printing operation takes place simultaneously with the registering operation.

37. In an adding-machine, the combination of a series of registering devices, transferring devices adapted to move the registering devices one point operated by a moving part of the machine with each operation, a trip controlled by the registering devices of the next lower order to put the transferring devices into action, a transfer-operating frame having operating parts for imparting motion to the transferring device, hand operated devices for reciprocating the transfer-operating frame, a series of type-bars respectively connected with the registering devices so as to be moved simultaneously therewith, impression devices for the type-bars, and connecting devices between the impression devices and transfer-operating devices whereby the printing is performed when the registration has been completed.

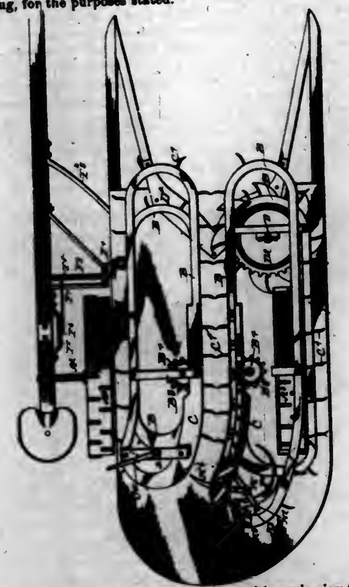
38. In an adding-machine, the combination of a series of sets of keys adapted to be depressed, a lock for each set of keys and common to all of the keys of a set adapted to lock any key depressed and hold it in its depressed condition and automatically release it upon depressing any other key of the set, registering devices, reciprocating hand-operated connecting means whereby the keys depressed are adapted to operate the registering devices, and a common releasing device for all of the locks of the several sets of keys controlled by the hand-operated connecting means whereby all of the keys may be simultaneously released.

39. In an adding-machine, the combination of a series of registering-wheels, a series of sets of keys for operating the several registering-wheels one set being adapted to control a single registering-wheel, transferring devices adapted to act upon the registering-wheels and be thrown into operative condition by the action of the registering-wheel of the next lower order, and hand-power devices for operating the transferring devices to positively move them in performing the act of registration as in carrying the maximum amount of one registering-wheel to the next registering-wheel of a higher order.

602,155. LUBRICATING APPARATUS. ALPHONSE CHIK, Paris, France. Filed Dec. 30, 1896. Serial No. 617,471. (No model.)

Claim.—In a mechanical oiling or lubricating apparatus the combination with a circular box having radial bores therein, and tubes or pipes seated in said bores, of two shafts one surrounding the other and concentric therewith penetrating into said box, a sector mounted on each of said shafts, within said box, two eccentric gears mounted oppositely, one on each of said shafts, a driving-shaft, eccentric gears thereon meshing with said first-mentioned gears whereby said first-mentioned shafts will be alternately accelerated and slackened, and the sectors made to alternately approach and separate, and means whereby said driving-shaft will be revolved, substantially as described.

602,156. NON-REFILLABLE BOTTLE. HERMAN C. FUHLHAGE, Edina, Ill. Filed Nov. 27, 1896. Serial No. 613,509. (No model.)

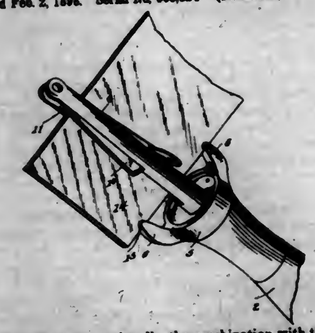


Claim.—1. The combination with the neck of a bottle having an annular groove, of a frangible cap provided with a socket adapted to receive the said neck, said cap being also provided with a recess opening into said socket and a spring secured within said socket and having an arm arranged within said recess, the lower end of said spring being bent inwardly to engage said groove, substantially as described.

2. The combination with the neck of a bottle having an annular groove, of a frangible cap provided with a socket to receive said neck, said cap being also provided with a vertical recess opening into said socket, a spring secured in said socket having a downwardly-projecting arm arranged within said recess, the lower end of said arm being bent inwardly to engage said groove, substantially as described.

602,157. CORN-HARVESTER. WILLIAM H. GRAY, Eddyville, Iowa. Filed Oct. 26, 1896. Serial No. 610,163. (No model.)

Claim.—1. In a corn-harvester or the like, the combination of a continuous hollow track having a laterally-enlarged portion at its inner rear end portion, a conveyer-chain of a length somewhat greater than the distance around the said track composed of a series of links of two kinds alternately arranged, the one having a flat top, two downwardly-projecting journals at its ends, a downwardly-projecting leg at its central portion, and a laterally-projecting arm, and the other having a flat under part two upwardly-projecting ends with openings to receive said journals and an upwardly-projecting central leg, and a sprocket-wheel to engage both the projections on the ends and the central portions of the links, substantially as and for the purposes stated.

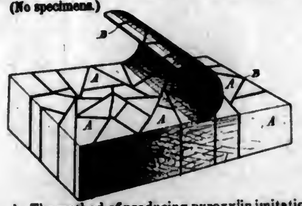


2. An endless conveyer-chain, composed of a series of links of two kinds alternately arranged, the one having a flat top, two downwardly-projecting journals at its ends, a downwardly-projecting central leg and a laterally-projecting arm, and the other having two raised ends with openings to receive the journals and a central upwardly-projecting lug, for the purposes stated.

3. In a corn-harvester the combination with mechanism for operating a binding-needle when the shock is formed, of an arm fixed to the shaft of the binding-needle, a roller on its end, a segmental channel-bar pivoted at one end to a fixed support and having said roller in its groove, a rock-shaft in the machine-frame, a crank-arm thereon, a rod connecting it with the free end of the channel-bar, two other crank-arms on said rock-shaft, rods connected therewith, guides attached to the ends of the rods, two continuous tracks and a conveyer-chain in each track of a length somewhat greater than the distance around the said track so that the chain will fold or kink at the end of the guide, substantially as and for the purposes stated.

4. In a corn-harvester, the combination of a continuous hollow track widened at its inner rear end portion, an endless conveyer-chain arranged to fold or kink at one point, a guide composed of a series of straight-edged links having lugs on their lower ends to project through a slot in the bottom of the track, a head on one link to extend diagonally across the track and permit the links to fold or kink at the end and means for operating the slides automatically, substantially as and for the purposes stated.

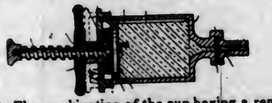
602,158. SAW-HANDLE. DAVID I. GREEN, Frontier, Mich. Filed Feb. 2, 1898. Serial No. 668,824. (No model.)



Claim.—1. In a saw-handle, the combination with the grip having a longitudinal bore, a shank extending through said bore and provided with two parallel arms at one end and adapted to embrace the sides of the saw, and a cam-lever pivoted between said ends and adapted to engage the saw and clamp it in position, substantially as set forth.

2. In a saw-handle, the combination with a grip having a longitudinal bore and a swivel-ring, a shank extending through said bore and having a screw-threaded connection with the grip, said shank being provided with parallel arms, and a lever pivoted between said arms and provided with a cam, substantially as set forth.

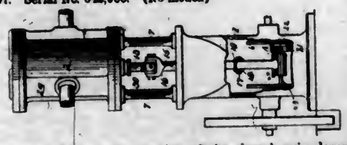
3. In a saw-handle, the combination with the grip having a longitudinal bore, a nut secured in said bore against rotation, a rubber packing confined between the nut and a shoulder in said bore, a shank extending through the bore and having one end screw-threaded to engage the nut and the other end bifurcated, a ring swiveled to the inner end of said grip, and a cam-lever pivoted between said bifurcated arms, substantially as set forth.



602,159. METHOD OF PRODUCING PYROXYLIN IMITATIONS OF MOSAIC. EDWIN D. HARRISON, Irvington, and CHARLES H. THURBER, East Orange, N. J., assignors to The Celluloid Company, New York, N. Y., a Corporation of New Jersey. Filed June 17, 1896. Serial No. 595,854. (No specimens.)

Claim.—1. The method of producing pyroxylin imitations of mosaics, consisting in, first, forming the pyroxylin compounds in pieces having small cross-sectional areas; second, coating all the surfaces of such pieces with a dyeing substance, and, third, welding the dyed pieces into blocks, shapes or masses, and subsequently cutting a sheet therefrom, substantially as described.

2. A method of producing pyroxylin imitations of mosaics, consisting in, first, forming the pyroxylin compounds into sticks or rods; second, coating all the surfaces of said sticks or rods with a dyeing substance; third, arranging said sticks side by side; fourth, welding said dyed sticks into a mass, and, fifth, cutting sheets from said mass, substantially as described.



602,160. CUP-LUBRICATOR. JOSEPH R. HOLMES, Elgin, Ill. Filed July 27, 1897. Serial No. 646,095. (No model.)

Claim.—1. The combination of the cup having a removable flat cap, the sleeve moving through said cap and provided with a stop at each end, a piston and a piston-rod, said piston and rod being adapted to be operated positively to discharge the entire contents of the cup independently of a spring and said sleeve having a handle and screw-thread connection with the rod and adapted to bear directly on the cap within the cup, and the spring situated in the cup and bearing on the cap near the upper plane of the cup and also bearing on the piston, substantially as described.

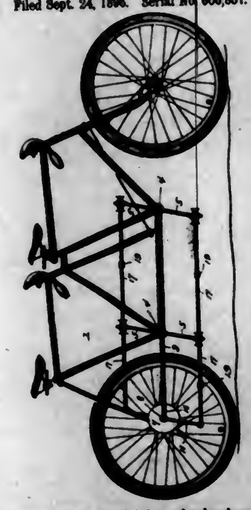
2. The combination of the cup having a removable flat cap, the sleeve movable through said cap and provided with a stop at each end, a piston and a piston-rod, said piston being keyed to the cup, and the piston and rod adapted to be operated positively to discharge the entire contents of the cup independently of a spring, and said sleeve having a handle and screw-thread connection with the rod and adapted to bear directly on the cap within the cup, and the spring situated within the cup and bearing on the cap near the upper plane of the cup and also bearing on the piston, substantially as described.

602,161. MOTIVE ENGINE. AUGUSTUS HOWARD, San Francisco, Cal., assignor to Willard Reed Green, Denver, Colo. Filed June 30, 1897. Serial No. 642,988. (No model.)

Claim.—1. In a motive engine of the class herein described, a cylinder provided with cylinder-heads having inlet and outlet ports therein, rotary distributing disks or valves, and a revoluble piston in said cylinder, connected with and driving said rotary distributing disks or valves by suitable mechanism, substantially as and for the purpose specified.

2. In a motive engine, a piston, a cylinder and heads therefor provided with ports or passages for induction and eduction of the working fluid, and rotary distributing disks or valves provided with ports or passages, said disks being rigidly connected by rods passing through the piston, substantially as and for the purpose specified.

3. In a motive engine, a cylinder and heads therefor provided with induction and eduction ports and passages, a revoluble piston connected with and operating rotary valve-disks in the ends of the said cylinder, a piston rod and a connecting-rod with a universal joint between, and means for positively turning the said rods and piston in accordance with the reciprocating movements of the engine, substantially as specified.



4. In a motive engine, a cylinder and heads therefor provided with induction and eduction ports and passages, rotary distributing disks or valves in the opposite heads, connected together and turning in one direction within the cylinder, and a revoluble piston, piston-rod and connecting-rod, the latter attached to the crank-pin bearing and turned positively by suitable mechanism in accordance with the reciprocating movements of the engine, substantially as specified.

5. In a motive engine, a cylinder, revoluble disks or valves in the ends thereof, induction and eduction ports or passages in the cylinder-head and corresponding ports in the revoluble disks or valves, with means for turning the said disks or valves positively and in accordance with the reciprocating movements of the engine, substantially as specified.

6. In a motive engine, a cylinder, and heads therefor provided with induction and eduction ports and passages, a revoluble piston, piston-rod and connecting-rod, turning in one direction, and distributing disks or valves mounted in the heads of the said cylinder, driven positively by gearing connecting them positively with the crank and crank-shaft, through said revoluble piston and rods, so as to move in accordance with the reciprocating movements of the engine, substantially as specified.

7. In a motive engine, having a cylinder, rotary disk valves in the ends thereof, a reciprocating piston, and piston rod, a means for rotating said rotary valves, consisting of a connecting-rod with universal-joint connection with the piston-rod, bearing on its lower end a spirally-toothed pinion meshing with and impelled by a scroll-toothed gear-wheel borne on the crank-disk concentric with the crank-pin, substantially as specified.

602,162. BICYCLE DRIVING-GEAR. WILLIAM S. KELLOGG, Little Rock, Ark. Filed Sept. 24, 1896. Serial No. 606,857. (No model.)

Claim.—1. In a bicycle, the driving-wheel axle carrying a pinion at its outer end, an internal gear journaled on the frame to mesh with said pinion, a crank rigid on the gear and a pedal-crank, combined with a revoluble member of a ball-race on the pedal-pin and the wrist-pin of the gear-crank respectively, the other members of the respective races being on the cranks, balls in each of the races, and a rod connecting the revoluble members of the ball-races, substantially as described.

2. In a bicycle, the driving-wheel carrying at each side a fixed spur-pinion, in combination with internal gears meshing therewith and each having a portion of its teeth cut away as described, cranks rigid on said gears, and operative connections between said cranks and similar cranks on the crank-axle, said connections having a ball-bearing engagement with the pedal-pins of the driving-cranks at the inner ends of the pedals, substantially as described.

602,163. PIGMENT FOR PAINTS. ALFRED B. KITTREDGE, Boston, and ARTHUR B. BROWNE, Cambridge, Mass., assignors of one-third to Charles M. Read, Boston, Mass. Filed May 21, 1894. Serial No. 512,000. (No specimens.)

Claim.—1. A paint comprising a base of non-crystalline magnetic oxid of iron, and a proper vehicle, as oil or japan, substantially as described.

2. A paint consisting of a base of spongy, friable, non-crystalline black magnetic oxid of iron, a coloring-matter, and a vehicle, combined to form a smooth and completely-mixed paint, substantially as described.

3. A paint comprising a base of non-crystalline spongy, friable magnetic oxid of iron in the form of an impalpable powder, and a vehicle, said vehicle being combined with said base so as to permeate every particle thereof, substantially as described.

602,164. BOOK-SUPPORT. JULIUS A. LOUSTEAU, Yonkers, N. Y. Filed June 24, 1897. Serial No. 642,573. (No model.)

Claim.—1. The combination of a book-rest, a supporting-rod therefor, a bracket for the supporting-rod in which the rod slides longitudinally, and means for locking the rod against rotation in the bracket by sliding it longitudinally therein in drawing the book-rest into its position for use, substantially as described.

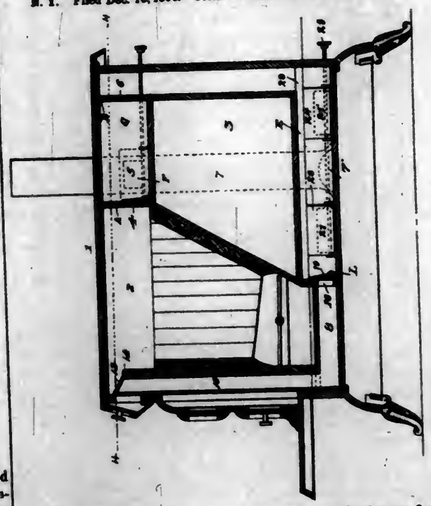
2. The combination of a book-rest, a supporting-rod therefor, a bracket for the supporting-rod in which the rod slides longitudinally, and guiding-faces on the rod and bracket to engage and hold the rod against rotation on sliding the rod longitudinally in the bracket in drawing the book-rest into its position for use, substantially as described.

3. The combination of a bracket having circular bearings therein and a guiding face, a book-rest, a rod mounted to slide and rotate in the bearings of the bracket and carrying the book-rest, whereby the latter can be slid in and turned down when not in use, and a guiding-face on the rod to engage the corresponding face on the bracket and hold the book-rest in position when it is slid out and turned up for use, substantially as described.

4. The combination with an intermediate cross-bar, of a connecting cross-bar carried thereby, pivoted arms supported from the intermediate cross-bar, and a side cover extending from the connecting-bar to the free ends of the pivoted arms, substantially as described.

5. The combination with an intermediate cross-bar, of a connecting cross-bar carried thereby, pivoted arms supported from the intermediate cross-bar, strips upon the ends of the pivoted arms forming supports for the lower edges of books placed thereon, and a side cover extending from the connecting cross-bar to the strips and permitting the book-rest thus formed to fold flat, substantially as described.

6. The combination with a book-rest and a book-guard pivoted to swing into and out of contact with a book on the book-rest, of a cam with a plurality of cam-faces attached to the book-guard, and a spring bearing on the same for throwing the book-guard toward a plurality of positions, so that it is thereby either held toward or away from the face of the book-rest or against the back thereof, substantially as described.



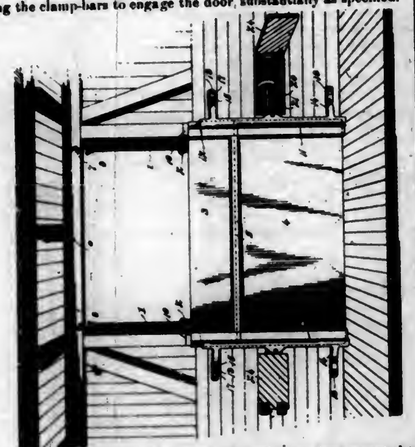
602,165. DRAWING-PEN. FRIEDRICH LUTTERBERG, Mittweida, Germany. Filed Oct. 13, 1897. Serial No. 655,093. (No model.) Patented in Germany Apr. 30, 1896, No. 92,219.

Claim.—1. In a drawing-pen the combination of limbs of unequal length, a movable blade having a pivot connecting it to the shorter limb, a fastening *d*, situated opposite the point of the pen with respect to pivot, and a set-screw to adjust the separation of said limbs, substantially as described.

2. In a drawing-pen the combination of limbs of unequal length, a movable blade pivoted to the shorter limb, a fastening *d*, a set-screw *e* between the pivotal connection of the movable blade with said limb and fastening, said blade having lateral slots to receive the set-screw and the fastening, substantially as described.

602,166. STOVE OR RANGE. HERBERT W. MASON, Glens Falls, N. Y. Filed Dec. 10, 1896. Serial No. 615,179. (No model.)

Claim.—A cooking stove or range, comprising the fire-pot 2, provided with a passage 8 located beneath said pot, vertical flues 10, 12, extending from the upper part of said fire-pot and communicating with said passage, dampers 13, 13, fixed on a common rod 14 and arranged to simultaneously control said flues in combination with the oven 3, the partitions A, B, extending from the top of the oven to the top plate of the stove and provided with the orifices C and D and the damper 4 arranged to control the orifice C, the longitudinal partitions 22 and 29, provided with the orifices 21. 21', and the orifice 26, the dampers 23, 24, fixed on the common rod 25 and adapted to simultaneously control said orifices 21, 21', and the damper 30 adapted to control the orifice 26, the transverse partition I extending between the sides of the stove and between the forward end of the oven and the bottom plate of said stove, and provided with the orifices 16 and 17, the dampers 19, 19', fixed on a common rod L, and adapted to simultaneously control said orifices 16, 17, the vertical flue 7 formed with the orifice 7', communicating with a passage beneath the oven and with an orifice F, communicating with a similar passage above said oven and a damper 5, adapted to control said orifice F, substantially as and for the purpose set forth.



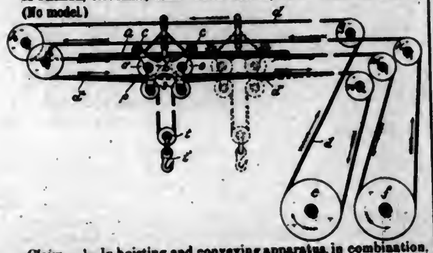
602,167. GRAIN-CAR DOOR. CHARLES L. NEWSTROM and THOMAS H. MILLER, Malden Rock, Wis. Filed Sept. 15, 1897. Serial No. 651,765. (No model.)

Claim.—1. The combination with parallel guide-rods, of a sectional car-door having its members provided with eyes mounted to slide upon said guide-rods, said members being of greater width than the car-door opening to bear against the inner surfaces of the sides of the frame, clamp-bars to engage and hold the edges of said car-door members in contact with the sides of the door-frame, and movable outwardly toward the same, and operating devices for moving the clamp-bars, substantially as specified.

2. The combination with guide-rods and a car-door mounted to slide upon said guide-rods and of greater width than the door-frame to bear against the inner surfaces of the sides thereof, clamp-bars cut away at their inner surfaces to form biting edges to bear against the inner surface of the door, and movable outwardly to force the door against the frame, and means for securing said bars in operative contact with the door, substantially as specified.

3. The combination with guide-rods and a car-door mounted to slide thereon, of clamp-bars adapted to engage the car-door contigu-

ous to its side edges, to hold the latter in contact with the inner surface of the car-door frame, said clamp-bars being pivotally mounted for lateral movement at their upper extremities, and means for operating the clamp-bars to engage the door, substantially as specified.



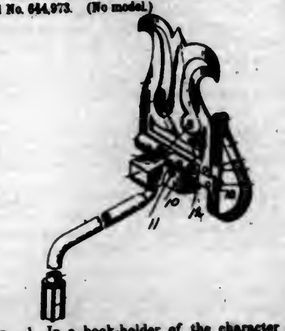
4. The combination with guide-rods and a car-door mounted to slide thereon, of clamp-bars adapted to engage a car-door and hold it in contact with the inner surface of the door-frame, said clamp-bars being provided with lateral arms respectively pivoted and having a slotted connection with the car-frame, and means for securing the clamp-bars in their adjusted positions, substantially as specified.

5. The combination with guide-rods and a car-door mounted to slide thereon, of clamp-bars adapted to engage and secure the car-door in contact with the inner surfaces of the door-frame, drums having flexible connections respectively with said clamp-bars, and means for securing the drums at the desired adjustment, substantially as specified.

6. The combination with a car-door arranged to terminally overlap the inner surfaces of a car-door frame, of clamp-bars for engaging and holding the car-door in contact with the frame, drums operatively connected with the clamp-bars and having exposed heads whereby they may be manipulated from without the car, and means for securing the drums at the desired adjustment, substantially as specified.

7. The combination with a car-door arranged to terminally overlap the inner surfaces of the door-frame, of clamp-bars adapted to engage and secure the door in contact with said surfaces, drums flexibly connected with the clamp-bars and having exteriorly-exposed heads provided with tool-seats, and locking-pawls for engaging ratchet-teeth on said heads, substantially as specified.

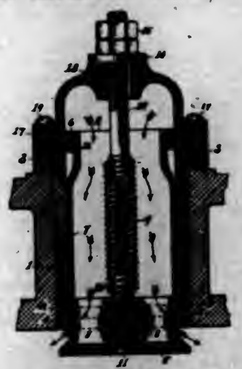
602,168. HOISTING AND CONVEYING APPARATUS. HERBERT R. PALMER, Cleveland, Ohio. Filed Dec. 15, 1897. Serial No. 661,942. (No model.)



Claim.—1. In hoisting and conveying apparatus, in combination, a track or way, a carriage mounted to travel on said way, and an endless cable driven and controlled by two independently-operated drums; said cable being supported, and connected with the said carriage, substantially as specified.

2. In hoisting and conveying apparatus, in combination, a track or way, a carriage mounted to travel on said way, an endless cable controlled by two independently-operated driving-drums and connected with the said carriage as set forth, and a hoisting-cable *p* rove through pulleys in the said carriage and secured to the driving-cable at opposite sides of said carriage, substantially as described.

3. In hoisting and conveying apparatus, in combination, a fixed way, a carriage mounted to travel reciprocally on said way, and provided with pulleys *o o'*, pulleys *h h'* located at one end of said way, pulleys *g*, *k*, *m* and *a* located at the opposite end of said way, and an endless cable controlled by two independently-driven drums, said cable being passed around the said pulleys, substantially as set forth.



602,169. BOOK-HOLDER. ALBERT L. PLATT, Clinton, Ill., assignor to the Clinton Book-Holder Company, same place. Filed July 17, 1897. Serial No. 644,973. (No model.)

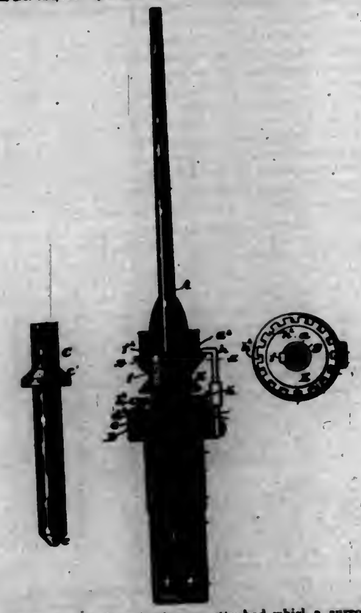
Claim.—1. In a book-holder of the character described, the combination with the socket having peripheral ribs, the rod having bent tapering ends, the leg having a tapering aperture and the pintle, of the plate formed with rounded lugs, the plate connected therewith by a set-screw, the curved back, the stationary fingers, and the pivoted spring-clamps, substantially as specified.

2. In a book-holder of the character described, the combination with the tapering socket, having peripheral ribs, the rod having bent tapering ends, the leg having a tapering aperture, and the transverse pintle, of the plate having curved lugs engaging with said pintle, the plate connected therewith by a set-screw, and formed with a curved flange engaging with said pintle, and with a depression at each end, the curved back, the fingers having rounded sides and the pivoted spring-clamp seated on said depression, substantially as specified.

602,170. AIR-VALVE. EDWARD A. RIX, San Francisco, Cal. Filed Aug. 18, 1897. Serial No. 648,712. (No model.)

Claim.—1. In air-inlet valve, a main shell or casing, an annular valve-shell sliding therein, a stop-collar around the outer end of the valve-shell and a positive stop-ring therefor, fitting into a recess in the outer end of the main shell and held by the valve-stem support, substantially as described.

2. In an air-inlet valve, a main shell or casing, a tubular valve-shell sliding therein, having at one end an integrally-formed stop flange or collar, and at the other end an integrally-formed valve-disk reinforced by integral radial wings, passages or apertures through the valve-shell between the said wings and just above the valve-disk, a positive stop for the collar, removably secured to the said main shell, a tension-spring attached to said valve-disk, and a revoluble stem supporting said spring and valve-shell, substantially as specified.



3. In an air-inlet valve a fixed or main shell, a sliding annular valve-body therein, a disk-valve integrally joined to the latter by curved vanes, with radial passages through the shell between said vanes, and an extensible helical spring centrally attached to said valve by a rigid connection, and attached also to a rotating stem at the upper end of said spring, whereby the valve is kept closed when not in action, substantially as described.

4. In an air-inlet valve, a main shell or casing, with means for removably attaching the same to an air-cylinder, a tubular valve-shell sliding therein, having at one end an integrally-formed stop flange or collar, and at the other end an integrally-formed valve-disk, reinforced by integral radial wings, passages or apertures through the valve-shell between the said wings and just above the valve-disk, a positive stop-ring 16 for the stop flange or collar, an open-sided support 13 removably attached to the main shell and securing the said stop-ring 16, a revoluble stem 12 sustained by the open support 13, and a tension-spring 9 attached to the said stem and to the valve-disk, whereby the latter is held closed when not in action, substantially as specified.

5. In an air-inlet valve a fixed main shell, a hollow or annular valve-shell sliding therein, a coiled extension-spring to hold the valve shut when not in action, an adjustable stem connecting to the spring and held by an open-sided support 13 attached to the end of the main shell, partially covering and securing the stop-ring 6, in the manner substantially as described.

6. An air-inlet valve comprising a main shell with means for removably attaching the same to an air-cylinder, a tubular valve-shell sliding therein, having at one end an integrally-formed stop flange or collar, and at the other end an integrally-formed valve-disk reinforced by radial wings, passages or apertures through the valve-shell between the said wings and just above the valve-disk, a removable stop-ring 16 for the stop flange or collar, an open-sided support 13 removably attached to the main shell and securing the said stop-ring 16, a revoluble stem 12 sustained by the open support 13, having adjusting-nuts 15, and a tension-spring 9, attached to the said stem and to the valve-disk, whereby the latter is held closed when not in action, substantially as specified.

602,171. SPINDLE-SUPPORT. EPPA H. RYDE, Waltham, Mass., assignor of one-half to A. M. Goodale, same place. Filed Feb. 20, 1897. Serial No. 624,201. (No model.)

Claim.—1. A bolster having an attached whirl, a surrounding support to receive said bolster, a spindle having its pintle within said bolster and means to connect the said whirl and bolster with the spindle in order that the latter may be rotated with the bolster and its whirl, and ball-bearings interposed between the said bolster and its supporting case near said whirl to constitute a rolling lateral bearing for the bolster, substantially as described.

2. A bolster having an attached whirl, means to sustain said bolster, a spindle having its pintle within said bolster, and means to connect the said whirl and bolster with the spindle in order that the latter may be rotated with the bolster and its whirl, and a packing interposed between said pintle and bolster, substantially as described.

3. A supporting-case, a bolster having at its exterior a tapered or inclined surface, a ring surrounding said bolster, rolling surfaces interposed between said ring and the tapered or inclined surface of the bolster, and a whirl connected with and to rotate the bolster, substantially as described.

4. A supporting-case, a bolster having at its exterior a tapered or inclined surface, a rolling surface to sustain the weight of said bolster, a ring surrounding said bolster, rolling surfaces interposed between said ring and the tapered or inclined surface of the bolster, and a whirl connected with and to rotate the said bolster, substantially as described.

5. The supporting-case, its notched ring, a bolster having an attached whirl, and a spindle provided with a flange independent of and located above said whirl, combined with a hook to overlap the said flange, and a movable lip to enter a notch in the said ring, substantially as described.

6. The bolster-case, a bolster therein provided near its upper end with an inclined or tapered surface, a whirl attached to said bolster, and a ring interposed between said tapered or inclined surface and the lower end of the whirl, combined with a series of balls or rolling surfaces interposed between said ring and said tapered or inclined surface, substantially as described.

7. A supporting-case, a spindle, a bolster having an inclined or tapered surface and rotated in unison with said spindle, combined with a ring mounted on the supporting-case and a series of balls interposed between said inclined or tapered surface of the bolster and said ring, substantially as described.

8. A supporting-case and a spindle, a bolster in which the pintle of the spindle is inserted loosely, means to connect said spindle and bolster that they may be rotated in unison with a suitable packing interposed between said bolster and spindle, substantially as described.

9. A supporting-case and a spindle, a bolster in which the pintle of the spindle is inserted loosely, means to connect said spindle and bolster that they may be rotated in unison, combined with a bearing in said supporting-case for the end of said bolster, and with a suitable packing interposed between said bolster and spindle, substantially as described.

602,172. SECONDARY BATTERY. FRIEDRICH W. SIEMENS, Triberg, Germany, assignor to the Elektrizitäts-Gesellschaft, Triberg, Gesellschaft mit Beschränkter Haftung, same place. Filed June 10, 1897. Serial No. 640,304. (No model.)

Claim.—1. In combination the supporting-frame consisting of the parallel perforated plates with the spacing-tubes *d* and connecting-bolts, and the electrodes consisting of the perforated tubes containing active material, said tubes being piled in the spaces between the plates and resting upon the spacing-tubes, substantially as described.

2. In combination the supporting-frame consisting of the parallel perforated plates of insulating material with the spacing-tubes *d* and connecting-bolts, and the series of electrode elements piled in the spaces between the plates and resting upon the spacing-tubes, substantially as described.

602,173. PLANTER. JAMES D. SCHOFIELD, Dallas, Tex. Filed Sept. 17, 1897. Serial No. 652,012. (No model.)

Claim.—1. In a planter, the combination with a hopper having a bearing, and a feed-disk mounted for horizontal rotation on the

bearing and provided with radial arms, of means for rotating the said feed-disk, and a vibratory feed device located in a slot in the hopper and having an upwardly-disposed end arranged in the path of and adapted to be struck and depressed by the said radial arms of the feed-disk.

2. In a planter, the combination with a hopper having a feed-slot, of a vibratory feed device fulcrumed between its ends in said slot, a cotton-feed, and means for alternately depressing the ends of said feed device.

3. In a planter, the combination with a hopper having a feed-slot, and a vibratory feed-plate having opposite end feed-openings and fulcrumed between its ends in said slot, of a feed-disk, means for rotating the same, and means for vibrating the feed-plate so as to alternately depress its ends and openings below the level of the feed-slot.

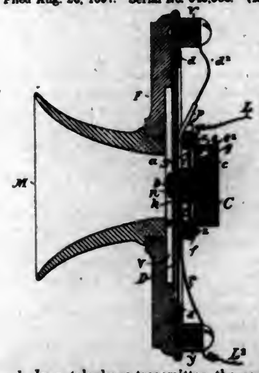
4. In a planter, the combination with a hopper the bottom of which is provided with a feed-slot, and a centrally-pivoted vibratory feed-plate having feed-openings at opposite sides of its center, of a feed-disk mounted for rotation in the hopper-bottom and provided with radial arms adapted to travel over said plate, and cam-lugs arranged on the feed-plate in the path of the arms of the feed-disk.

5. In a planter, the combination with a hopper having a feed-slot in its bottom, a vibratory feed-plate intermediately pivoted therein and provided with feed-openings near its opposite ends, and means for opening and closing the openings, of a feed-disk adapted to depress alternately the ends of the plate, and means for rotating said disk.

6. In a planter, the combination with a hopper having its bottom provided with a feed-slot, a centrally-pivoted vibratory feed-plate located therein and having openings near its ends, the edges of which are provided with upwardly-disposed cam-lugs, of a rotary feed-disk, and means for operating the same.

7. In a planter, the combination with a hopper the bottom of which is provided with a feed-slot, a feed-plate pivoted intermediately therein and provided with feed-openings, and a gage-plate located on the feed plate and adapted to overlap the feed-openings therein, of means for vibrating said feed-plate so as to depress its ends alternately below the bottom of the hopper, a feed-disk, and means for operating the same.

8. In a planter, the combination with a hopper having a feed-slot in the bottom at one side of its center, and bearings formed in the opposite edges of the same, a longitudinally-divided rock-shaft journaled therein, means for adjusting one of said shaft sections with relation to the other, a feed-plate having opposite openings mounted in the feed-slot and supported by the stationary section of the rock-shaft, and a gage-plate adapted to cover said openings carried by the adjustable section of the shaft, of means for depressing alternately the ends of the feed-plate, a feed-disk, and means for rotating the same.



9. In a planter, the combination with a hopper the bottom of which is provided with a feed-slot, a divided rock-shaft journaled intermediate the ends thereof, a feed-plate having opposite openings supported by the lower shaft-section, a gage-plate located on the feed-plate, cam-lugs carried by the feed-plate and gage-plate, and means for securing the shaft-sections in their adjusted positions, of a feed-disk having arms radiating therefrom and adapted to strike the cam-lugs alternately, and means for rotating the feed-disk.

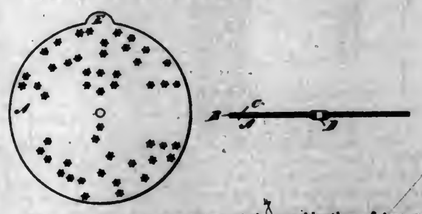
10. In a planter, the combination with the hopper the bottom of which is provided with a feed slot located at one side of its center, said slot having transversely-opposite bearings and terminating at its ends in inwardly-disposed depressed chutes, a feed-plate mounted for vibration in the feed-slot and journaled in the bearings and terminating at its ends in depending curved cut offs and provided at each side of its center with feed-openings, of a rotatable feed-disk journaled in the hopper, means for depressing alternately the ends of the feed-plate whereby their feed-openings are brought opposite the lower ends of the chutes, and means for rotating the feed-disk.

11. In a planter, the combination with the hopper the bottom of which is provided with a feed-slot located at one side of its center, said slot having transversely-opposite bearings and terminating at its ends in inwardly-disposed depressed chutes, a feed-plate mounted for vibration in the feed-slot and journaled in the bearings and terminating at its ends in depending curved cut offs and provided at each side of its center with feed-openings, of cam-lugs located at opposite sides of the center of the feed-plate, a rotatable feed-disk mounted in the bottom of the hopper and provided with radiating arms adapted to strike said lugs successively, and means for rotating said feed-disk.

12. In a planter, the combination with the hopper-wall, a ring located therein and a disk supported below and by the ring and having an annular track, the ring being provided with a curved slot at one side, the ends of the slot terminating in depressed chutes, a rotatable feed-disk located on the track and having arms radiating from its upper edge and a lower toothed periphery, and gearing for engaging the teeth and driving the feed-disk, of a vibratory feed-plate located in the feed-slot and having feed-openings, and lugs located on the plate in the path of and adapted to be successively struck by the radiating arms of the feed-disk.

602,174. TELEPHONE-TRANSMITTER. HERBERT R. SHELDEN, Boston, Mass., assignor to the American Bell Telephone Company, same place. Filed Aug. 26, 1897. Serial No. 649,900. (No model.)

Claim.—1. In a telephone-transmitter, the combination of the vibratory diaphragm, and front and back electrodes both mounted thereon, the former being rigidly, and the latter elastically attached thereto; with a variable-resistance medium composed of substantially spherical or rounded carbon granules or particles, held between and in constant contact with the said electrodes; substantially as specified.

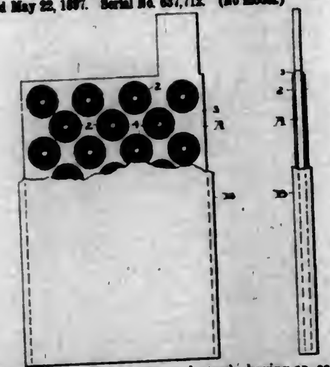


2. In a telephone-transmitter, the combination with the vibratory diaphragm, a case or chamber elastically attached to the said diaphragm and wholly supported thereby, and two electrodes having adjacent contact-surfaces, inclosed in said case, one being mounted directly on the diaphragm and the other on the back of the case; with a variable-resistance medium constituted of spherical or rounded particles of granulated carbon held between the said electrodes, within the said chamber; substantially as set forth.

3. The combination in a telephone-transmitter, with a diaphragm carrying both electrodes, one mounted directly thereon, and the other through an interposed elastic arm or plate, of a mass of granular carbon held between and in contact with the said electrodes to constitute a variable-resistance medium, the grains or particles of carbon being spherical or rounded in form; substantially as set forth.

4. In a transmitting-telephone of the granular-carbon type, the combination with the diaphragm, of a case or chamber containing the electrodes, supported on the said diaphragm, and provided with a spring-back forming or carrying one of the said electrodes, the other being attached directly to the diaphragm, and a mass of rounded or substantially spherical carbon granules or particles held between the said electrodes within the said case; substantially as described.

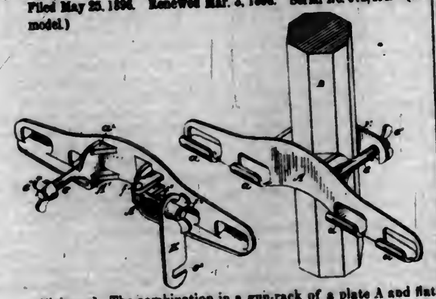
5. In a transmitting-telephone of the granular-carbon type, the combination of the diaphragm, a resilient or elastic disk or plate secured centrally thereto, a containing case or chamber supported on the spring edges of the said plate and closed thereby, and a variable-resistance medium contained within the said chamber and consisting of a front electrode directly secured to the diaphragm, a complementary electrode carried upon the rear wall of said chamber, and spherical or rounded carbon granulations held between the said electrodes; substantially as specified herein.



602,175. PUZZLE. JOSEPH T. SMITH, London, England. Filed July 31, 1897. Serial No. 646,688. (No model.)

Claim.—1. A puzzle, consisting of the combination of two or more relatively movable sheets of material, the front sheets being transparent, and all the sheets being secured together, and certain of the sheets having portions of a given complete design, said portions being so arranged that in one position of the sheets relatively to each other, the said portions on all the sheets unite to form a word or words or an easily-recognizable portrait, figure, or the like, while in all other relative positions of the sheets, no word or words, portrait, figure or the like is formed.

2. A puzzle consisting of the combination of a disk A, provided with a projection E, and having representations of certain parts of letters; a second transparent disk B, having a projection E and having representations of other parts of the same said letters, a third transparent disk C, having a projection E, and having representations of the remaining parts of the same said letters, and an eyelet D securing loosely together the three said disks at their center, as and for the purpose set forth.



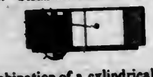
602,176. STORAGE BATTERY. GEORGE A. WASHBURN, Cleveland, Ohio, assignor to the Ohio Storage Battery Company, same place. Filed May 22, 1897. Serial No. 637,712. (No model.)

Claim.—1. A storage-battery electrode having on each side a series of groups of concentric ring-shaped projections of substantially uniform cross-section one with the other and equally spaced at all points to hold active material between them and standing out above the adjacent surface of the plate, and a hole centrally through each group communicating with the opposite side of the plate, substantially as described.

2. An electrode for storage batteries, consisting of a metallic plate having its surface provided with separate and distinct groups of circular projections, said projections similar in depth and cross-section from edge to base and integral with the plate and equally spaced at all points, active material filling the space between said projections, and the space outside of said projections between the groups being without active material, substantially as described.

602,177. GUN-RACK. LOCHIE M. WILES, Philadelphia, Pa. Filed May 25, 1896. Renewed Mar. 3, 1898. Serial No. 672,461. (No model.)

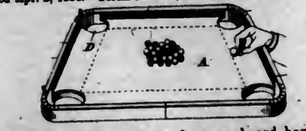
Claim.—1. The combination in a gun-rack of a plate A and flat hooks projecting therefrom adapted to engage with the swivel of a gun, so that the gun can be suspended therefrom, and will be prevented from swinging laterally thereon by the snug fit of the hook, with a clamp for securing the plate to the pole.



2. The combination in a rack for suspending guns, of a plate A having projecting hooks adapted to receive the swivel of a gun and having lugs at the back fitting the pole and screw-threaded bolts projecting from the lugs one of said bolts being pivoted to its lug, with a plate adapted to rest back of the pole and nuts for confining the plate against the pole, substantially as described.

3. The combination in a gun-rack, of a plate A having two flat hooks projecting outwardly from the plate at each side of the center to which the stacking-swivel of a gun is adapted to be attached, and will be prevented from swinging laterally thereon by the snug fit of the hook, with a clamp for securing the rack to a pole, the hooks being so arranged in respect to the pole that the guns will swing clear of it, substantially as described.

4. The combination in a gun-rack, of a plate A having hooks and having a projection below the hooks for holding the gun clear of the canvas of the tent, with means for attaching the rack to the tent-pole, substantially as described.



5. The combination in a gun-rack, of a plate, means for securing the plate to the pole, flat hooks projecting from the face of the plate and adapted to fit snugly into the stacking-swivel of a gun so that the gun will be suspended from the hooks and will be prevented from swinging laterally thereon by the snug fit of the hooks, substantially as described.

602,178. SOCKET-BOLT. EMILE L. A. CURRAU, East Orange, N. J. Filed June 23, 1897. Serial No. 641,951. (No model.)

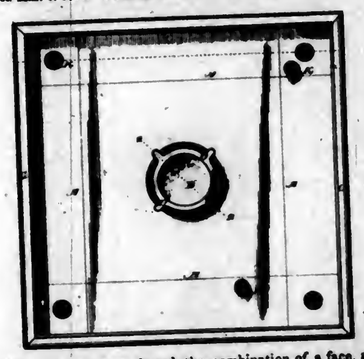
Claim.—The combination of a cylindrical socket having exterior lines of barbs and closed at one end, the said closed and being formed with a slot having a central enlargement with opposite extensions of less width than the said enlargement, the opposite end of the said socket being open and unobstructed, a bolt movably fitted in the said socket and comprising an outer head and a shank extending therefrom reduced near its free end and terminating in a barb wider at its outer terminations than at the point connected to the said shank and adapted to be passed through the said slot having the central enlargement and opposite extensions, and a coil-spring surrounding the reduced part of the bolt and standing flush with the remaining portion of the shank said spring being held between the shoulder formed on the bolt by reducing a portion thereof and the partially-closed end of the socket in which the slot is formed, substantially as described.

602,179. GAME-BOARD. HENRY L. HASKELL, Ludington, Mich. Filed Apr. 2, 1896. Serial No. 585,854. (No model.)

Claim.—1. The combination of a game-board having a face, a rim projecting above the face, a cushion on the rim, a base-line on each side of the board extending across the board from the innermost portion of a pocket-opening to the corresponding portion of the opposite pocket-opening, and yielding pockets outside the base-line, with sets of disks adapted to be grouped about the center of the face, and a disk adapted to be snapped from a base-line to impel the other disks into the pockets either directly or by the deflecting action of the cushion, substantially as described.

2. In a game-board, the combination of a face, a rim, a cushion on the rim, a series of pockets, the corners bearing the pockets having recesses let into them in the plane of the cushion and the face, substantially as described.

3. In a game-board the combination of a face, a series of pockets, a rim forming the outer boundary of each pocket and having a central recess for each pocket extending above and below the plane of the face of the board and adapted to receive the impact of the playing-disk and deflect the same into the bottom of the pocket, substantially as described.



4. In a game-board the combination of a face, a rim, a series of pockets, a central recess in the rim for each pocket curved in all directions and extending above and below the plane of the face of the board and a pocket of felt or similar material hung loosely in front of the said recess, whereby the impact of the playing-disk may carry the loose material before it into the recess and the disk be deflected into the bottom of the pocket, substantially as described.

5. In a game-board the combination of a face, a rim projecting above and below the face, openings in the face for pockets, pockets, each secured to the top of the rim, and an adjustable wire held in the rim and securing each pocket below the face, substantially as described.

6. In a game-board the combination of a face, a rim, openings

in the face for pockets, a groove in the rim for each pocket below the face, a wire secured by each groove and encircling the openings, and pockets held about the openings by the wires, substantially as described.

602,180. GAME-BOARD. HENRY L HASKELL, Ludington, Mich. Filed Mar. 6, 1897. Serial No. 626,281. (No model.)

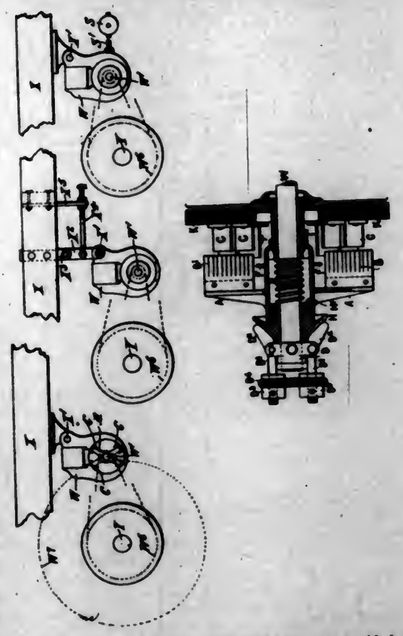
Claim.—1. In a game-board, the combination of a face, a central pocket-opening, a frame supported by posts on the face and surrounding the pocket-opening, a curtain depending from the frame and guarding the pocket-opening, a bottom for the pocket and means for securing the posts of the frame and the bottom of the pocket, substantially as described.

2. In a game-board, the combination of a face, a projecting rim, lines running parallel with the rim and crossing near the corners to form squares, depressions in the said squares, and a central pocket having an opening guarded by a curtain, substantially as described.

3. In a game-board, the combination of a face, a projecting rim, base-lines, corner-pockets, and a central opening in the face forming the mouth of a pocket, a frame projecting above the face and a flexible curtain hung from the frame and depending within the mouth of the pocket, substantially as described.

4. In a game-board, the combination of a face, a projecting rim, corner-pockets, a central opening in the face forming the mouth of the pocket a frame projecting from the face and surrounding the mouth of the pocket, a curtain hung from the frame and extending into the mouth of the pocket, a fabric forming a bottom for the pocket, a set of legs supporting the frame and passing through the face of the board, and means for securing the legs and the bottom of the pocket to the board, substantially as described.

5. In a game-board, a face, a series of base-lines and a pocket between the base-lines for the retention of surface projectiles, having a curtain or fringe suspended above and encircling the inner side of the pocket-opening, substantially as described.



6. In a game-board, the combination of a face, base-lines, a pocket within the base-lines, a frame above the pocket, and a curtain or fringe depending from the frame into the mouth of the pocket, substantially as described.

602,181. MEANS FOR CONNECTING HUBS, COUPLINGS, OR THE LIKE TO SHAFTS. GEORGE C. HOWARD, Wallingford, Pa. Filed Feb. 9, 1897. Serial No. 622,660. (No model.)

Claim.—The combination of the shaft having the sets of peripheral, similar, eccentric, wedge-like projections, the two projections constituting a set being struck on different centers and in opposite directions from their highest points, and the hub or coupling having the series of interval depressions complementary to said projections; the construction and arrangement being substantially as set forth whereby the surfaces of said projections and depressions, respectively, are adapted to frictionally cohere and bind and tighten upon each other when the hub or coupling, or the shaft, is turned in either direction.

602,182. DYNAMO FOR ELECTRIC-CAR-LIGHTING SYSTEMS. EDWIN J. PRESTON and ARTHUR B. GILL, London, England, assignors to J. Stone & Co., same place. Filed Feb. 26, 1895. Serial No. 539,618. (No model.) Patented in England Mar. 17, 1894, No. 5,031, and Nov. 26, 1895, No. 1,611; in France Jan. 17, 1895, No. 244,494; in Belgium Jan. 17, 1896, No. 113,673; in Germany Jan. 19, 1895, No. 92,705; in Switzerland Feb. 6, 1895, No. 9,976; in Italy Mar. 31, 1896, No. 38,175; in Brazil Apr. 24, 1895, No. 1,949; in Austria Apr. 30, 1895, No. 45 / 1,831; in Canada Oct. 3, 1895, No. 50,161; in Hungary Nov. 3, 1895, No. 4,238; in Victoria Dec. 7, 1895, No. 12,735, and in India Dec. 27, 1895, No. 77.

Claim.—1. The combination with the driving-axle provided with a pulley, of a dynamo provided with a pulley and mounted to be capable of movement toward and from the driving-axle in a substantially horizontal direction, a driving-belt applied to said pulleys, and means whereby the dynamo is pressed away from the driving-axle and the pressure is applied to the belt which is necessary for producing the desired normal speed of the dynamo, while the dynamo is drawn toward the axle by an increased speed of the belt, thereby loosening the belt and causing a slip which neutralizes each increase of speed, thus maintaining the desired normal speed of the dynamo-shaft under an excessive speed of the driving-axle, substantially as set forth.

2. The combination with the driving-axle provided with a pulley, of a dynamo provided with a pulley, a substantially horizontal driving-belt applied to said pulleys, and a cone-sided suspension device supporting the dynamo and causing the same to swing away from the driving-axle and tighten the belt for producing the desired normal speed of the dynamo, while permitting the dynamo to be drawn toward the driving-axle by an increased speed of the belt, substantially as set forth.

3. The combination with the driving-axle provided with a pulley, of a dynamo provided with a pulley, a substantially horizontal driving-belt applied to said pulleys, a cone-sided suspension device supporting the dynamo and causing the same to swing away from the driving-axle and tighten the belt for producing the desired normal speed of the dynamo, while permitting the dynamo to be drawn toward the driving-axle by an increased speed of the belt, and means for altering the tension of the belt, substantially as set forth.

4. The combination with a railway-carriage or other vehicle, of a dynamo in one-sided suspension from the under side thereof, pulley-and-belt connection between the shaft of the dynamo and one of the vehicle-axles, the belt being in about a horizontal direction, said dynamo acting as a tension device for the belt, and means for shifting the point of suspension of the dynamo and thereby altering the tension of the belt.

5. The combination with a dynamo and its switchboard provided with two pairs of contacts and electric circuits leading therefrom, of a reversible contact-lever adapted to connect either pair of contacts and mounted loosely on the dynamo-shaft to be shifted from one pair of contacts to the other by the reversal of the direction of rotation, said lever being also capable of movement lengthwise on the dynamo-shaft for engagement with and disengagement from said contacts, and a centrifugal governor mounted on the dynamo-shaft and connected with said contact-lever to hold the latter in engagement with the contacts of the switchboard during the rotation of the dynamo-shaft and to withdraw the lever from said contacts as the rotatory speed falls, preparatory to shifting the lever to the other pair of contacts by the reversal of the rotation, after which the contact-lever is again moved into engagement with the contacts by the increase of the rotatory speed, substantially as set forth.

6. The combination with a vehicle, a dynamo pivotally suspended from the under side thereof, pulley-and-belt connection between the dynamo-shaft and one of the vehicle-axles, said dynamo performing the function of a belt-tightener, suitable contacts on the dynamo-framing, electric circuits leading from said contacts to the brushes, the battery and lamps or other current-receivers, and a rocking switch-lever loose on the dynamo-shaft; of a centrifugal governor controlled by the rotation of the dynamo-spindle, and controlling the switch-lever thereon, substantially as and for the purpose set forth.

7. The combination with a vehicle, a dynamo pivotally suspended therefrom, pulley-and-belt connections between the dynamo-shaft and one of the vehicle-axles, said dynamo performing the function of belt-tightener, suitable contacts and stops on the dynamo-framing, electric connections between said contacts and the dynamo-brushes, the battery and lamps or other current-receivers, and a rocking switch-lever loose on the dynamo-shaft and provided with suitable contacts adapted to cooperate with those on the dynamo-framing; of a centrifugal governor, also on the dynamo-spindle, provided with a retractile spring, said governor connected with the switch-lever and operating to automatically separate its contacts from those on the dynamo framing so soon as the dynamo-shaft ceases to revolve, for the purpose set forth.

8. The combination with the dynamo and its spindle, suitable contacts on the dynamo-framing, electric circuits including said contacts and the dynamo-brushes, suitable stops on said dynamo-framing, and a switch-lever loosely mounted on the dynamo-shaft; of a centrifugal governor on said shaft provided with a retractile spring, said governor connected with the switch-lever and operating to move the same so as to interrupt the electric circuits when the dynamo-shaft ceases to revolve and to position the said lever to reverse the direction of the current when the motion of the dynamo-shaft is reversed, for the purpose set forth.

9. The combination with the dynamo and its spindle, suitable contacts on the dynamo-framing, a battery, electric circuits leading therefrom to said contacts and to the dynamo brushes, suitable stops on said dynamo-framing, and a switch-lever loosely mounted on the dynamo-shaft; of a centrifugal governor on said shaft provided with a retractile spring, said governor connected with the switch-lever and operating to move the same so as to interrupt the electric circuits when the dynamo-shaft ceases to revolve and to position the said lever to reverse the direction of the current when the motion of the dynamo-shaft is reversed, for the purpose set forth.

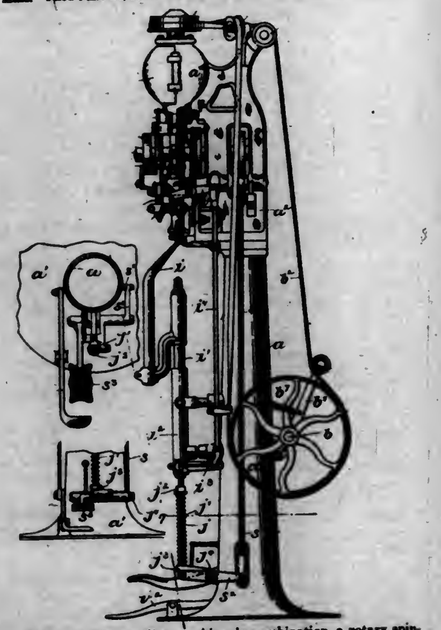
10. The combination of a dynamo, the brushes P, P', a rocking switch-lever A mounted freely on its shaft and provided with contact-plugs B, B' and cone-sleeve H, contacts C^+ C^- C^s C' and C^2 and stops on the dynamo-framing, electrical circuit connections therefrom to the brushes, a suitable current-receiver, the centrifugal governor D, D', $D^\times$ with spring O and the cone-sleeve H against which the governor-arms $D^\times$ act, substantially as and for the purpose set forth.

11. The combination of a dynamo, the brushes P, P', a rocking switch-lever A mounted freely on its shaft and provided with contact-plugs B, B', and cone-sleeve H, contacts C^+, C^- C^s C' and C^2 and stops on the dynamo-framing, electrical circuit connections therefrom to the brushes, the battery M and the lamp N, the centrifugal governor D, D', $D^\times$, with spring O and the cone-sleeve H against which the governor-arms $D^\times$ act, substantially as and for the purpose set forth.

12. The combination of the dynamo, the switch-lever A with contact plugs B B' and cone-sleeve H, contacts C^+ C^- C^s C' and C^2 and stops, the centrifugal governor D, D' $D^\times$ with spring O, the lever E, contacts G and resistance L, and electrical circuit connections between the latter, a suitable current-receiver, the brushes P P' and the aforesaid contacts C, substantially as set forth.

13. The combination of the dynamo, the switch-lever A with contact-plugs B B' and cone-sleeve H, contacts C^+ C^- C^s C' and C^2 and stops, the centrifugal governor D, D' $D^\times$ with spring O, the lever E, contacts G and resistance L, and electrical circuit connections between the latter, the battery M, the brushes P, P' and the aforesaid contacts C, substantially as set forth.

602,183. SHEET-METAL BOBBIN. JAMES A. BUCKLIFF, Blackburn, England, assignor to himself, and George Paley, Preston, England. Filed Feb. 25, 1898. Serial No. 671,856. (No model.)



Claim.—1. A bobbin comprising a number of sheet-metal thimbles or pans having their adjacent ends secured one within the other and each having an internal strengthening flange or ring, substantially as described.

2. A sheet-metal bobbin comprising a number of thimbles or pans having their adjacent ends secured one within the other and each formed with an internal inwardly-extending strengthening-flange bent to a more or less tubular shape, substantially as described.

3. A bobbin comprising a number of stamped sheet-metal thimbles or pans each having one of its ends reduced in diameter and provided at that end with an inwardly-projecting flange bent to a tubular shape, the reduced end of one thimble or pan being secured in the unreduced end of the next adjacent thimble or pan, substantially as described.

4. The improved bobbin comprising a number of stamped sheet-metal thimbles or pans each having one of its ends reduced in diameter and provided at that end with an inwardly-projecting flange bent to a tubular shape, the reduced end of one thimble or pan being secured in the unreduced end of the next adjacent thimble or pan and a wooden top and a wooden bottom each carried by a sheet-metal sheath secured to the end of the adjacent thimble or pan, substantially as described.

602,184. MACHINE FOR NAILING SOLES TO UPPERS. ORRELL ASHTON, Lawrence, Mass., assignor to James W. Brooks, principal trustee, Peterham, and F. F. Stanley, associate trustee, Boston, Mass. Filed June 24, 1897. Serial No. 642,101. (No model.)

Claim.—1. In a nailing-machine, in combination, a rotary spindle, and means for feeding the wire therethrough comprising loosely-mounted rolls arranged to roll over the wire when moved in one direction and to grip it between them when moved in the other direction.

2. In a nailing-machine in combination, a rotary spindle, and means for feeding a threaded wire therethrough comprising oppositely-arranged loosely-mounted toothed rolls arranged to roll over the wire when moved in one direction and to grip it when moved in the other direction, and means for supporting and reciprocating said rolls.

3. In a nailing-machine, in combination, a rotary spindle, and means for feeding the wire therethrough consisting of a reciprocatory sleeve rotatable with the spindle, serrated rolls, and means for supporting said rolls on said sleeve, said means being constructed and arranged to permit the rolls to pass over the wire when moved in one direction, and to positively grip and feed the wire when moved in the other direction.

4. In a nailing-machine, in combination, a rotary spindle, and means for feeding the wire therethrough consisting of a reciprocatory sleeve rotatable with the spindle, a series of coacting serrated rolls, and friction-blocks for said rolls, supported by the sleeve.

5. In a nailing-machine, in combination, a rotary spindle, and means for feeding the wire therethrough, consisting of a reciprocatory sleeve rotatable with the spindle, a series of loose serrated wire-feeding rolls, and a friction-block for each roll pivoted on the said sleeve.

6. In a nailing-machine, in combination, a rotary spindle, and means for feeding the wire therethrough, consisting of a reciprocatory sleeve rotatable with the spindle, a series of loose serrated wire-feeding rolls, and a friction-block for each roll pivoted on the said sleeve, the axes of movement of the friction blocks being out of the plane of the axes of the rolls.

7. In a nailing-machine, in combination, a rotary spindle, and means for feeding the wire therethrough, consisting of a reciprocatory sleeve rotatable with the spindle, a series of loose serrated wire-feeding rolls, a friction-block for each roll pivoted on the said sleeve, and springs for thrusting the rolls into engagement with the wire.

8. In a nailing-machine, in combination, a rotary spindle, and means for feeding the wire therethrough, consisting of a reciprocatory sleeve rotatable with the spindle, a series of loose serrated wire-feeding rolls, a friction-block for each roll pivoted on the said sleeve, and spring-held means for thrusting the rolls into engagement with the wire.

9. In a nailing-machine, in combination, a rotary spindle, means for feeding the wire therethrough, and means for checking a backward movement of the wire comprising spring-pressed serrated rollers.

10. In a nailing machine, in combination, a rotary spindle, means for feeding the wire therethrough, and means for checking a backward movement of the wire comprising serrated rollers and friction-blocks for said rollers.

11. In a nailing-machine, in combination, a rotary spindle, means for feeding the wire therethrough, and means for checking a backward movement of the wire comprising serrated rollers and spring-pressed friction-blocks arranged to permit the rolls to rotate in one direction only.

12. In a nailing-machine, in combination, a rotary spindle, means for feeding the wire therethrough, and means for checking a backward movement of the wire comprising serrated rollers, friction-blocks for said rolls, and a collar on said spindle having springs bearing against said friction-blocks.

13. In a nailing-machine, in combination, a rotary spindle having a through-aperture, friction-blocks inserted in said aperture, coacting serrated rolls supported by the blocks, a collar on said spindle, and springs supported by said collar and bearing against the friction-blocks.

14. In a nailing-machine, in combination, a rotary spindle having an aperture in its lower end, a cylindrical throat-piece inserted in said spindle and having a projecting end, a reciprocatory sleeve, and feeding-rolls supported by said sleeve and projecting through slots in the throat-piece and spindle to grip the wire.

15. In a nailing-machine, in combination, a spindle, means for feeding wire therethrough, a roll supported by the spindle, and having friction-rims, spring-pressed friction brake-shoes bearing against said friction-rims to retard the rotation of the reel and a spring connecting said shoes.

16. In a nailing-machine, in combination, a spindle, means for feeding wire therethrough, a yoke connected with the spindle, a wire-reel supported in the yoke, and a journal-pin headed at one end and threaded at said end to engage the yoke.

17. In a nailing-machine, in combination, a rotary spindle, a reciprocatory sleeve having means for feeding the wire through the spindle, a transversely-arranged rotary shaft having a cam, a reciprocatory shaft arranged parallel to the spindle, an arm carried by said reciprocatory shaft and having cheeks or lugs embracing said cam, a roller on said arm, and means for connecting said reciprocatory shaft with said sleeve.

18. In a nailing-machine, in combination, a spindle, means for feeding the wire through the spindle, a reciprocatory shaft from which motion is transmitted to the feeding means, means for reciprocating said shaft, and mechanism for controlling the movements of said shaft, comprising a locking-stop and a foot-lever fulcrumed at the base of the machine and connected to said stop.

19. In a nailing-machine, in combination, a spindle, means for feeding the wire through the spindle, a reciprocatory shaft from which motion is transmitted to the feeding means, means for reciprocating said shaft, and mechanism for controlling the movements of said shaft comprising a sliding stop, a vertically-acting wedge to engage said stop, and a lever connected to said wedge.

20. In a nailing-machine, in combination, a spindle, means for feeding the wire therethrough, a reciprocatory shaft for operating the wire-feeding means, an arm on said shaft having a roller, and mechanism for controlling said shaft comprising a spring-held sliding stop, a wedge to engage the stop, a connecting-rod, and a treadle to operate as described.

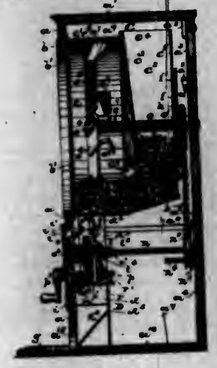
21. In a nailing-machine, in combination, a reciprocatory toothed feed-lever, a lever for moving the feed-lever in one direction, an arm adjustably connected to the said lever for moving said feed-lever in the other direction, and two cams for acting on the said lever and the arm connected therewith.

22. In a nailing-machine, in combination, a reciprocatory toothed feed-lever, a two-armed lever for moving the feed-lever positively in each direction, cams for acting on said arms alternately, and means for limiting the degree of movement of the said two-armed lever.

23. In a nailing-machine, in combination, a reciprocatory toothed feed-lever, a two-armed lever for moving the feed-lever positively in each direction, cams for acting on said arms alternately, means for adjusting one of said arms relatively to the other, and an adjusting-screw for limiting the degree of movement of the said two-armed lever.

24. In a nailing-machine, in combination, a reciprocatory horn, a vibrating lever, and a clutch mechanism having a laterally-movable member for connecting the lever and horn only when the horn is partially depressed.

25. In a nailing-machine, in combination, a reciprocatory horn, a vibrating lever, a rod connected with the horn and having a rack, a stationary toothed clutch on the lever, and a revoluble clutch in engagement with the rack, said parts being constructed and arranged whereby when the horn is in its inoperative position the two clutches are out of engagement.



26. In a nailing-machine, in combination, a reciprocatory horn, a vibrating lever, a rack connected with the horn, a toothed clutch-roll mounted on said lever, a stationary clutch confronting the revoluble clutch, stops on said clutches, and a spring for thrusting the clutches into engagement, said parts being constructed and arranged whereby the horn is not reciprocated when there is no shoe upon it.

27. In a nailing-machine, in combination, a reciprocatory horn, a vibrating lever, a rack connected with the horn, a treadle for depressing the horn, a stationary toothed clutch on the lever, a rotary clutch mounted on the said lever and meshing with the rack, coacting stops carried by said clutches, and a cam for acting on the rotary clutch to throw it out of engagement with the stationary clutch.

28. In a nailing-machine, in combination, a reciprocatory horn, a vibrating lever, a rack connected with the horn, a toothed clutch-roll journaled on said lever, a stationary toothed clutch on said lever, a spring for thrusting said clutches into engagement, coacting stops carried by the said clutches, and a cam for thrusting said clutches out of engagement.

29. In a nailing-machine, in combination, a spindle, means for feeding the wire through said spindle, mechanism for controlling the said wire-feeding means, a horn, means for depressing said horn, and treadles or foot-levers arranged in proximity and one below the other, one treadle connected to the horn-depressing means, and the other connected to the wire-feed controlling means.

602,185. VENDING-MACHINE. Michael Benedict, Newark, N. J. Filed June 14, 1897. Serial No. 640,629. (No model.)

Claim.—1. In a vending-machine, a candy or goods holding reservoir, a tubular shaft, an arm or arms on said shaft, and a bucket or buckets on said arm or arms, a delivery-chute connected with said reservoir, and a coin-controlled mechanism for intermittently operating said shaft and bringing one of said buckets past the mouth of the chute, consisting, essentially, of a disk or plate on said shaft and means connected with said shaft for causing a step-by-step movement of said disk or plate and said shaft, substantially as and for the purposes set forth.

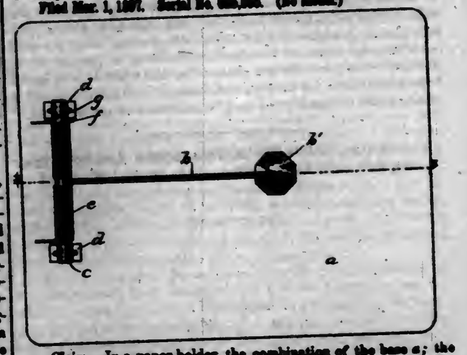
2. In a vending-machine, a candy or goods holding reservoir, a tubular shaft, an arm or arms on said shaft, and a bucket or buckets on said arm or arms, a chute connected with said reservoir, and mechanism for operating said shaft and bringing one of said buckets past the mouth of the chute, consisting, essentially, of a disk or plate f on said shaft, arms f' on said plate, a spindle h' in said shaft, a weighted arm h on said spindle, and a spring-actuated pawl or dog on said arm h adapted to engage with an arm on said plate f and operate the same, substantially as and for the purpose set forth.

3. In a vending-machine, a casing C, having a glass front, a pair of chambers divided by a partition having an opening, for establishing communication between said chambers, a tubular shaft extending through both chambers, an arm or arms on said shaft, and a bucket or buckets on said arm or arms, exposed to view through said glass front, a delivery-chute connected with said reservoir, and a coin-controlled mechanism for operating said shaft, and bringing one of said buckets past the mouth of the chute, consisting, essentially, of a disk or plate on said shaft and means connected with said shaft for causing a step-by-step movement of said disk or plate and said shaft, substantially as and for the purposes set forth.

4. In a vending-machine, a candy or goods holding reservoir, comprising a pair of chambers divided by a partition having an opening, for establishing communication between said chambers, a tubular shaft extending through said chambers, an arm or arms on said shaft, and a bucket or buckets on said arm or arms, a chute connected with said reservoir, and mechanism for operating said shaft and bringing one of the buckets past the mouth of the chute, consisting, essentially, of a disk or plate f on said shaft, arms f' on said plate, a spindle h' in said shaft, a weighted arm h on said spindle, and a spring-actuated dog or pawl on said arm h adapted to engage with an arm on said plate f and operate the same, substantially as and for the purpose set forth.

5. In a vending-machine, a candy or goods holding reservoir, comprising a pair of chambers divided by a partition having an opening, for establishing communication between said chambers, a tubular shaft extending through said chambers, an arm or arms on said shaft, and a bucket or buckets on said arm or arms, a chute connected with said reservoir, and mechanism for operating said shaft and bringing one of the buckets past the mouth of the chute, consisting, essentially, of a disk or plate on said shaft and means connected with said shaft for causing a step-by-step movement of said disk or plate and said shaft, and mechanism adapted to be actuated by the action of a coin and cooperating with said means for causing the movement of said disk or plate, substantially as and for the purposes set forth.

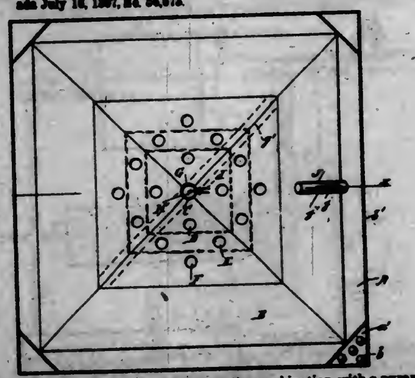
6. In a vending-machine, a candy or goods holding reservoir, comprising a pair of chambers divided by a partition having an opening, for establishing communication between said chambers, a tubular shaft extending through said chambers, an arm or arms on said shaft, and a bucket or buckets on said arm or arms, a chute connected with said reservoir, mechanism for operating said shaft and bringing one of the buckets past the mouth of the chute, consisting, essentially, of a disk or plate on said shaft and means connected with said shaft for causing a step-by-step movement of said disk or plate and said shaft, and mechanism, comprising a pair of spindles l and o having coin-receiving slots, a shaft n and a flexible connection cooperating with said means for the movement of said disk or plate, substantially as and for the purposes set forth.



7. In a vending-machine, a candy or goods holding reservoir, a tubular shaft, an arm or arms on said shaft, and a bucket or buckets on said arm or arms, a chute connected with said reservoir, and mechanism for operating said shaft and bringing one of said buckets past the mouth of the chute, consisting, essentially, of a disk or plate f on said shaft, arms f' on said plate, a spindle h' on said shaft, a weighted arm h on said spindle, a spring-actuated pawl or dog on said arm h adapted to engage with an arm on said plate f and operate the same, and mechanism adapted to be actuated by the action of a coin and cooperating with said arm h to cause the movement of the latter, substantially as and for the purposes set forth.

8. In a vending-machine, a candy or goods holding reservoir, a tubular shaft, an arm or arms on said shaft, and a bucket or buckets on said arm or arms, a chute connected with said reservoir, and mechanism for operating said shaft and bringing one of said buckets past the mouth of the chute, consisting, essentially, of a disk or plate f on said shaft, arms f' on said plate, a spindle h' on said shaft, a weighted arm h on said spindle, a spring-actuated pawl or dog on said arm h adapted to engage with an arm on said plate f and operate the same, a grooved portion h^2 on said arm h, and mechanism, comprising, a pair of spindles l and o having coin-receiving slots, a shaft n, a wheel n^2 on said shaft, and a flexible connection between said wheel n^2 and said grooved portion h^2, substantially as and for the purpose set forth.

9. In a vending-machine, a coin-chute l, and a spring-actuated plate u having prongs extending into and through perforations in said chute, all in combination, with a shaft n, a wheel on said shaft, a pair of spring-like clamping-arms n^4 on said wheel, and a flexible connection between said arms n^4 and said plate u, substantially as and for the purposes set forth.



10. In a vending-machine, the combination, with the bracket m having a bearing, and the operating mechanism carried thereby, of a shaft p, and a spring-plate r and bearing-post r' for the one end of said shaft p, substantially as and for the purposes set forth.

602,186. PAPER-HOLDER. Gideon H. Kent, Cambridge, Mass. Filed Mar. 1, 1897. Serial No. 626,295. (No model.)

Claim.—In a paper-holder, the combination of the base a; the curved arm b, attached at one end to the rod c, the ends of which rest in sockets d, d'; the spring e, the center of which is curved upward to form a loop which bears against the arm b, so as to cause the free end of said arm to rest upon the base; and the catch f, fitting into the indentation g in the socket d'; substantially as, and for the purpose, above described.

602,187. GAME APPARATUS. Thomas Renwick, Miami, Canada. Filed July 12, 1897. Serial No. 644,170. (No model.) Patented in Canada July 16, 1897, No. 56,673.

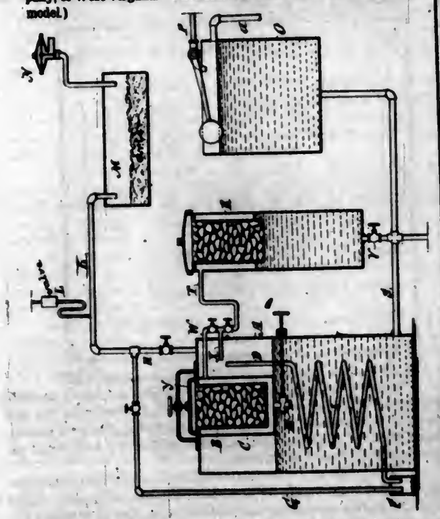
Claim.—1 In a game apparatus, the combination, with a pyramid provided with a hole at its apex, of an ejector-tube let into the said hole and provided with a spring-actuated piston, and a catch projecting within the said tube and normally holding the said piston depressed, substantially as set forth.

2. In a game apparatus, the combination, with a base-board provided with compartments on its surface, of a hollow pyramid placed over the said compartments and provided with holes in its sides communicating with the said compartments, and a hole in its apex; and an ejector-tube provided with a spring-actuated piston and let into the said hole at the apex of the pyramid, substantially as set forth.

3. An ejector-tube provided with a spring-actuated piston, a pivoted catch projecting through a slot in the side of the tube and operating to retain the piston in its depressed position, said catch being adapted to release said piston upon the introduction of a ball or marble in said tube, guides for the catch on the side of the tube, and an elastic band encircling the said tube and catch, substantially as set forth.

4. In a game apparatus, the combination with a base-board having compartments; and a hollow pyramid placed over said compartments, said pyramid being provided with openings arranged in series; of means for automatically ejecting the ball or marble when the same has passed into the central opening, substantially as described.

5. In a game apparatus, the combination with a pyramid provided with an opening at its apex; of an ejector-tube connected with said opening, said tube being provided with a spring-actuated piston; and a catch projecting within said tube, said catch being adapted to normally hold said piston in its inoperative position, said catch being adapted to be released automatically by the action of the ball or marble passing into said tube, substantially as described.

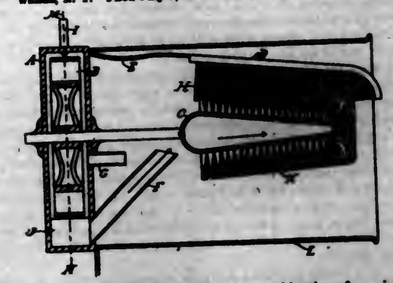


6. In a game apparatus, the combination with a base-board provided with a series of compartments; of a removable hollow pyramid placed over said compartments, said pyramid being provided with openings arranged in series, corresponding in position to the position of said compartments; balls or marbles adapted to be passed over said pyramid and through said openings; and means, secured to said pyramid for passing said balls or marbles over said pyramid.

602,188. TRUNK FOR UNDERGARMENTS. Lena Sittig, Brooklyn, N. Y. Filed Mar. 16, 1897. Serial No. 627,826. (No model.)

Claim.—A trunk for garments, comprising a main portion slitted centrally from back to front and provided with a laterally-elongated opening at the crotch, a toilet-flap and front closure connected along an arched line at the crotch and having their opposite edges attached to the main part of the trunk at distances spaced from the central line or slit of the main portion, substantially as set forth.

602,189. APPARATUS FOR GENERATING ACETYLENE GAS. Joseph A. Vincent, Philadelphia, Pa., assignor to the Electro Gas Company, of West Virginia. Filed Mar. 30, 1896. Serial No. 585,243. (No model.)



Claim.—1. The combination with the water-tank A having gas-outlet pipe of a carbid-receptacle B located in a vessel C in the upper part of the vessel A, the vessel C, which vessel C has a communication provided with a valve E with the lower part of the tank A, a second generator R having a carbid-receptacle in its upper part which communicates with the lower part of said receptacle R, the said carbid-receptacles B and R being at substantially the same height, the automatic water-supply O communicating with both generators and located at a height above the bottom of the said generators, and connections between the generators provided with valves, substantially as described.

2. The combination in a gas-generator of the water-tank A, having the internal receptacle C, permanently placed in its upper portion and above the water-level when the water is depressed, and having cock E and removable cover Y, substantially as described.

3. The combination in a gas-generator of the water-tank A, having the internal receptacle C, permanently placed in its upper portion and above the water-level when the water is depressed, and having cock E and the water-supply P, substantially as described.

4. The combination in a gas-generator of the water-tank A, having carbid-receptacle B and inclosing chamber C, permanently placed in its upper portion and above the water-level when the water is depressed, and having the valve E and the condenser placed in the chamber A, substantially as described.

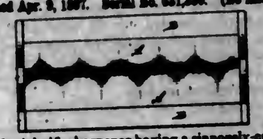
602,190. TUMBLER-WASHER. Joseph J. Evans, North Tonawanda, N. Y. Filed July 2, 1897. Serial No. 643,316. (No model.)

Claim.—1. In a tumbler-washer, the combination of a casing provided with a water-inlet, a stationary brush attached to said casing, a hollow rotary brush mounted on a shaft journaled in the casing, a water-wheel on said shaft within the casing, a discharge-pipe leading from the casing to the interior of said hollow brush, and a deflecting-plate within the casing adjacent to said wheel, for deflecting discharge-water into the discharge-pipe, all substantially as described.

2. In a tumbler-washer, the combination of a casing provided with a water-inlet, a stationary brush attached to said casing, a hollow rotary brush mounted on a shaft journaled in the casing, a water-wheel on said shaft within the casing and a discharge-pipe leading from the casing to the interior of said hollow brush, substantially as described.

3. In a tumbler-washer, the combination of a casing containing a rotary water-motor, a hollow rotary brush operated by said motor, a spring-supported stationary brush attached to the casing adjacent the rotary brush and a projection on the stationary brush adapted to be engaged by the article being cleansed and thereby force the brush against its exterior surface, substantially as described.

602,191. DILATOR FOR FINGERS OF THE HAND. Richard A. Loughrey, San Francisco, Cal. Filed Aug. 17, 1896. Serial No. 603,079. (No model.)



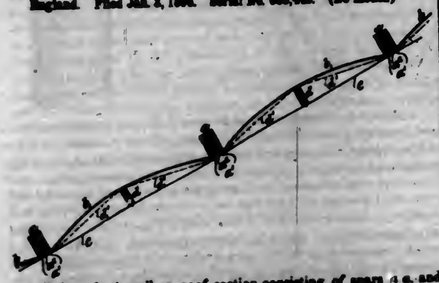
Claim.—1. A dilator consisting of parallel plates having suitable holes and slots, objects or bodies upon which the fingers are stretched and which are located between said plates and having pins passed through the holes and slots therein, and an object or body upon which the thumb is stretched detachably connected with said plates, substantially as described.

2. A dilator consisting of one or more plates formed of interconnected sections, objects or bodies upon which the fingers are stretched and which are held thereby, and means for shifting the plate-sections, substantially as described.

3. A dilator consisting of distenders adapted to be slipped between the fingers, and of plates having holes and slots in which the ends of the rollers are placed, substantially as described.

602,192. KNIFE-SHARPENER. John W. Mailloux, New York, N. Y. Filed Apr. 9, 1897. Serial No. 631,299. (No model.)

Claim.—1. A knife-sharpener having a sinuously-curving groove therein with sides converging to the bottom, the side walls thereof curving upward and outward forming corresponding wavy or corrugated surfaces, said surfaces being composed of abrading material, substantially as described.



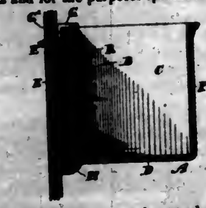
2. A knife-sharpener, comprising a frame having end openings accommodating the knife-blade and two opposed sharpening members held in said frame having abrading-surfaces which flare upwardly and outwardly on curved lines, said surfaces being corrugated so that the groove between the sharpening members forms a sinuous line and the space between the two sharpening members being in line with the end openings in the frame, substantially as described.

602,193. BRUSH. Charles A. Heubel, Boston, Mass. Filed May 21, 1897. Serial No. 637,503. (No model.)

Claim.—A bicycle-tire brush consisting of a pair of concave expansive brushes, a spring attached to the brush-holders and a yielding scraper or wiper attached to the adjacent ends of the brush-holders substantially as and for the purpose set forth.

602,194. PORTABLE HOUSE. Edward L. Frame, Darlington, England. Filed Jan. 2, 1896. Serial No. 665,449. (No model.)

Claim.—1. A wall or roof section consisting of spars *a a*, and arched boards *b b* secured by their edges to the spars *a a*, wire connections between the spars and filling the intervals between the spars.



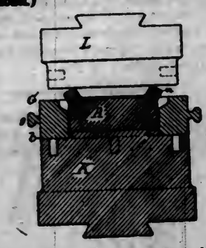
2. A wall or roof section consisting of spars *a a*, arched boards *b b*, in the intervals between the spars, wires *c*, tying the spars one to the other and planks *d*, supporting the arched boards from the wires in the intervals between the spars.

3. A wall or roof section consisting of spars *a a*, arched boards *b b*, the edges of which enter recesses in the spars, fillets *a'* covering and securing the edges of the boards, wires *c c* passed through staples *a² a²* and fixed by them to the spars and planks *d d* inserted between the wires and the arched boards.

4. A flooring-section consisting of a flat board *e*, a corrugated board *f* fixed thereon, and a layer of cement *g*, spread over the corrugated board and filling the corrugations on the upper surface thereof.

602,195. WATER-CLOSET TANK. Charles Pfau, Cincinnati, Ohio, assignor to the Pfau Manufacturing Company, same place. Filed July 9, 1897. Serial No. 643,994. (No model.)

Claim.—1. The combination of a water-closet tank having a recessed back with rearwardly-projecting side edges, and rearwardly-projecting bottom edge, and having the upper back hooks, and the supplemental plate, recessed at rear to receive the limbs of said hooks, and having the lower forwardly-projecting flange adapted to extend under the tank, and the rear edge of the tank-bottom cut away to receive that part of the back which supports the said bottom flange, substantially as and for the purposes specified.



2. The combination of a water-closet tank having a recessed back with rearwardly-projecting side edges and a rearwardly-projecting bottom edge, and having the upper back hooks, and the supplemental plate, recessed at rear to receive the limbs of said hooks, and having the lower forwardly-projecting flange adapted to extend under the tank, and the bottom edge of the tank cut away to receive that part of the supplemental back which receives the said flange, that part of the back being contracted in width and less than the length of the flange, the remaining rear edges of the bottom of the tank and their joint with the supplemental back being covered by the extended flange of the back, substantially as and for the purposes specified.

3. The combination of the supplemental back contracted near the bottom and terminating in a flange extending forward and beyond the adjacent edges of the back, and the water-tank having sides extending rearwardly beyond the back, and parts of the bottom also extended rearwardly and over the flange and assisting to conceal joints, substantially as and for the purposes specified.

4. In a water-tank elevated above the floor, the combination of the supplemental back, having bottom forward projection, and the tank having the upper hook-formed device for engaging the upper edge portion of the supplemental back, the tank being free to swing and rest against the lower part of the supplemental back, and being supported by the extended bottom flange of the latter, substantially as and for the purposes specified.

5. In a water-tank elevated above the floor, the combination of the supplemental back having bottom forward projection, and contracted just before it reaches the projection, and leaving the projection extending laterally beyond the neck, and the tank having the upper hook formed device for engaging the upper edge portion of the supplemental back, the latter recessed where the engagement with the hook-formed device takes place, the tank being free to swing and rest at its lower portion against the lower part of the supplemental back and being supported by the extended bottom flange of the latter, substantially as and for the purposes specified.

602,196. DIE FOR FORGING SOLID-METAL CAR-WHEELS. Samuel H. Raimer, Norristown, Pa. Filed Dec. 22, 1896. Serial No. 616,686. (No model.)

Claim.—1. In combination the upper die L, having a plain flat surface, the lower die K having a raised center *a*, with a plain flat surface, which forms a centering-plug and the shoulder *b* formed around the centering-plug, by depressing the outer edge of the die below the level of the centering-plug, and a wall-ring G, which rests on the shoulder *b* and around the raised center to form the wall of the anvil-die, substantially as described.

2. In combination, the upper die L, having a plain flat surface, the hammer-block, unattached to the upper die and resting upon the center of the blank, the lower die K having a raised center *a*, with a plain flat surface to form a centering-plug and the shoulder *b*, formed around the centering-plug by depressing the outer edge of the die below the level of the centering-plug and a wall-ring G, which rests

on the shoulder *b* and around the raised center to form the wall of the anvil-die substantially as described.

3. In combination the plain-surfaced upper die L, the lower die K having a raised centering plug *a*, with a plain flat surface, thereon, the depressed shoulder *b* surrounding the centering-plug and a wall-ring G, and its flange-groove therein fitting closely around the centering-plug and resting upon the shoulder substantially as described.

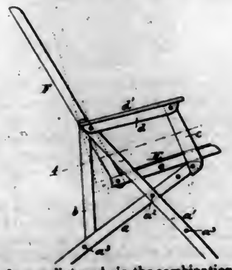
4. In combination the die W having the fixed ring *c*, around its center, the die V, having the fixed collar *d* around its center, the raised portion *a'* constituting a centering-plug and the circular shoulder *b'* formed by depressing the die near its periphery, substantially as described.

5. In combination the die W, having the fixed ring *c*, around its center, the die V having the fixed collar *d*, around its center, the raised portion of *a'* with plain flat surface, constituting a centering-plug and the circular shoulder *b'* formed around the centering plug, by depressing the face of the die near its periphery, the wall-ring U, having a flange-groove therein and constructed and arranged to fit around the centering plug, substantially as described.

6. In an apparatus for forging and extending the web of a wheel-blank radially from the hub toward the tread, the combination of the die W having the fixed ring *c* near its center, and the die V, with the fixed ring *d*, near its center and having a raised center around the ring *d*, forming a centering-plug *a'* with a plain flat surface, substantially as described.

7. An apparatus for forging, forming and finishing a solid-metal car-wheel consisting in the combination with the die W having the fixed ring *c* around its center, the die V having the fixed collar *d* around its center, the raised portion *a'* constituting a centering-plug and the circular shoulder *b'* formed around the centering-plug by depressing the face of the die near its periphery the loose plating-rings *e* and *f* and the wall-ring U, having a flange-groove therein fitted around the centering-plug *a'* substantially as specified.

8. In apparatus for forging, forming and finishing a solid-metal car-wheel and causing the metal of the blank to flow radially outward from the hub to the tread and flange the combination with the die W its fixed collar *c* and the loose plating-ring *e*, of the die V with its fixed collar *d*, the loose plating-ring *f* and the wall-ring U having a flange-groove therein substantially as described

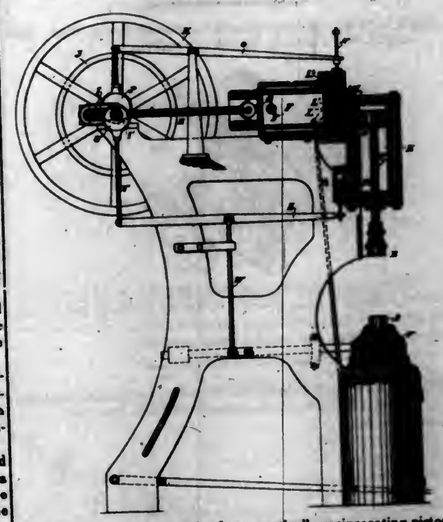


9. In apparatus for forging and shaping the web of a solid-metal car-wheel the combination of the dies W, V, with the fixed collars *c* and *d*, the wall-ring U with its flange-groove therein and the loose plating-rings S, T, substantially as described.

10. An apparatus for forging solid-metal car-wheels, the combination of the dies L, K and their wall-ring G, for forging and flanging a wheel-blank, with the dies W, V, and their wall-ring U, with the fixed and loose collars for forging, forming and finishing a solid-metal car-wheel.

11. The combination of the dies L, K, the plate or punch H, and the wall-ring G, having a flange-groove for forming a flange on a solid-metal wheel-blank by blows or pressure at right angles to the sides of the blank, with the dies W, V, their fixed collars *c* and *d*, the loose collars *e* and *f*, and the wall-ring U having a flange-groove thereon, for forging, forming and finishing the flanged blank into a finished car wheel.

12. In an apparatus for producing car-wheels the combination of means for forging a flange on a wheel-blank by blows or pressure at right angles to the side of the wheel-blank, with means for shaping and finishing by forging, so constructed and arranged as to cause the metal to flow radially outward from the hub to the tread and flange under an operative force.



602,197. RECLINING-CHAIR. HIRAM F. RANKIN, Ottawa, Canada, assignor of one-half to Thomas W. A. Lindsay, same place. Filed Nov. 20, 1897. Serial No. 659,221. (No model.)

Claim.—1. In a reclining-chair, the combination with the crossed legs forming the sides of the chair, of upright stop-bars connecting the rear portions of each pair of legs, a back pivoted near its lower end to the upper portions of said stop-bars, and a sliding seat having its rear edge pivotally connected with the lower end of the back and having its front portion loosely supported upon the upper portions of the rearwardly-inclined legs, the rear portion of the seat being arranged to abut against said stop-bars in the normal rearward position, of the seat, substantially as set forth.

2. In a reclining-chair, the combination with the crossed legs forming the sides of the chair, front struts or standards extending upwardly from the upper ends of the rearwardly-inclined legs, arm-rests connecting the upper ends of said standards with the upper ends of the forwardly-inclined legs, upright stop-bars connecting the upper and lower rear members of the crossed legs, a back pivoted near its lower end to the upper end of said stop-bars, and a seat pivoted at its rear edge to the lower end of the back and resting upon the upper front portions of the cross-legs, and arranged to abut against said stop-bars in the rearmost position of the seat, substantially as set forth.

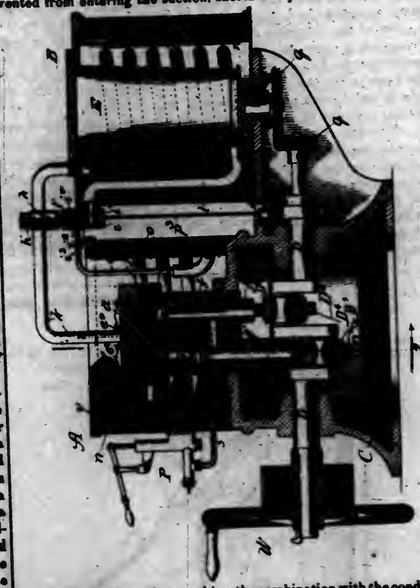
602,198. COMPRESSED-AIR HAMMER. JACOB SCHMIDT, Rio Vista, Cal. Filed June 22, 1897. Serial No. 641,775. (No model.)

Claim.—1. A hammer fixed to a vertically-reciprocating piston-rod having a piston fixed to its opposite end and movable within a containing-cylinder, a second cylinder disposed at right angles to the first-named cylinder, a plunger movable in the second cylinder and connected with a mechanism whereby air is compressed in said second cylinder, a passage between the two cylinders, a valve whereby said passage is closed until the air in the compressing-cylinder has reached any desired tension, and a mechanism connecting said valve with a crank or eccentric upon the main driving-shaft whereby the valve is opened, and the air in the first cylinder is admitted to propel the piston of the second, and a valve and connections for regulating or varying the force of the hammer's blow.

2. In a compressed-air hammer, cylinders disposed with relation to each other, one of said cylinders having a piston movable therein with a piston-rod and a hammer-head connected with the outer end of the piston-rod and adapted to be propelled thereby, a plunger in the other cylinder, a crank-shaft, a connecting-pitman by which the plunger is movable whereby air is compressed in said cylinder by each inward reciprocation of the plunger, a passage connecting said cylinder with the first-named cylinder above its piston whereby the compressed air is admitted in successive charges to impel said piston downward, and a valve actuated by the rotation of the crank-shaft whereby the passage controlled by the valve is retained in closed condition until the air is compressed to the desired tension, and afterward opened to admit it under full pressure of the second cylinder, and a valve and connections for regulating or varying the force of the hammer's blow.

3. In a compressed-air hammer, a cylinder having a piston movable therein, a piston-rod, the lower end of which carries a hammer, a second cylinder arranged with relation to and connecting through an open passage with the upper end of the first-named cylinder, a plunger and mechanism by which it is reciprocated in said second cylinder and to compress air therein, a valve movable so as to retain the connecting-passage closed until the air in the second cylinder has been compressed to the desired tension, connection between said valve and the crank-shaft through which the compressing-piston is actuated, whereby the valve is reciprocated to alternately close and open the passage, a discharge-passage from the lower end of the hammer-cylinder, a valve adjustable to intercept said passage to any desired degree whereby a back pressure is created in the lower part of the cylinder and the force of the blow delivered by the piston and connected parts is regulated.

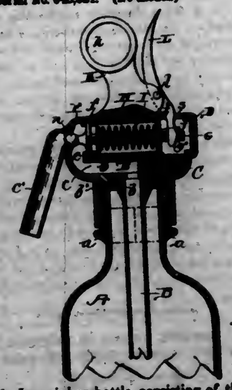
4. In a compressed-air hammer, a vertical cylinder having a piston reciprocating therein, a piston-rod extending through the lower head of the cylinder and carrying a hammer at its lower end, a compressing-cylinder with a passage connecting it with the upper end of the hammer-cylinder, a crank-shaft and crank whereby the plunger of the compressing-cylinder is actuated, a valve adapted to intercept the passage between the two cylinders until the desired amount of compression is obtained in the compression-cylinder, and mechanism connecting with the crank-shaft to automatically open the valve and allow the air to pass into the hammer-cylinder, a passage opening out of the lower part of the hammer-cylinder, a valve whereby said passage may be intercepted or cut off to any desired degree, a fulcrumed lever, one end of which connects with the said valve and the other with an eccentric upon the crank-shaft by which the valve is actuated to partially intercept the escape of air from the lower part of the hammer-cylinder and to correspondingly reduce the force of the blow.



5. In a compressed-air hammer, a vertical cylinder having a piston reciprocating therein, means for admitting air under pressure above said piston, a passage from the lower part of the cylinder through which the air escapes as the piston moves downwardly, a valve movable to intercept said passage to any desired degree and thus cushion the piston at the lower end of its stroke, a lever-arm one end of which is connected with the valve-stem, the other with an eccentric upon the shaft through which the air is compressed, a fulcrumed bar to which the intermediate part of said lever is fulcrumed, a second lever to which the lower end of said fulcrumed bar is connected, said lever being movable up or down so that the valve may be reciprocated by the eccentric without interdopting the air-discharge passage when a full blow is required or it may be moved downwardly to partially intercept the passage for a lighter blow.

6. In a compressed-air hammer, a main cylinder with a piston movable therein, a piston-rod extending through the lower head carrying the hammer with its lower end, a second cylinder having a passage connecting it with the first-named cylinder above its piston and plunger movable in the second cylinder, a crank-shaft and a pitman connecting it with the plunger whereby the latter is reciprocated to compress air on each inward stroke of the plunger, a valve actuated in unison with the movements of the plunger whereby said valve is opened when the desired pressure has been attained within the compression-cylinder and the air under such pressure is admitted into the hammer-actuating cylinder, and a second passage crossing the first passage having a cock through which this first-named passage passes when the apparatus is in operation, and a foot-lever connection whereby said cock may be turned to close the direct connection between the cylinders and allow the air to escape from the compression-cylinder without acting in the lower cylinder.

602,199. REFRIGERATING-MACHINE. JULIUS SIEBLACKE, Nuremberg, Germany. Filed Feb. 26, 1897. Serial No. 626,128. (No model.) Patented in France Dec. 21, 1896, No. 258,856; in Germany Feb. 10, 1898, No. 82,733; in Italy Mar. 26, 1898, No. 1,194; in Austria-Hungary May 6, 1898, No. 1,089 and No. 8,627, and Aug. 20, 1898, No. 10,200; in Switzerland July 22, 1898, No. 7,268, and June 25, 1894, No. 8,786; in Belgium Aug. 25, 1894, No. 95,943, and in England May 14, 1895, No. 9,830.

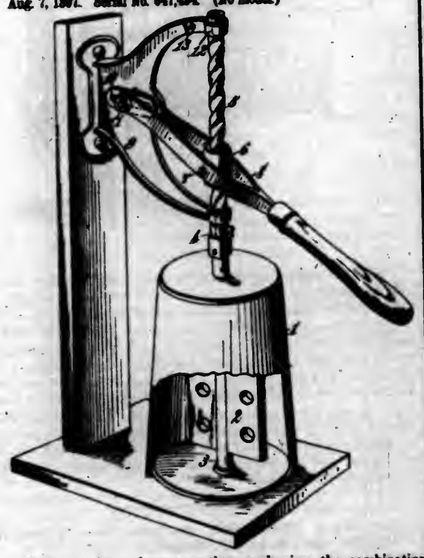


Claim.—1. In a refrigerating-machine, the combination with the condenser and refrigerator of a suction-chamber into which the refrigerator-coil discharges, a discharge-chamber connected with the condenser-coil, a pair of piston-chambers having valve-controlled connection with said suction-chamber and valve-controlled connection with said discharge-chamber, pistons in said piston-chambers and oil-chambers therein behind the pistons, and a by-pass communicating at one end with said oil-chambers and provided with a float-valve having a seat above and below it, whereby gas is prevented from passing from the suction into said oil-chambers and whereby oil is prevented from entering the suction, substantially as described.

2. In a refrigerating-machine, the combination with the condenser and refrigerator of a suction-chamber into which the refrigerator-coil discharges, a discharge chamber connected with the condenser-coil, a pair of piston-chambers intercommunicating through an oil-chamber at one end and each having a valve-controlled connection with said suction-chamber and a valve-controlled connection with said discharge-chamber, pistons in said piston-chambers, and a by-pass leading from said oil-chamber and provided with a float-valve having a seat above and below it, whereby gas is prevented from passing from the suction into said oil-chamber and whereby oil is prevented from entering the suction, substantially as described.

3. In a refrigerating-machine, the combination with the condenser and refrigerator of a compressor seated in the condenser-tank and surrounded therein by the condenser-coil, said compressor containing the piston-chambers *g* and *f* and communicating through an oil-chamber *d'*, the head G of said compressor containing the suction-chamber H into which the suction-pipe *k* leads, the discharge-chamber I communicating with said condenser-coil, the suction-valves *d* and *d'* and discharge-valves *c* and *c'*, pistons *g'* and *f'* in said piston-chambers, and a by-pass *o* leading from said oil-chamber to said suction-chamber and provided with a float-valve *o'* having a seat above and below it, whereby gas is prevented from passing from the suction into said oil-chamber and whereby oil is prevented from entering the suction, substantially as described.

602,200. SIPHON-HEAD. EMIL SIEGEL, Peoria, Ill. Filed June 11, 1897. Serial No. 640,281. (No model.)



Claim.—1. In a siphon-bottle consisting of the top C, provided with an inwardly-extending integrally-formed tube E, having an open flange at its inner end, a cavity or channel surrounding the tube, of a yielding valve secured in the end of the tube E, provided with a ball or head fitting into a valve-opening in the cavity leading to the spout, and having an extended circular flange and means for tight-

ening the pressure of the valve in the opening consisting of the cap J, suitably carried in connection with tube E, as to be adjustable within said tube providing a positive means for holding the valve in position.

2. In combination with a siphon-bottle, the head or top C, having an inwardly-projecting integrally-formed tube E, having an open flange at its inner end, a cavity or channel surrounding the tube, and a valve of the character described, consisting of the ball or head fitting into a valve-opening leading to the spout and having an extended circular flange carried within the tube E, and bearing against the flange on the tube, of the supplemental tube H, carried within the tube E, and having a flange abutting with the flange of the valve holding the same in position between the flanges of the tubes E and H, preventing any leakage into the tubes, a cap fitting into the tube H, at the rear purposed for adjusting the pressure of the spring upon a washer on the valve-stem, making a positive pressure upon the valve and insuring its close contact with the valve-spring in the spout, and a lever L, pivoted to an arm extension from the top piece and carried through an opening in the casing and inserted in the slot in the valve-stem for drawing liquid from the bottle, all substantially as described and shown

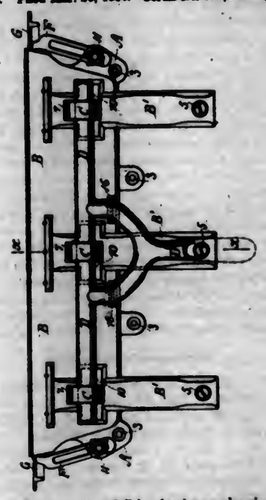
602,201. CHURN. WILLIAM G. STONE, Charlotte, N. C. Filed Aug. 7, 1897. Serial No. 647,494. (No model.)

Claim.—1. In a churn-operating mechanism, the combination with the churn-body, a vibratory dasher therein, a dasher-shaft therefor, a spirally-threaded shaft-section engaged with said dasher-shaft, a bracket supporting said shaft-section, and an interiorly-threaded bur or nut vertically movable on said shaft-section, of an operating-lever engaged intermediate its ends with said bur or nut and having its inner end horizontally movable in a slot in the supporting-bracket, substantially as set forth.

2. In a churn-operating mechanism, the combination with the churn-body, a vibratory dasher therein, a dasher-shaft therefor, a spirally-threaded shaft-section engaged with said dasher-shaft, a bracket supporting said shaft-section, and an interiorly-threaded bur or nut vertically movable on said shaft-section, of an operating-lever having its inner end bifurcated and slightly resilient, said bifurcated portion adapted to engage with trunnions on said bur or nut, and a bolt engaged with the extreme inner ends of the bifurcated lever and movable horizontally in a slot in the supporting-bracket, substantially as set forth.

602,202. GAS-COCK. ALBERT W. TUCKERMAN, Wakefield, Mass. Filed Sept. 21, 1897. Serial No. 652,422. (No model.)

Claim.—In combination with a gas-cock, a locking-pin run transversely through the plug of the cock, said pin having one end bent up to engage notches in the valve-casing, a resilient J-shaped strip having its long end connected to the straight end of said locking-pin and the other end secured to the face of the thumb-piece making the long arm parallel therewith whereby when the thumb-piece is grasped the long arm will also be grasped and pressed inwardly the locking-pin being thereby moved out of engagement with the notches, as and for the purpose set forth.



602,203. WITHDRAWN.

602,204. COMBINED CEMENT TUBE AND DISTRIBUTING-BRUSH. ANDREW L. WEIR, Toledo, Ohio. Filed Mar. 1, 1897. Serial No. 625,492. (No model.)

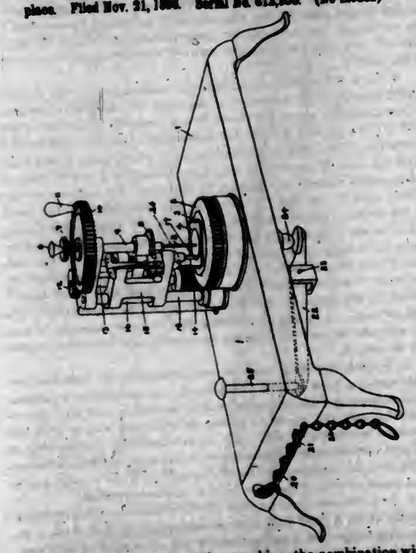
Claim.—A receptacle, for the purpose set forth, consisting of a flexible metallic tube closed at its lower end and provided with an externally-threaded aperture-pipe at its upper end, a nipple having an opening extending centrally therethrough, the lower portion of said opening being enlarged and threaded for the reception of said aperture-pipe, the upper end of said nipple being channeled out, forming parallel walls 10 and 11, the bristles having a portion of their ends seated in the channels of said nipple and held therein by clamping the wall 11 thereabout and the guard-cup 13 adapted to telescope over said nipple substantially as shown and described.

602,205. BAND-SAW CLAMP AND FILING-GUIDE. CHARLES B. WITSCHELL, New York, N. Y., assignor to Winchell & Hutchinson, same place. Filed Mar. 29, 1897. Serial No. 629,967. (No model.)

Claim.—1. The jaws A and B having integral spring legs extending down and means for connecting them together at the lower ends and stops projecting at the inner sides of the jaws and coming into contact when pressure is applied to the jaws, so as to relieve the spring-legs from strain, substantially as set forth.

2. The combination with the jaws A and B, of a clamp-bolt passing through the jaws, a nut upon the rear end of the clamp-bolt, the outer end of the clamp bolt being formed as a hook, a shaft perpendicular to the bolt and passing through the hook and parallel with the jaws, a lever and cams integral with the shaft, the cams being one at each side of the hook of the bolt and acting upon the surface of the front jaw, substantially as specified.

3. The combination with the jaws A and B, of a clamp bolt passing through the jaws, a nut upon the rear end of such clamp-bolt, the outer end of the clamp-bolt being formed as a hook, a cam-shaft passing through the hook of the clamp-bolt and having cams one at each side of such clamp-bolt and a handle forked and extending out from the cam-shaft near each of the cams, substantially as set forth.

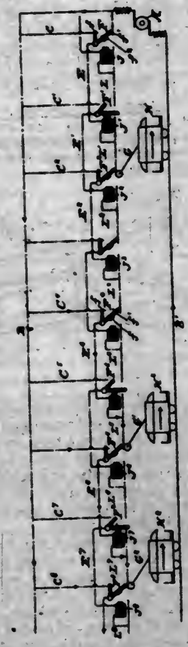


4. The stationary jaw A and movable front jaw B, in combination with the clamp-bolts passing through the jaws and having nuts upon their inner ends and formed as hooks upon their outer ends, a cam-shaft passing through the hooks of the clamp-bolts and having cams at each side of each bolt, there being projecting bearing-surfaces upon the front jaw for engaging the cams and a handle for turning the cam-shaft, substantially as set forth.

602,206. LANTERN. ALFRED L. BARON and JAMES F. HAFFEY, Tiffin, Ohio; said Haffey assignor to said Baron. Filed Mar. 8, 1897. Serial No. 626,499. (No model.)

Claim.—In a tubular lantern, the combination with its tubes, burner, spring-actuated globe, and globe-supporting mechanism, of a bell-crank lever pivoted at its ends to one of the tubes, its loop end overlapping the other, and bearing with its angular faces against the canopy, and a spring-wire latch secured at one end to that tube of the cylinder overlapped by the loop of the lever, and working in a slot therein in the path of the loop end of the lever, whereby, through the cooperation of the lever, the latch, and the globe-supporting mechanism, the globe may be depressed exclusively by manipulation of the lever, and may be elevated exclusively by manipulation of the latch, substantially as and for the purpose specified.

602,207. LENS-CUTTING MACHINE. FREDERICK G. BLANCHARD, Southbridge, Mass., assignor to the American Optical Company, same place. Filed Nov. 21, 1896. Serial No. 612,980. (No model.)



Claim.—1. In a lens cutting machine, the combination with the center tension-rod, the lens pattern secured on the arbor carrying the operating-gear, and the swinging frame carrying the diamond-holder, of an adjustable surface carried on said frame, and adapted to engage the lens pattern, and to be adjusted to vary the distance of the diamond-holder from the center of the lens to be cut, and a pointer connected with and moved by said adjustable surface, and a scale for the pointer, substantially as set forth.

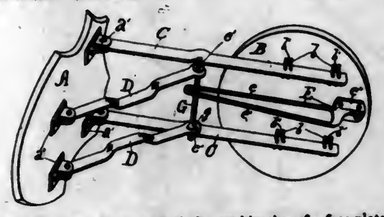
2. In a lens-cutting machine, the combination with the center tension-rod, the lens pattern secured on the arbor carrying the operating gear, and the swinging frame carrying the diamond-holder, of an adjustable surface carried on said frame, and adapted to engage the lens pattern, and to be adjusted to vary the distance of the diamond-holder from the center of the lens to be cut, and a pointer connected with and moved by said adjustable surface, and an adjustable scale for the pointer, substantially as set forth.

3. In a lens-cutting machine, the combination with the swinging frame carrying the diamond-holder, of an adjustable pin carried on said frame, the inner end of which is adapted to engage the edge of the lens pattern, and said lens pattern and a screw for moving the pin toward or away from the pattern, to cause the diamond-holder to move away from or approach the center of the lens to be cut, and a pointer connected with and moved by said pin, to indicate the graduations on a scale carried on the diamond-holder frame, and said scale, substantially as set forth.

602,208. ELECTRIC BLOCK SYSTEM. FRANK BURGER, Fort Wayne, Ind., assignor of three-fourths to Henry M. Williams, same place. Filed Aug. 2, 1897. Serial No. 646,794. (No model.)

Claim.—In an electrical railway block system, the combination with the leading and return conductors of a series of insulated trolley-sections, a series of section-feeders, a normally-closed switch for each section-feeder located at the entrance of each trolley-section and adapted to be engaged by the trolley, a connection between said switch and a rear trolley-section, and a switch-operating magnet in said connection whereby when a car enters a section the corresponding magnet is energized to open the switch and break the circuit controlling the rear section and when the trolley leaves the section and enters a succeeding section, the trolley operates the switch to restore it to its normal or closed position, substantially as described.

602,209. PAINTER'S ROOF-BRACKET. DARIUS CLELAND, Oakland, Cal. Filed June 21, 1897. Serial No. 641,708. (No model.)

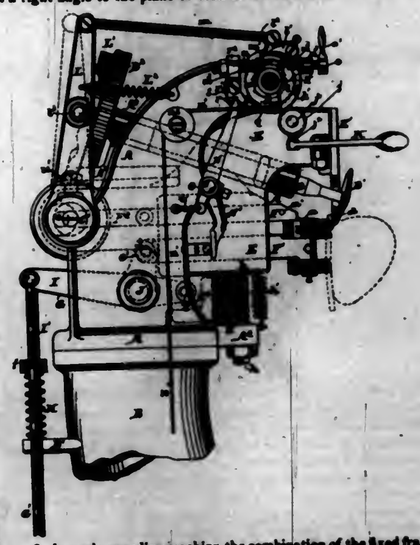


Claim.—1. A cleat for painters' hooks having a foundation or body, a series of spurs secured to said body, a metal member secured to said body and a metal rim projecting outward from said metal

member and adapted to engage the extremity of a painter's hook substantially as set forth.

2. The combination with body A, of one or more metal plates C C secured to said body and provided with integral spurs D, D', projecting plate G secured to said body and slightly offset therefrom, a plate secured to said body and formed with a depression, and a metal rim above said depression for the purpose of holding the painter's hook as set forth.

602,210. COUNTER-STOOL FOR STORES. GEORGE A. COULSON and JOHN MCCAW, Brockville, Canada. Filed Sept. 24, 1897. Serial No. 652,830. (No model.)



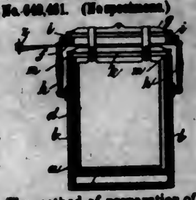
Claim.—1. In a counter-stool, the combination of a face-plate, a pair of bracket-arms, and a pair of braces hinged thereto, a seat secured to the outer end of said arms, a hook formed about midway and on the under side of each of said arms, a bar held in the outer ends of said braces having projecting ends adapted to engage said hooks, and a sprig-keeper attached to said seat and pressing against said bar; with tendency to force said bar against the under side of said arms when traveling midway thereof.

2. In an adjustable counter-stool, a seat, a vertically-swinging supporting-arm attached thereto, such arm being provided with means for detachably holding the traveling end of an adjustable brace, a vertically-swinging brace and means for forcing and holding said brace into engagement with a catch on said arm, and means for pivotally attaching one end of said arm and one end of said brace permanently to a fixed support, said supporting-arm and said brace being adapted to fold closely together in a vertical position against the face of said fixed support, when said seat is not extended for use.

602,211. SOLE-ROUNDING MACHINE. HANFORD T. CROSBY, Boston, Mass. Filed July 17, 1897. Serial No. 644,892. (No model.)

Claim.—1. In a sole-rounding machine the combination of a feed-disk revoluble in an inclined plane and arranged to engage the inseam of a boot or shoe to be acted upon; a horizontally-reciprocating cutter movable in a direction at right angles to the line of feed of the sole; a vertically arranged anvil-surface between said cutter and feed-disk, and in close proximity to the latter near the lowest portion of its periphery; a pressure-roll to bear against the tread-surface of the sole and force it into contact with said anvil-surface and the feed-disk; means for revolving said feed-disk; and means for imparting a rapid reciprocation to said cutter.

2. In a sole-rounding machine the combination of a feed-shaft mounted in fixed inclined bearings; a feed-disk carried by said shaft; means for imparting to said shaft and disk a constant rotation; an arm pivoted to the main frame at its rear end; means for moving said arm about its pivot, at the will of the operator; stops to limit the movements of said arm in both directions; a vertically-arranged anvil-surface carried by said arm with its operative end in close proximity to the rear face of said feed-disk; a pressure-roll carried by said arm and arranged to bear against the tread-surface of the shoe-sole to be acted upon; means for retracting said roll to permit the placing of the shoe in position: a horizontally-arranged slide fitted to a bearing in said arm; a cutter carried by the front end of said slide; and means for imparting to said slide a rapid reciprocation in a direction at a right angle to the plane of feed of the shoe-sole.



3. In a sole-rounding machine the combination of the fixed frame A'; the bracket A^5; the driving-shaft C provided with the crank-pin *c* and pulley C^5; the feed-shaft D; the feed-disk D'; the worm-wheel D^5; the worm C^5 carried by the shaft C; the arm E mounted upon a fulcrum-pin in axial line with the shaft C; the slides F and F' fitted to bearings in said arm E; the cutter *a* carried by the slide F; the rod F^5 connecting said slide to the crank-pin *c*; the pressure-roll *b* carried by the slide F'; the elbow-lever G connected to said slide F; the rod G and the spring H for reciprocating said slide; the anvil-plate E'; and stops to limit the upward and downward movements of the head E.

4. In a sole-rounding machine the combination of the driving-shaft C provided with the crank *c*; the worm C^5; the shaft D mounted in fixed bearings; the worm-wheel D^5 and feed-disk D' carried by said shaft D; the pivoted arm E; the screw-stop *h* to limit the downward movement of the front end of said head; the anvil-plate E', the truck *j* and the lever K carried by said arm; the slides F and F' fitted to and movable endwise in bearings in said arm; the cutter *a* carried by said slide F; the rod F^5 connecting the said slide F to the crank *c*; the pressure rolls *b b* carried by the slide F'; a spring for moving said slide and rolls toward the front; means for retracting said rolls; means for raising the front end of the arm E; the shaft L^2; the cams *k* and *k'* and the ratchet-wheel *l* all firmly secured upon the shaft L^2; the levers l^3 and m^3 loosely mounted upon said shaft; the pawl *l'* carried by the lever l^3; the shield *m'* carried by the lever m^3; the stops m^2 and *o*; a spring for holding the lever m^3 normally in contact with the stop m^2; and means for moving said lever into contact with the stop *o*.

5. In a sole-rounding machine the combination of a feed-disk revoluble about a fixed axis; a pivoted arm; an anvil-plate, a reciprocating cutter and a spring-pressed roll all carried by said arm; means for moving said arm about its pivot; an adjustable stop to limit the downward movement of said arm; an automatically-varying stop to limit and vary the upward movement of said arm; and means for imparting a rapid reciprocation to said cutter in a plane at right angles to the plane of feed of the shoe for the purpose specified.

6. In a sole-rounding machine the combination with a feed-disk revoluble about a fixed axis, of a pivoted arm; an anvil-plate, a reciprocating cutter and a spring-pressed roll all carried by said arm; means for moving said arm about its pivot; an adjustable stop for limiting the downward movement of said arm; a pair of cams mounted upon a common shaft; means for intermittently moving said shaft and cams about their axes in one direction to a limited extent; means for automatically returning said cams to their normal position; and a revoluble trunk carried by said pivoted arm and arranged to engage the periphery of one or the other of said cams to limit the upward movement of said arm; and means for moving said trunk lengthwise of its axis to transfer it from beneath one cam to a position beneath the other cam as set forth.

602,212. PROCESS OF AND APPARATUS FOR ELECTRODEPOSITING. EMILE L. DUBOSCQ, Epinay sur Seine, France. Filed Aug. 26, 1897. Serial No. 649,451. (No specimens.)

Claim.—1. The method of preparation of the cathodes consisting of depositing on them a thin layer of a metal capable of occluding hydrogen which is not attackable by the solution in which the cathode will be subsequently employed; subsequently saturating with hydrogen the surface of the thin layer of the metal, with which one has previously coated the cathodes in order to prevent the adherence of the metallic deposit to be afterward made, and lastly polishing the surface of the cathodes in order to obtain deposits equally polished.

2. The process which consists in first saturating the surface of a cathode which is of metal capable of occluding hydrogen with hydrogen, electrocoating the cathode with metal, and then stripping the deposit from the cathode.

3. The combination of a vat, anodes, one or more cathodes suspended on cross-bar *g*, conductors *i* on which bars *g* rest, a vibratory frame supporting conductors *i* and means for vibrating said frame.

4. The process consisting in coating a cathode of metal fusible at a low temperature with copper, coating the copper with a metal capable of occluding hydrogen and not attackable by subsequent baths to be used, hydrogenating and polishing the surface of the cathode, electrodepositing metal thereon, removing the fusible core by melting, and stripping the layers of metal first deposited on the cathode from the layer on said first layers.

602,213. GRINDING AND POLISHING DEVICE. GEORGE H. DYER, San Francisco, Cal. Filed June 22, 1897. Serial No. 641,705. (No model.)

Claim.—1. In a polishing or grinding apparatus, a suspending-rod and a main frame having one end carried thereby, disks or grinders journaled and supported in the opposite end adapted to rest upon the surface to be ground or polished, a flexible driving-belt and direction-pulleys over which it passes, through which power is transmitted to actuate the grinding-disks, and means comprising a yoke carried by the rod and serving to connect the latter with the frame and collars adjustable on the rod for varying the length of the latter to regulate the tension of the belt.

2. In a grinding and polishing apparatus, a main frame and suspending rod and yoke, knife-edge bearings by which the yoke is supported, an arc or segment connected therewith, a bolt and locking-nut connecting with the suspending-rod, whereby the yoke and frame may be tilted from one side to the other and fixed at any desired angle, and grinding-disks supported in the opposite end of the adjustable frame adapted to rest upon the surface to be ground or polished, and movable thereon.

3. In an apparatus for grinding and polishing, a main frame, a suspending-rod by which one end is supported, a yoke and adjusting and locking are whereby the frame may be turned from one side to the other, grinding-disks journaled and supported in the opposite end of the main frame with the peripheries of the disks adapted to be adjusted and rest upon the surface to be ground or polished, supports for this end of the main frame and screws whereby adjustment may be made to increase or decrease the amount of cut which the disks will make upon the surface to be operated on.

4. In a grinding and polishing apparatus, a main frame having one end adjustably suspended and capable of being tilted from side to side with an adjusting and holding mechanism, disks journaled at the opposite end of said frame, adapted to rest upon and be movable over the surface to be polished, a flexible driving-belt and direction-pulleys through which power is transmitted to rotate the disks, shanks or standards having ball-bearings adapted to rest and move upon a supporting-surface or guide, and screws whereby the disk-carrying frame may be raised or depressed to increase or decrease the amount of cut made by the disks upon the surface operated on.

5. In a device for grinding and polishing, a main frame having one end suspended with a tilting and locking mechanism whereby it may be turned from side to side about its suspending rod or hanger, grinding or polishing disks journaled at the opposite end of the frame so that they may be moved over a surface upon which they are to act, and a flexible driving-belt and direction-pulleys through which the disks are rotated, a supplemental adjusting frame or plate turnable about the vertical center whereby the grinding-disks may be caused to rotate in planes at an angle with the line of the main supporting-frame.

6. In a grinding or polishing apparatus, a main frame suspended and adjustable with relation to its point of suspension at one end, grinding or polishing disks journaled at the opposite end and independently adjustable therein, a flexible driving-belt and direction-pulleys through which power is transmitted to rotate the disks, so that by means of the independent adjustments at opposite ends of the main frame, any form of surface may be acted upon by the disks.

7. In a grinding or polishing apparatus, a main frame having one end adjustably and movably suspended, grinding or polishing disks journaled in the opposite end and independently adjustable, a suspending yoke or hanger and guides or tracks upon which the upper end of the hanger is supported and movable, a slidable bar adapted to travel between the fixed guides and prevent it from transverse motion therein, a crank mechanism connected with the hanger-frame and this guide whereby the frame and the grinding-disks are moved alternately from side to side.

8. In a grinding and polishing apparatus, a main frame adjustably suspended at one end and movable about its point of suspension, grinding or polishing disks journaled in the opposite end and independently adjustable, a yoke or frame extending upwardly through said disks, fixed supporting-tracks with ball-bearing devices by which the frame is supported upon said tracks and mechanism by which the frame is caused to oscillate transversely, and screws connected therewith by which it is also advanced in the direction of the screws during its oscillations.

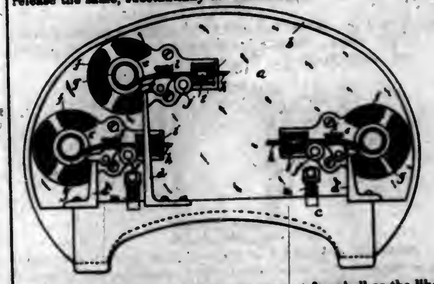
9. In a device for grinding and polishing, a main frame adjustably suspended at one end, grinding or polishing disks journaled at the opposite end and movable over the surface to be ground, a suspending yoke or frame having antifrictional bearings, fixed guides or tracks upon which these bearings are movable, horizontal screw-shafts passing through nuts which are connected with the hanger and mechanism by which the screw-shafts are rotated whereby the hanger is caused to move in the line of the supporting-tracks whereby the grinding or polishing disks are advanced in one direction, a yoke slidable between the tracks and prevented from transverse motion thereby, a crank-wheel or eccentric journaled upon the hanger, with a pitman connecting the yoke with its crank whereby the main frame and disks are caused to oscillate transversely while being advanced

by the screws, and a jointed shaft through which motion is transmitted to the crank-wheel without throwing the driving mechanism out of engagement.

602,214. CONTINUOUS MILEAGE-TICKET. JOHN P. EASTMAN, Chicago, Ill., assignor of one-half to Fred M. Lewis, same place. Filed Sept. 20, 1897. Serial No. 652,284. (No model.)

Claim.—1. A ticket of the class described folded along a line, preferably perforated, lengthwise of said ticket intermediate between its edges, and then folded crosswise at intervals, forming a series of pages, connected at the ends, adapted to be drawn out in a continuous ticket, substantially parallel lines across said first line indicating units of distance, and characters representing units of distance corresponding to said transverse lines on each side of said first line and adjacent thereto, substantially as described.

2. A ticket of the class described folded lengthwise between its edges, and then folded crosswise at intervals, forming a series of pages, connected at the ends, adapted to be drawn out in a continuous ticket, a series of lines and corresponding figures representing units of distance on each side of said fold first mentioned and adjacent thereto, substantially as described.



3. In a ticket of the class described, the combination of a cover adapted to hold and protect said ticket, a ticket attached thereto having a fold along its length, and then folded crosswise at intervals, forming a series of pages, connected at the ends, adapted to be drawn out in a continuous ticket, a series of substantially parallel lines and figures corresponding thereto representing units of distance on each side of said first-mentioned fold and adjacent thereto, and a blank space to one side for the holder's signature, substantially as described.

4. The combination of a ticket of the class described having a line, preferably perforated, lengthwise of said ticket intermediate between its edges, substantially parallel lines across said first line indicating units of distance, characters representing units of distance corresponding to said transverse lines adjacent to said first line, in combination with a cover adapted to hold and protect the ticket, said ticket being first folded along said first-mentioned line, and then folded crosswise at intervalvs forming a series of pages, connected at the ends, adapted to be drawn ont in a continuous ticket, substantially as described.

5. In a ticket of the class described, the combination of the cover adapted to hold and protect the ticket, a ticket folded lengthwise between its edges attached thereto, a series of substantially parallel lines and figures corresponding thereto on each side of said fold and adjacent thereto, the fold being so proportioned that the back of one portion will project outside of the other portion and provide a space for the holder's signature, substantially as described.

602,215. DEVICE FOR AMUSING CHILDREN. EDWIN L. FOSTER, Springfield, Mass., assignor of one-half to Thomas B. King, same place. Filed Mar 22, 1897. Serial No. 628,657. (No model.)

Claim.—1. The combination of a tray or support for a ball or the like, a returning device mounted therein, a cord extending from the returning device through an opening in the tray the free end of the cord, or a ball or other article attached thereto, being adapted to rest upon the tray, a stop device in proximity to which the cord passes, said stop automatically checking the return of the cord, when drawn out, to the returning device, and a tripping device, mounted in said tray, having operative connection with said stop device to release the same, substantially as described.

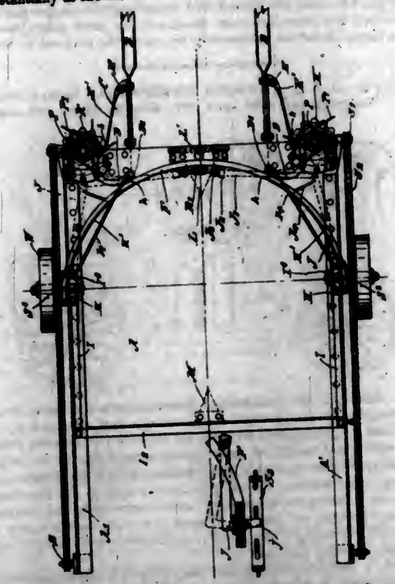
2. The combination of a tray or support for a ball or the like, a cord arranged therein, a returning device to which the cord is attached, a stop device and a tripping device to release the stop, normally extending beyond the edge of the tray, and arranged to be operated by pressure against the edge thereof, substantially as described.

3. The combination of a tray, a movable piece c arranged therein, a returning device, a cord extending from the returning device through the wall of the tray, a stop device arranged between the returning device and the free end of the cord and means extending from the movable piece c to the stop device whereby the stop device may be operated allowing the returning device to operate, substantially as shown.

4. The combination of a tray or support for a ball or other toy, a returning device mounted therein, a cord extending therefrom, and passing through an aperture in the tray, a pulley arranged near said aperture to change the direction of said cord from horizontal to vertical, a stop device for automatically holding said cord when drawn out, and a tripping device for releasing said stop device, arranged to be actuated from the edge of the tray, substantially as described.

5. The combination of a suitable support, a movable piece c arranged therein, springs arranged to maintain the piece c in its normal position, a cord, a returning device therefor, a stop to engage the cord and prevent return movement and a tripping-rod extending from the piece c to the stop whereby the cord is released when the piece c is operated, substantially as and for the purposes stated.

6. The combination of a toy-tray, a supplementary tray having a recess below its bottom to set over and clear toys or toy-cords resting on the lower tray, latches extending upward from the toy-tray, and having overhanging fingers for grasping the supplementary tray, and springs for pressing said latches down upon said supplementary tray when the latter is in position, substantially as described.



7. The combination of a toy-tray, a supplementary tray having its bottom raised to clear toys on the lower tray, and spring-actuated fingers extending from one of said trays and over the edge of the other tray and holding the two together, substantially as described.

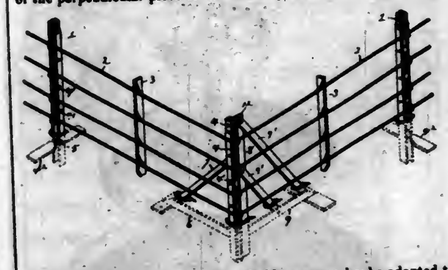
602,216. CORN-HARVESTER. GEORGE GOWEN, Chicago, Ill. Filed Dec. 24, 1896. Serial No. 616,980. (No model.)

Claim.—1. The combination of a platform on which the stalks are carried as gathered; of draft devices attached to the platform; with a frame mounted upon traction-wheels, and said platform movable in relation to the frame; said frame provided with means for supporting the stalks on the platform in an upright position and for stripping the stalks from the platform, means for locking and unlocking the frame to and from the platform, and means for locking and unlocking the wheels for the purpose described.

2. The combination of a supporting-platform for the stalks, of draft devices attached to the platform with a frame, in relation to which the platform is movable, provided with means for supporting the stalks upon the platform and for stripping them from the platform, means for locking and unlocking the platform to and from the frame, and means for locking and unlocking the frame in a fixed position in relation to the ground during the stripping of the stalks from the platform, for the purpose described.

3. The combination of the platform for supporting and carrying the stalks, of draft devices attached thereto, and of devices attached to the platform for cutting the stalks, of devices fixed to the platform for supporting the stalks in an upright position during the cutting; with a frame for supporting the platform mounted upon traction-wheels in a manner that the platform is movable in relation thereto, and said frame carrying devices for supporting the stalks while being gathered, and for removing the stalks when gathered, substantially as shown.

4. The combination of the platform mounted upon a frame, and adapted to slide in relation thereto, said frame consisting of the curved axle bars F, one of them curving forward over the surface of the platform, and posts H fixed to the axle-frame, and the tilting-frame bar I[a] pivoted to said posts with means for moving the platform in relation to the frame whereby the frame strips the stalks from the platform, in the manner shown and for the purpose described.



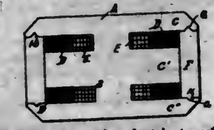
5. The combination of the platform for supporting the stalks while being gathered, of devices mounted upon the platform for cutting the stalks, of draft devices attached to the platform; with a framework suitably mounted upon traction-wheels, said platform sliding in relation to the said framework, means for locking the said framework in a position relative to that of the platform, and means for locking the traction-wheels of the frame simultaneously with the unlocking of the framework and platform, with a tilting frame fixed to the traction-wheel frame and moved therewith for supporting the stalks in an upright position on the platform while being gathered, means connected to the platform whereby by the movement of the platform in relation to the axle-frame the tilting frame is tilted clear of the stalks upon the platform permitting them to be discharged in an upright position, substantially as shown and described.

6. The combination of the platform A, of draft devices attached thereto, of devices mounted on said platform for cutting the stalks, with a traction-wheel frame mounted in a manner that the platform may slide in relation to the frame, and comprising the curved axle-bars F, and the levers J pivoted to the axle-frame in the manner shown, provided with projections for engaging the traction-wheels arresting their motion in the manner shown and for the purpose described.

7. The combination of the platform A, having the draft devices thereto attached, provided with rearwardly-extending arms A', with a traction-wheel frame mounted in a manner that the platform may slide in relation thereto, said frame having a curved bar F crossing the top surface of the platform, in the manner shown, said platform adapted to slide forwardly in relation to the frame and be supported in its forward position by the extending arm A' whereby the curved arm F is permitted to sweep the entire surface of the platform in order to free the stalks entirely therefrom, in the manner shown and for the purpose described.

602,217. FENCE. GEORGE B. GUNN, Camden, Tenn. Filed Sept. 7, 1897. Serial No. 650,703. (No model.)

Claim.—1. In a fence, the combination of a post adapted to be located at the corner, said post consisting of two vertical pieces, blocks located at suitable intervals between said pieces and retaining them at their proper distance apart, an anchor located near the lower end of said post, said anchor being adapted to be buried beneath the surface of the ground, a brace connecting said anchor with the upper portion of the post, an auxiliary brace adapted to be placed opposite the corner of the post, said auxiliary brace consisting of a perpendicular piece adapted to come in contact with the side of the post, an anchor fixed to the lower part of said piece, said anchor being buried in the ground, braces connecting said anchor with the upper portion of the perpendicular piece of the auxiliary brace.



2. In a fence, a post having suitable recesses, hooks adapted to be secured in said recesses, the said hooks adapted to surround the wires and clamp them against the edges of the post, the upper ends of the hooks coming in contact with the edges of the post and thus preventing bowing of the wire.

3. In a fence, a post consisting of two vertical pieces and retained at suitable distances apart, a hook adapted to be secured between said pieces, said hook adapted to surround the wire and clamp the same against the edges of the pieces, the upper end of the hook being broader than the space between the pieces forming the post, the upper end of the hook being adapted to come in contact with the edges of the pieces.

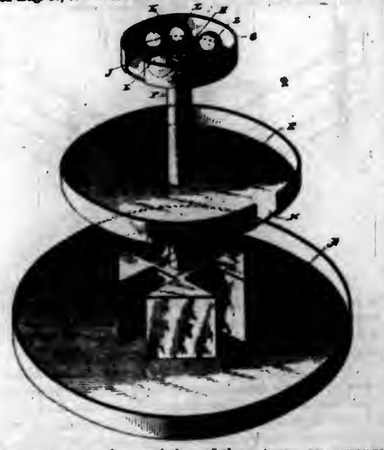
4. In a fence, a post consisting of vertical pieces retained at suitable distances apart, hooks adapted to be located between said pieces, said hooks having their inner faces serrated, the serrated faces adapted to surround the wires and clamp them against the edges of the post, the upper ends of the hooks adapted to come in contact with the edges of the pieces forming the post.

602,218. ELECTRIC TRANSFORMER. LUDWIG GUTMANN, Pittsburg, Pa. Filed Oct. 31, 1890. Serial No. 369,980. (No model.)

Claim.—1. A core element for electric transformers consisting of a plate of magnetic material, two recesses or more provided in said plate for locating the transformer-windings, polar projections caused by said recesses, and a second plate or strip of magnetic material interlocking with the polar projections of the plate named first.

2. A core element for electric transformers or similar translating devices consisting of a plate of magnetic material, two or more recesses in said plate causing extensions, and a strip or plate adapted to interlock with said extensions, as and for the purpose described.

3. A core element for electric transformers consisting of a plate or lamina of magnetic material, two or more recesses in said plate, a second plate adapted to bridge said recesses and means for interlocking the said plates, as and for the purpose described.



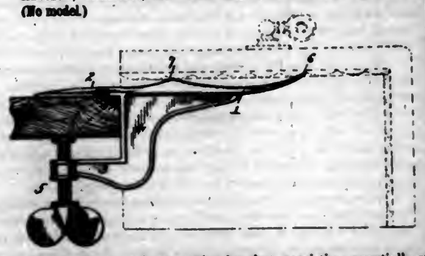
4. In an electric converter the combination with the windings of a laminated core provided with two or more recesses, adapted to admit the windings of said converter and causing extensions or projections, a second set of recesses and projections located in or on the first-named projections, and one or more blocks or wedges located in the second set of recesses and projections, for the purpose described.

5. In an electromagnetic device the combination with energizing-windings of a core, recesses in said core for retaining said winding or windings, projections caused by said recesses forming polar extensions, a second set of recesses located in said polar extensions and blocks or wedges of any suitable magnetic material, located and retained in the recesses last named for establishing a magnetic path from one pole to the other.

6. In an electromagnetic device the combination of a core, recesses provided in said core forming extensions on either side of each

recess, energizing windings or conductors located in said recesses, and partially or completely embedded in said core, a second set of recesses located in the core extensions or poles, and wedges of magnetic material located nearer to the surface or periphery than the winding and retained in the recesses last named, magnetically short-circuiting the poles formed by said extensions, or considerably reducing the magnetic resistance.

602,219. PUZZLE. WILLIARD A. HALLENBECK, Hudson, N. Y. Filed Aug. 17, 1897. Serial No. 648,484. (No model.)

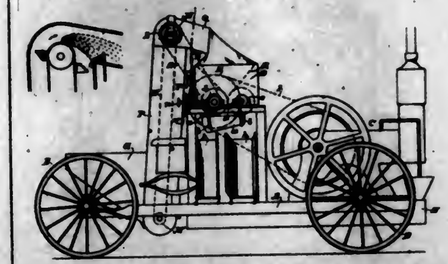


Claim.—1. A puzzle, consisting of three trays, one arranged above the other, each of less diameter than the one next beneath, the two upper trays having openings cut in their rims, and a block having stalls therein located in the lower tray, as specified.

2. As a new article of manufacture, a puzzle, consisting of three circular trays, each of less diameter than the one next beneath, the two trays having openings cut in their rims, a block having stalls formed therein located in the lower tray, and posts upon which the trays are supported, all arranged substantially as and for the purpose set forth.

3. In combination, three circular trays arranged one above the other, each of less diameter than the one next beneath, the two upper trays having openings formed in their rims, a block having stalls formed therein located in the bottom tray, posts D and F for supporting the upper trays, a rod passed through the several members of the device for holding them in place, and four balls to be placed in the upper tray and transferred one by one to the stalls in the lower tray, as specified.

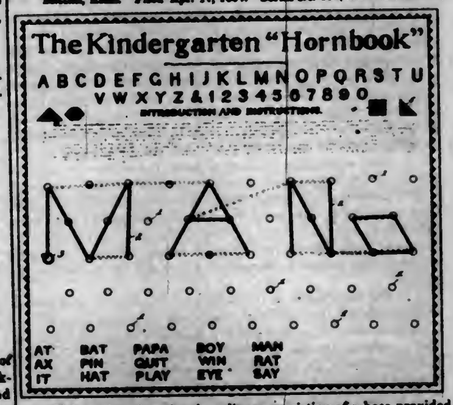
602,220. WORK-SUPPORT FOR CASKETS, &c. ROBERT B. HEDGMAN, Commerce, Mo. Filed May 4, 1897. Serial No. 635,082. (No model.)



Claim.—1. A work supporting bracket, consisting essentially of an arm provided at one end with means for attaching it to a work-beach or other support and having its other end bent upward and terminating in a reduced supporting-point, said arm also being provided on its upper side near the attaching means with a raised supporting portion in approximately the same plane with the supporting end of the arm, as and for the purposes set forth.

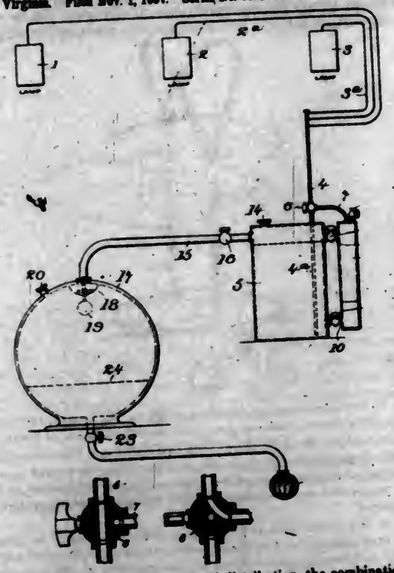
2. A work-support for supporting caskets and other hollow articles, consisting of an arm provided with means for attaching it to a work-beach and supporting it in a substantially horizontal position, said arm having on its upper side two raised supporting portions, one near each end, said two supporting portions lying in substantially the same horizontal plane, as and for the purposes set forth.

3. A work-support for hollow articles, consisting of an arm provided at one end with a clamping device adapted to support it in a substantially horizontal position in front of the work-bench or other support, said arm being provided on its upper side with a supporting-surface near each end thereof, said supporting-surfaces being in substantially the same horizontal plane and in a place above that of the clamping device, substantially as and for the purposes set forth.



602,221. PORTABLE CRUSHING-MILL. HENRY L. JESSUP, Watsonville, Cal. Filed Apr. 6, 1897. Serial No. 630,917. (No model.)

Claim.—1. The combination, of crushing-rolls and means for actuating the same, an elevator-casing having a discharge-spout at one end and a regulated feed-supply at the opposite end, a bucket elevator within said casing and means actuating the same from one of the crushing-rolls, an adjustable gate operating through the elevator discharge-spout between the upper end of the elevator and the crushing rolls whereby the centrifugal impulse imparted by the elevator at its discharge end and the adjacent gate regulates the supply to the rolls according to the speed of the elevator, and means for adjustably securing said gate.



2. A portable crushing mill comprising in a single structure, a wheeled base or support; a driving-motor thereon; an elevator and complementary crushing and separating mechanisms, mounted on said base and operated by said motor; a gate interposed in the feed-passage between the upper end of the elevator and the crushing devices whereby the centrifugal impulse imparted by the elevator in the half-circle traversed at the upper end, and the adjustment of said gate, determines the distribution of the material to the crushing devices according to the speed of the elevator, and means for adjusting the gate.

602,222. EDUCATIONAL APPLIANCE. SAMUEL KIMBLE, Manhattan, Kans. Filed Apr. 17, 1897. Serial No. 632,604. (No model.)

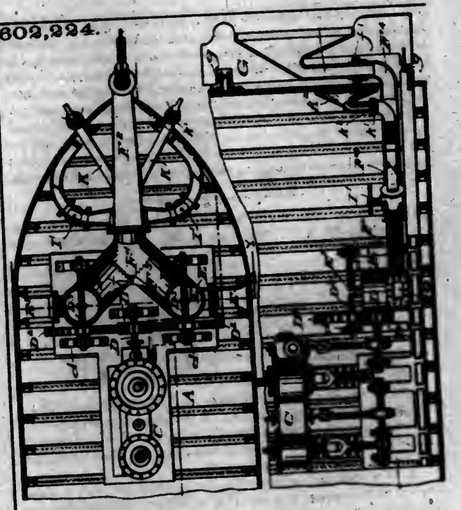
Claim.—An educational appliance consisting of a base provided with a group of indicating-points, arranged at uniform distances apart, any three adjacent points forming an equilateral triangle and a flexible cord permanently attached at one end to the base and adapted to be extended between said indicating-points and lie upon the face of the base to form letters and other characters, different characters being adapted to be formed at the same part of the base by connecting different indicating-points, substantially as specified.

602,223. SYSTEM AND APPARATUS FOR DISTRIBUTING FLUID. ARTHUR KITSON, Philadelphia, Pa., assignor to the Kitson Hydrocarbon Heating and Incandescent Lighting Company, of West Virginia. Filed Nov. 1, 1897. Serial No. 657,082. (No model.)

Claim.—1. In a system of fluid distribution, the combination of the service-pipes, a reservoir containing fluid under pressure, a drip-can having a valve-controlled connection to said reservoir, a drip-pipe which leads from the service system to the drip-can, and the valve or valves controlling said service system and drip-pipe, substantially as described.

2. In a system of fluid distribution the combination of the service-pipes, a reservoir containing fluid under pressure, a drip-can and connections from the reservoir thereto, means for subjecting the contents of the drip-can to pressure, a drip-pipe which leads from the service system to the drip-can, and the valve or valves controlling said service system and drip-pipe, substantially as described.

3. In a system of fluid distribution, the combination of the service-pipes, the reservoir containing fluid under pressure, the drip-can on the same level as the reservoir, the drip-pipe which leads from the service system to the drip-can, the valve or valves controlling said service system and drip-pipe, and the valve-controlled connection between the lower portion of the drip-can and the reservoir, substantially as described.



4. In a system of fluid distribution, the combination of the service-pipes, the reservoir containing fluid under pressure, the drip-can on the same level as the reservoir, the drip-pipe which leads from the service system to the drip-can, the valve or valves controlling said service system and drip pipe, and the valve-controlled connection between the lower portion of the drip-can and the reservoir, together with a connection by which the drip-can may be charged with compressed air, substantially as described.

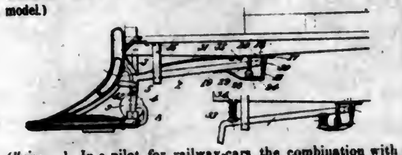
5. In a system of fluid distribution, the combination of the service-pipes, the reservoir containing fluid under pressure, the drip can on the same level as the reservoir, the drip-pipe which leads from the service system to the drip-can, the valve or valves controlling said service system and drip-pipe, and the valve-controlled connection between the lower portion of the drip-can and the reservoir, together with a valve controlled connection from the upper portion of the reservoir to the upper portion of the drip-can, substantially as described.

602,224. HYDROSTATIC VESSEL PROPELLING AND STEERING APPARATUS. FRIEDRICH KRUPP, Berlin, Germany. Filed Sept. 28, 1896. Serial No. 607,242. (No model.)

Claim.—A vessel propelling and steering apparatus, comprising a pump-cylinder, a water-induction pipe, a rudder-blade pivotally supported in the usual manner to the stern of the vessel, a discharge-pipe and a fan-shaped rudder discharge-nozzle journaled to the outer end of the discharge-pipe by flexible joints coincident with the pivotal axis of the rudder-blade, substantially as described.

602,224.

602,225. DUMP-CART. ARTHUR MAXWELL, Ludlow Falls, Ohio. Filed Oct. 27, 1897. Serial No. 656,558. (No model.)



Claim.—1. A dump-cart, comprising the thills, the rectangular frame 3', to which said thills are fixed in the same horizontal plane, the drop axle 5, formed with the integral parallel arms 6 6, and horizontal spindles 7 7, the wheels 8 8, mounted on said spindles, in combination with the body 4, the transverse block 15, fixed to the bottom of said body and provided with the semicircular groove 17, in which the axle is mounted, the transverse bar 18, fixed to the front end of the body and provided with the integral forwardly-projecting toe 19, and the forwardly-projecting brackets 20 20, secured to the forward ends of the sides of said body, substantially as shown and described.

2. A dump-cart comprising the thills, the rectangular frame 3', the horizontal knees 4' 4', connecting said thills and frame, the drop-axle 5, having the integral spindles 7 7, the wheels 8 8 mounted on

said spindles, the hand-lever 9, fixed to said axle 5, and provided with the hinged pawl 10, the semicircular rack 14, fixed to said rectangular frame with a detent 12, located in the path of said pawl in combination with the body 4, the transverse block 15, fixed to said body and provided with the groove 17, forming a bearing for said axle, the transverse bar 18, fixed to the forward end of said body and provided with a horizontal projecting toe 19, and the forwardly-projecting brackets 20 20, secured to the forward end of the body, said toe and brackets adapted to engage the rectangular cart-frame and retain the body in a horizontal position, substantially as shown and described.

602,226. PILOT FOR RAILWAY-CARS. ELTHERA P. MCKAIG, Richmond Hill, N. Y. Filed June 1, 1896. Serial No. 593,855. (No model.)

Claim.—1. In a pilot for railway-cars, the combination with a frame adapted to be secured to a car, of an inflatable protective cushion carried upon the forward part of the frame, and an air-reservoir also carried on the frame and communicating with the cushion supplied with air, substantially as set forth.

2. In a pilot for railway-cars, the combination with a frame adapted to be secured to a car, of a protective inflatable covering extending over the entire front portion of the frame, substantially as set forth.

3. In a pilot for railway-cars, the combination with a frame adapted to be secured to the car, of a protective inflatable covering extending over the entire front portion of the frame, and an air-reservoir communicating with the inflatable covering, substantially as set forth.

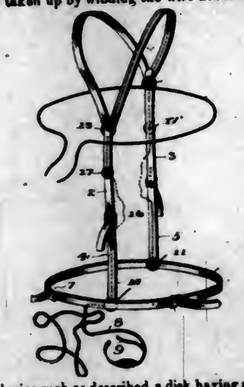
4. In a pilot for railway-cars, the combination with a frame adapted to be secured to a car, of a protective inflatable covering extending over the entire front portion of the frame, and an air-reservoir communicating with the inflatable covering and carried upon the frame, substantially as set forth.

5. In a pilot for railway-cars, the combination with a frame and air-supply reservoir thereon, of an inflatable apron carried upon the forward part of the frame, a perforated reservoir within the same, and a pipe uniting the perforated reservoir to the air-supply reservoir, substantially as set forth.

6. The combination with a railway-car, brackets and slotted hinged plates upon opposite sides thereof, of a pilot-frame provided with side frame-pieces entering, respectively, the slots in the hinged plates, enlarged ends upon the frame side pieces, and means for supporting the forward ends of the frame side pieces, substantially as set forth.

7. The combination with a railway-car, brackets and hangers upon opposite sides thereof, respectively, and frame side pieces, of a bolt passing through the hangers, enlarged ends upon the frame side pieces, a slotted hinged plate in each of the brackets adapted to engage the side frame pieces, respectively, means for fastening the hinged plates, and oppositely-acting springs secured to the car and acting upon the top and bottom, respectively, of the side frame-pieces, substantially as and for the purpose specified.

602,227. PROCESS OF FABRICATING METALLOCERAMIC RESISTANCES. LOUIS PARVILLÉE, Paris, France. Filed Nov. 13, 1897. Serial No. 658,450. (No specimens.) Patented in France Sept. 24, 1896, No. 270,952, and in Germany Dec. 1, 1896, No. 94,293.



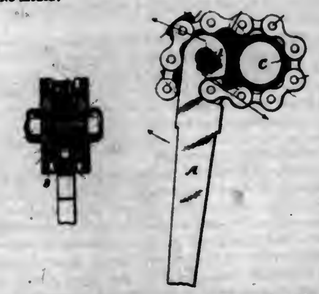
Claim.—1. The herein-described process of making metalloceramic resistances for electrical purposes consisting in mixing a metallic powder with extraneous bodies such as quartz, kaolin, clay or feldspar and with a flux, subjecting the whole to pressure and then firing the same, substantially as described.

2. The herein-described metalloceramic resistance consisting of a metallic powder, crushed quartz, kaolin and a flux, substantially as described.

3. The herein-described metalloceramic resistance consisting of powdered nickel, crushed quartz, kaolin combined with a flux consisting of silica, carbonate of lead and calcined borax all in substantially the proportions specified.

602,228. REMEDIAL APPLIANCE. JOHN R. PETERSON, Washington, D. C. Filed May 19, 1897. Serial No. 637,259. (No model.)

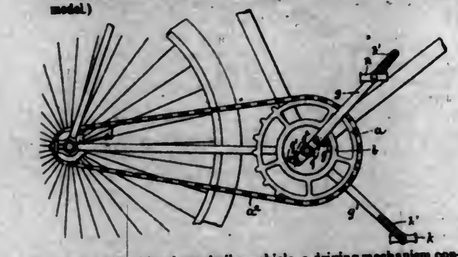
Claim.—1. A device such as described consisting of suitable disks, a webbing supporting said disks, a wire connecting all of the disks, said wire being secured to the webbing, the front and rear sections of the webbing having suitable means for adjustment, buttons fixed to the webbing above said means of adjustment, the wire being disconnected from the webbing about the means of adjustment, said wire also being slack about said means of adjustment and the slack adapted to be taken up by winding the wire about the buttons.



2. In a device such as described, a disk having an inner convexed plate and an outer concaved plate, said plates being secured together at their edges, the inner plate being perforated and the outer plate being adapted to be secured to the webbing of the device and a post attached to the inner side of the convexed plate and bearing at its end against the opposite plate, the disk being adapted to contain a compound.

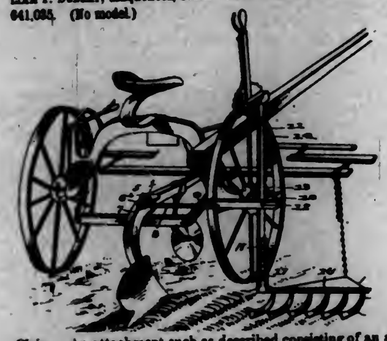
3. In a device such as described, a disk consisting of an inner convexed plate and an outer concaved-convexed plate, the inner plate being perforated, a post secured to the inner side of the convexed plate, said post being internally threaded and bearing at its ends against the convexity of the concaved-convexed plate, a screw passing through the webbing of the device and being located at its end in the threaded interior of the post.

4. In a device such as described, a suitable webbing made in sections with means for adjusting and a wire connected to said webbing, a button adapted to take up the slack in the wire, said button having about its periphery an annular recess, and a depression located in its under side, said button having a central perforation, a screw passing through said perforation and through the webbing, a tap adapted to secure the bottoms to the webbing, said tap when in place being located within the lateral depression of the button.



602,229. PIPE-WRENCH. THOMAS M. RIGHTER and GEORGE JEFFRYES, Mount Carmel, Pa. Filed Dec. 13, 1897. Serial No. 661,655. (No model.)

Claim.—1. In a pipe-wrench, the combination of a lever, a pivot-bolt passing through the lever, a pair of jaws fixed upon and adapted to rotate with said bolt, toothed recesses in the periphery of said jaws, slots in the inner faces of the jaws between the recesses, and a chain connected with the lever and provided with pins adapted to engage the slots in the jaws, substantially as described.



2. A pipe-wrench comprising a lever or handle, a pivot-bolt free to turn in an opening in said handle, a pair of circular jaws arranged upon the bolt on opposite sides of the handle, inclined slots in the inner faces of said jaws, said slots extending inward from the periphery and being inclined to the radii, a chain connected with the handle near the pivot-bolt, said chain having pins projecting from the sides thereof adapted to be seated in the inclined slots of the jaws, substantially as described.

602,230. PROPELLING MECHANISM FOR BICYCLES. IRA W. CORNELYEA, Newark, N. J. Filed Aug. 5, 1896. Serial No. 601,712. (No model.)

Claim.—In a bicycle or similar vehicle, a driving mechanism consisting of a driving-sprocket, a ratcheted disk secured thereto, a second disk, a sleeve securing said disks together, a hanger, a pin or shaft fixed to said hanger and forming a bearing for said sleeve, two treadle-arms, each oscillating upon said fixed shaft, a pawl mechanism connecting each treadle-arm with one of said disks, and two springs each fixed at one end to the pin or shaft and adapted to elevate each treadle-arm, substantially as described.

602,231. PULVERIZING ATTACHMENT FOR PLOWS. WILLIAM F. DUNLAP, Maquoketa, Iowa. Filed June 16, 1897. Serial No. 641,095. (No model.)

Claim.—An attachment such as described consisting of an angular piece adapted to be secured to the plow-beam, a spring-rod pivoted to said angular piece, a lever fulcrumed to the outer end of said rod, a means for securing said lever in a desired point in its path, a bar carrying a number of blades, said bar being adjustably secured to the end of said lever the blades on said bar adapted to come in contact with the ground, a bail attached to the forward edge of said bar, a flexible connection connecting said bail with a stationary point of the plow.

602,232. LOCK-NUT. BUTLER EDGAR, Sunbury, Pa., assignor to Thomas M. Righter, trustee, Mount Carmel, Pa. Filed Aug. 26, 1897. Serial No. 649,617. (No model.)

Claim.—A self-locking nut, having a kerf in one side partially severing it on a plane substantially parallel with its upper and lower faces and having the portion above said kerf set inward, the portion of the hole in the nut below the kerf being circular and the portion above being reduced in one of its diameters, whereby the set-in portion is adapted to grip the bolt, substantially as described.

602,233. NUT-LOCK. BUTLER EDGAR, Sunbury, Pa., assignor to Thomas M. Righter, trustee, Mount Carmel, Pa. Filed June 9, 1897. Renewed Mar. 3, 1898. Serial No. 673,143. (No model.)

Claim.—1. The combination of a threaded bolt or rod, a nut, and a part to be clamped, one of the opposing faces of the nut and clamped part having one or more tapering tangential grooves opening at their larger ends at the sides of the nut, and a hard ball adapted to fit in one of said grooves and to bear against the opposing face when the nut is screwed up to said part, substantially as described.

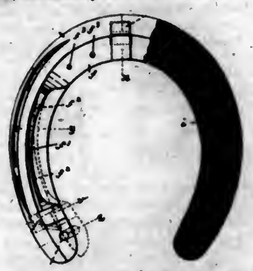
2. The combination of a threaded bolt or rod, a nut, and a part to be clamped, one of the opposing faces of the nut and clamped part having one or more tapering tangential grooves opening at both ends at the sides of the nut, and a hard ball adapted to fit in one of said grooves and to bear against the opposing face when the nut is screwed up to said part, substantially as described.

602,234. SINGLE-PIECE SHEET-METAL HANDLE. JOHN W. GREER, Manchester, N. Y. Filed May 5, 1897. Serial No. 635,278. (No model.)

Claim.—A single-piece sheet-metal handle consisting of a blank having its longitudinal edges formed up and locked together at the upper side of the handle, thus forming a longitudinal seam extending along the upper side of the handle, recesses cut at the lower end of the body portion of the handle, said recesses adapted to receive the upper edge of the utensil, a lip extending into the utensil and being secured to the inner side thereof, a fold extending through the longitudinal axis of the lip, a flange extending from the lower end of the body portion of the blank, said flange adapted to be secured to the outer side of the utensil, a transverse fold pitching said flange at the proper angle to the handle.

602,235. ELECTRIC-CORD-ADJUSTING DEVICE. FRANCIS H. LAWTON, Summit, N. J. Filed Apr. 5, 1897. Serial No. 630,737. (No model.)

Claim.—1. The combination of flexible insulated electric conducting-cords with an adjusting device therefor consisting of a wire, rod or form of metal having a smooth, curved, contact-surface, said wire being bent or crimped into a series of successively-reversed loops, and having a layer or coating of insulating material on its surface; said flexible cord being intertwined with said adjusting devices, substantially as described.

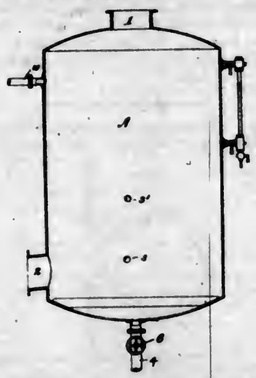


2. An adjusting device for flexible insulated conducting-cords consisting of a metal wire, rod or form of metal having a smooth, curved exterior surface, bent or crimped into a series of successive loops arranged in the same plane, and a layer or coating of insulating vitreous enamel thereon, substantially as described.

602,236. ELASTIC HORSESHOE. THOMAS M. MILLER, Bethlehem, Pa., assignor of one-half to J. Walter Levatt, same place. Filed Aug. 6, 1897. Serial No. 647,231. (No model.)

Claim.—1. A horseshoe comprising a hoof-plate, a horseshoe-shaped band removably arranged on said hoof-plate and having its quarters bent at right angles to itself, an elastic block carried by said band and its quarters and extending to the outer edge of the hoof-plate, and means for removably securing said band and elastic block to the hoof-plate, substantially as and for the purposes described.

2. A horseshoe comprising a hoof-plate, a horseshoe-shaped band removably secured to said hoof-plate and having its quarters bent at



right angles to itself, and an elastic horseshoe-shaped block carried by said band and its quarters and conforming in shape to the shape of the hoof-plate, substantially as and for the purposes described.

3. A horseshoe comprising a hoof-plate provided on its under inner portion with a rabbet and at its toe and heels with openings and adjoining recesses, a band in said rabbet and provided with outwardly-projecting lugs penetrating the said openings and engaging their respective recesses, and an elastic block carried by said band and substantially conforming in shape to the shape of the hoof-plate, substantially as and for the purposes described.

4. A horseshoe comprising a hoof-plate provided at its under inner portion with a rabbet, a horseshoe-shaped band removably arranged in said rabbet and having its quarters bent at right angles to itself, an elastic block carried by said band and its quarters and extending to the outer edge of the hoof-plate, and means for removably securing said band and elastic block to the hoof-plate, substantially as and for the purposes described.

602,237. PROCESS OF AND APPARATUS FOR UTILIZING HORN OR SIMILAR MATERIAL. ALEXANDER MITSCHERLICH, Freiburg, Germany. Filed Nov. 26, 1895. Serial No. 570,216. (No model.)

Claim.—1. The herein-described process for producing adhesive and sizing material from waste ceratin matters, consisting in dissolving the ceratin matter in water under pressure and at a temperature above 100° centigrade; then acidifying the solution and treating the same with lye from the sulfite-cellulose process, or the tanning principle thereof, for the production of a precipitate practically insoluble in water: then dissolving the precipitate in a soda solution, and, finally, concentrating the solution.

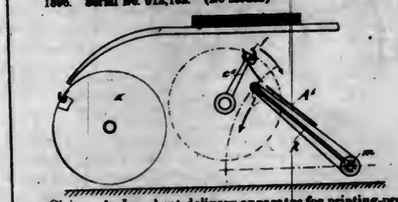
2. The herein-described process for producing adhesive and sizing material from waste ceratin matters, consisting in dissolving the ceratin matter in water under pressure and at a temperature above 100° centigrade: then acidifying the solution and treating the same with lye from the sulfite-cellulose process, or the tanning principle thereof, for the production of a precipitate practically insoluble in water; then dissolving the precipitate in a soda solution, and precipitating the sizing matter by acids, acid salts, or salts of alumina.

3. The herein-described process for producing adhesive and sizing material from waste ceratin matters, consisting in dissolving the ceratin matter in water under pressure and at a temperature above 100° centigrade: then acidifying the solution and treating the same with lye from the sulfite-cellulose process, or the tanning principle thereof, for the production of a precipitate practically insoluble in water; then dissolving the precipitate in a soda solution, and precipitating the sizing matter directly in the paper-pulp by the addition of acids, acid salts, or salts of alumina.

4. The herein-described process for producing a pure compound of ceratin and tanning principle, consisting in dissolving waste ceratin matter in water under pressure and at a temperature above 100° centigrade; then mixing the solution with highly-diluted neutralized sulfite lyes, or the tanning principle thereof, and, then precipitating the compound with acids, acid salts, or salts of alumina.

5. The herein-described process for producing adhesive and sizing material from waste ceratin matters, consisting in dissolving the latter in water under pressure and at a temperature above 100° centigrade; then drawing off the liquid and treating the residue with a diluted caustic-soda solution.

6. The herein-described process for producing adhesive and sizing material from waste ceratin matters, consisting in dissolving the latter in water under pressure and at a temperature above 100° centigrade, then drawing off the liquid and treating the residue with a diluted soda solution in the presence of lime.



7. The herein-described process for producing adhesive and sizing material from waste ceratin matters, consisting in treating the finely-divided raw ceratin matter, or the masses last separated, with acidified sulfite-cellulose lye until it becomes soluble in a soda solution.

8. The herein-described process for producing adhesive and sizing material from waste ceratin matters, consisting in dissolving the ceratin matter in water under pressure and at a temperature above 100° centigrade; then acidifying the solution and treating the same with lye from the sulfite-cellulose process, or the tanning principle thereof, for the production of a precipitate practically insoluble in water, and dissolving the precipitate in a soda solution.

9. The herein-described method for producing a clear solution of ceratin matters, consisting in dissolving the matter in water under pressure and at a temperature above 100° centigrade by inducing a slow current of water to flow through the mass from above downward in a closed vessel and passing the solution through a filter.

10. The filter herein described consisting of a bottom provided with outlets, a plaited filter-cloth provided with bearings and intermediate pieces allowing the free passage of liquid, laths secured to the filter-bottom and clamping the filter-cloth, and stone plates—all constructed and arranged for working under high pressures, substantially as described.

602,238. SHEET-DELIVERY MECHANISM FOR PRINTING-MACHINES. ERNST NIETER, Nuremberg, Germany. Filed Nov. 16, 1896. Serial No. 612,182. (No model.)

Claim.—1. In a sheet delivery apparatus for printing-presses, the combination of a revolving fly located at the rear of the impression-cylinder and provided with grippers adapted to take the printed sheet from the impression-cylinder and to hold the same in suspension under vibration, and means adapted to engage with the free end of the sheet from below while said sheet is suspended from the fly so as to receive said sheet with the unprinted side down, substantially as described.

2. In a sheet-delivery apparatus for printing-presses, the combination of a revolving fly provided with grippers adapted to take the printed sheet from the impression-cylinder, a displacer adapted to engage with the printed sheet while suspended from the fly, and a frame provided with delivery-tapes for receiving the printed sheet, substantially as described.

3. In a sheet-delivery apparatus for printing-presses, the combination of a revolving fly provided with grippers adapted to take the printed sheet from the impression-cylinder, a vibratory displacer adapted to engage with the printed sheet while suspended from the fly to deflect the sheet, and a rocking frame adapted to move upwardly to receive the sheet when deflected, and provided with delivery-tapes, substantially as described.

4. In a sheet-delivery apparatus for printing-presses, the combination of a revolving fly provided with grippers adapted to take the printed sheet from the impression-cylinder by its leading end and to hold the same in suspension, and a rocking frame adapted to move upwardly to receive the following end of the sheet while suspended from the fly, and provided with delivery-tapes, substantially as described.

602,289. AERIAL RAILWAY. MARTIN A. DE PALACIO, Madrid, Spain. Filed Dec. 20, 1897. Serial No. 662,530. (No model.) Patented in Spain July 6, 1896, No. 17,455; in France Aug. 22, 1896, No. 249,812; in Belgium Aug. 22, 1896, No. 117,108; in Switzerland Aug. 22, 1896, No. 10,967; in Germany Aug. 26, 1896, No. 91,356, and in Sweden Sept. 19, 1896, No. 3,056.

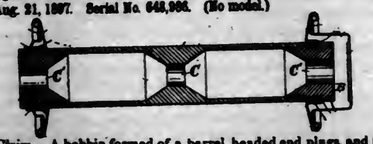
Claim.—1. An aerial railway comprising in combination a line of rails spliced end to end, parallel suspension-cables, pairs of clamping-plates clamping these cables at intervals, eyebolts secured to the two plates of each pair, suspension-rods hooked to the eyebolts and secured to the rails, and pillars supporting at intervals the suspension-cables and the line of rails which take between the said pillars their respective curves of equilibrium, substantially as herein described.

2. An aerial railway comprising in combination a line of rails spliced end to end, and pillars which rest upon the ground in transverse lines about which they may oscillate and which serve to support at intervals the line of rails which takes between the said pillars its curve of equilibrium, substantially as herein described.

3. An aerial railway comprising in combination a line of rails spliced end to end, one or more suspension-cables, means for suspending the line of rails from said cables, and pillars which rest upon the ground in transverse lines about which they may oscillate and which support at intervals the suspension-cables and the line of rails which take between the said pillars their respective curves of equilibrium, substantially as herein described.

4. An aerial railway comprising in combination a line of rails of U-shaped transverse section spliced end to end, a rack located in the throat of the U of the rail, and pillars supporting at intervals the line of rails which takes between said pillars its curve of equilibrium, substantially as herein described.

5. An aerial railway comprising in combination a line of rails of U form spliced end to end, a rack located in the throat of the U of the rail, one or more suspension-cables, means for suspending the line of rails from said cables, and pillars for supporting at intervals the suspension-cables and the line of rails which take between said pillars their respective curves of equilibrium, substantially as herein described.



6. An aerial railway comprising in combination a line of rails of U-shaped transverse section spliced end to end, a rack located in the channel of said rails, pillars for supporting at intervals the line of rails which takes between said pillars its curve of equilibrium, carriages the wheels of which run upon the vertical branches of the U-shaped rails and are furnished with teeth engaging with said rack, and vehicles suspended from these carriages, substantially as herein described.

7. An aerial railway comprising in combination a line of rails of U-shaped transverse section spliced end to end, a rack located in the channel of the U-shaped rail, an electric conductor following the line of rails, and insulated therefrom, pillars for supporting at intervals the line of rails which takes between them its curve of equilibrium, carriages the wheels of which run upon the vertical branches of the U-shaped rail and are furnished with teeth engaging with the rack, a vehicle suspended from these carriages, an electric motor in the said vehicle, a trolley for furnishing to the said motor the current which circulates in said electric conductor, and means for transmitting motion from the motor to the wheels above mentioned, substantially as described.

8. An aerial railway comprising in combination a line of rails of U-shaped transverse section spliced end to end, a rack located in the channel of the U-shaped rail, one or more suspension-cables, means for suspending the line of rails from said cables, pillars for supporting at intervals said cables and the line of rails which take between the pillars their respective curves of equilibrium, carriages the wheels of which run upon the vertical branches of the U-shaped rails and are furnished with teeth engaging with said rack, and vehicles suspended from these carriages, substantially as herein described.

9. An aerial railway comprising in combination a line of rails of U-shaped transverse section spliced end to end, a rack located in the channel of the U of the rail, one or more suspension-cables, means for suspending the line of rails from said cables, pillars for supporting at intervals the suspension-cables and the line of rails which take between said pillars their respective curves of equilibrium, an electric conductor following the line of rails and insulated therefrom, carriages the wheels of which run upon the vertical branches of the U of the rails and are furnished with teeth engaging with the rack, a vehicle suspended from these carriages, an electric motor in the vehicle, a trolley for furnishing to the motor the current which circulates in said electric conductor, and means for transmitting motion from the said motor to the above-mentioned wheels for the purpose of driving them, all substantially as herein described.

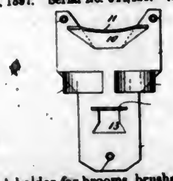
602,240. BOBBIN. GORDON PENDLETON, Jr., Carbondale, Pa., assignor to the Pendleton Manufacturing Company, same place. Filed Aug. 21, 1897. Serial No. 648,966. (No model.)

Claim.—A bobbin formed of a barrel, headed end plugs, and metallic heads each formed of an inner and an outer piece of sheet metal fastened together at their peripheries, the inner head-piece being formed with a collar fitted around the end of the barrel, and an inward-projecting flange bound between the end of the barrel and the head of the plug and the outer head-piece being bent outward axially at its inner edge to form a collar fitting around the head of the end plug.

602,241. BOBBIN. GORDON PENDLETON, Jr., Carbondale, Pa., assignor to the Pendleton Manufacturing Company, same place. Filed Aug. 26, 1897. Serial No. 649,681. (No model.)

Claim.—1. A bobbin formed of a barrel, end plugs formed with peripheral flanges and with annular recesses within which the ends of the barrel are fixed and a metal reinforcement covering the inner face of each flange, its outer edge bent around the edge of the flange and its inner edge bent axially at an angle to form a flange or collar bound between the periphery of the barrel and the outer wall of said recess.

2. A bobbin formed of a barrel, end plugs formed with peripheral flanges and with annular recesses within which the ends of the barrel are fixed, and a metal reinforcement covering the inner face and the outer edge of each flange, the inner edge of said metal being bent axially at an angle to form a collar or flange between the periphery of the barrel and the outer wall of said recess, and then again bent inward radially to form a flange bound between the end of said barrel and the bottom of said recess.



602,242. AIR-INDICATOR FOR BICYCLE-TIRES. WILLIAM R. RICHARDS, Wilkinsburg, Pa. Filed Aug. 26, 1897. Serial No. 649,154. (No model.)

Claim.—In an air-pressure indicator for bicycles and the like consisting of an air-inlet, a plug secured in the air-inlet, the opening in the plug communicating with the air-inlet, an air-cylinder secured

in said plug, said air-cylinder extending longitudinally of the bicycle-rim, and at a right angle to the air-inlet plug, a cap secured to said air-cylinder and provided with a central aperture, a smaller cylinder having a graduated glass scale secured in one side, a piston-head operating in the air-cylinder, a rod secured to said piston-head and passing through the aperture in the cap, a coil-spring arranged between the piston-head and cap, said spring being compressed when the pressure of the atmosphere is increased, said atmospheric pressure being measured by the piston-rod and graduated scale, substantially as shown and described.

602,243. BROOM-HOLDER. LOUIS RYBOLD, New York, N. Y. Filed July 10, 1897. Serial No. 644,129. (No model.)

Claim.—1. A holder for brooms, brushes and other articles, consisting of a plate which is provided with two curved spring-arms extended outwardly, and the ends of which are curved inwardly, said plate being also provided above and below said spring-arms with outwardly-directed plates against which the handle of the broom or brush is adapted to be pressed by the inwardly-curved ends of said spring-arms, substantially as shown and described.

2. A holder for brooms, brushes and other articles, consisting of a plate which is provided with two curved spring-arms extended outwardly, and the ends of which are curved inwardly, said plate being also provided above and below said spring-arms with outwardly-directed plates against which the handle of the broom or brush is adapted to be pressed by the inwardly-curved ends of said spring-arms, said plates being concaved at their outer edges, substantially as shown and described.

3. A holder for brooms, brushes and other articles, consisting of a plate which is provided with two curved spring-arms extended outwardly, and the ends of which are curved inwardly, said plate being also provided above and below said spring-arms with outwardly-directed plates against which the handle of the broom or brush is adapted to be pressed by the inwardly-curved ends of said spring-arms, said plates being concaved at their outer edges, and being also provided with serrations or teeth, substantially as shown and described.

602,244. WATER-TOWER. HERMAN C. SCHMIDT, New York, N. Y. Filed Apr. 16, 1897. Serial No. 632,394. (No model.)

Claim.—1. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in contact with said main standard and its foot in sliding connection with said base-frame, intermediate link connections between the tower-brace and the base-frame, a cable for hoisting said tower-brace and a cable for lowering the same, substantially as described.

2. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in sliding contact with said main standard and its foot in sliding connection with said base-frame, intermediate link connections between the tower-brace and the base-frame, a cable for hoisting said tower-brace and a cable for lowering the same, substantially as described.

3. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in contact with said main standard and its foot in sliding connection with said base-frame, intermediate link connections between the tower brace and the base-frame, a windlass-shaft provided with a hoisting-drum and a lowering-drum, a cable for hoisting said tower-brace and cable for lowering the same, substantially as described.

4. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in contact with said main standard and its foot in sliding connection with said base-frame, intermediate link connections between the tower-brace and the base-frame, a windlass-shaft provided with a pair of conical, spirally-grooved hoisting-drums, and a similar lowering-drum with relatively-reversed groove, a cable for hoisting said tower-brace and a cable for lowering the same, substantially as described.

5. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in contact with said main standard and its foot in sliding connection with said base-frame, intermediate link connections between the tower-brace and the base-frame, a cable for hoisting said tower-brace and a cable for lowering the same, both of said cables operating upon the foot of the tower-brace, substantially as described.

6. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in contact with said main standard and its foot in sliding connection with said base-frame, intermediate link connections between the tower-brace and the base-frame, a windlass-shaft provided with a pair of conical spirally-grooved hoisting-drums, and a similar lowering-drum with relatively-reversed groove, a cable for hoisting said tower-brace and a cable for lowering the same, both of said cables operating upon the foot of the tower-brace, substantially as described.

7. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in sliding contact with said main standard and its foot in sliding connection with said base-frame, a cable for hoisting said tower-brace and a cable for lowering the same, substantially as described.

8. In a water-tower, the combination of a base-frame provided with slotted tracks, a main standard pivoted therein, a tower-brace having its top in sliding contact with said main standard and its foot mounted upon a transverse shaft, provided with antifriction-rollers traveling in the slotted tracks of said base-frame and held thereby in sliding connection with said base-frame, a cable for hoisting said tower-brace and a cable for lowering the same, substantially as described.

9. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in contact with said main standard and its foot in sliding connection with said base-frame, hoisting-cable sheaves traveling with the foot of said tower-brace, a lowering-cable, a windlass-shaft provided with two hoisting-drums and a lowering-drum, a hoisting-cable traveling over said hoisting-cable sheaves and having one end attached to each of said hoisting-drums, and a lowering-cable traveling over said lowering-cable sheaves and having one end attached to said lowering-drum, substantially as described.

10. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in contact with said main standard and its foot in sliding contact with said base-frame, hoisting-cable sheaves traveling with the foot of said tower-brace, intermediate hoisting-cable sheaves, a lowering-cable sheave attached to said base-frame, an intermediate lowering-cable sheave, a windlass-shaft provided with two hoisting-drums and a lowering-drum, a hoisting-cable traveling over said hoisting-cable sheaves and having one end attached to each of said hoisting-drums, and a lowering-cable traveling over said lowering-cable sheaves and having one end attached to said lowering-drum, substantially as described.

11. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in sliding contact with said main standard and its foot in sliding connection with said base-frame, a detent to lock the top of said tower-brace to said main standard, and a detent to lock the foot of said tower-brace to said base-frame, said detents operating when the main standard has been brought into an elevated position, substantially as described.

12. In a water-tower, the combination of a base-frame, a main standard pivoted therein, a tower-brace having its top in contact with said main standard and its foot in sliding connection with said base-frame, and a detent to lock the foot of said tower-brace to said base-frame, said detent operating when the main standard has been brought into an elevated position, substantially as described.

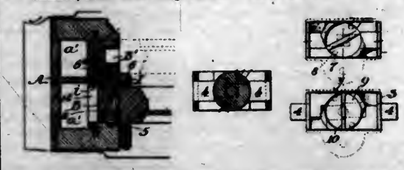
13. The combination, with the tower raising and lowering mechanism of a water-tower, of a windlass-shaft provided with both a hoisting-cable drum and a lowering-cable drum, a hoisting-cable sheave and lowering-cable sheave carried upon a common shaft, a hoisting-cable winding upon said hoisting-cable drum and traveling over said hoisting-cable sheave, and a lowering-cable winding reversely upon said lowering-cable drum and traveling over said lowering-cable sheave, whereby reverse movements are communicated to said common shaft by reversing the revolutions of said windlass-shaft, substantially as described.

14. The combination, with the tower raising and lowering mechanism of a water-tower, of a windlass-shaft provided with both a hoisting-cable drum and a lowering-cable drum, a hoisting-cable sheave and lowering-cable sheave carried loosely upon a common shaft, a hoisting-cable winding upon said hoisting-cable drum and traveling over said hoisting-cable sheave, and a lowering-cable winding reversely upon said lowering-cable drum and traveling over said lowering-cable sheave, whereby reverse lateral movements are communicated to said common shaft by reversing the revolutions of said windlass-shaft, substantially as described.

15. The combination, with the tower raising and lowering mechanism of a water-tower, of a windlass-shaft provided with both a hoisting-cable drum and a lowering-cable drum, a hoisting-cable sheave and lowering-cable sheave carried upon a common shaft, a hoisting-cable winding upon said hoisting-cable drum and traveling over said hoisting-cable sheave, and a lowering-cable winding reversely upon said lowering-cable drum and traveling over said lowering-cable sheave, whereby reverse movements are communicated to said common shaft by reversing the revolutions of said windlass-shaft, and an intermediate adjustable sheave for regulating the tension in said cables, substantially as described.

16. A water-tower adapted to be brought into an erect position, a cable for drawing the tower into such position, a cable for lowering the tower, an adjustable sheave over which the lowering-cable runs, said sheave being provided with a hollow, exterioriy-threaded shank within which one end of the lowering-cable is secured, and which shank is provided exteriorly with lock-nuts for adjusting said sheave and thereby regulating the tension in said cable, substantially as described.

17. A water-tower adapted to be brought into an erect position, a cable for drawing the tower into such position, a cable for lowering the tower, an adjustable sheave carrying said lowering-cable, said sheave being provided with a hollow, exteriorly-threaded shank within which one end of the lowering-cable is secured, a guide-block through which said shank extends, lock-nuts for adjusting said shank and thereby regulating the tension of said cable, and a windlass, provided with a plurality of conical, spirally-grooved drums, for operating said cables, substantially as described.



18. In a water-tower, the combination, with the running gears and frame of a truck, of a tower-supporting frame, a main standard having its base secured in said frame, and provided at its opposite end with slotted guideways, a tower-brace supported in said frame and in sliding connection therewith, its upper end engaging in the slotted guideways, aforesaid, and means for sliding out the foot of the brace and thereby erecting the standard, substantially as described.

19. The combination, in a water-tower, of a main standard, provided with a vertical fin and with a head-block carrying two hourglass guide-rollers, a discharge-pipe passing between said guide-rollers, a base-block, for supporting the end of said discharge-pipe sliding upon said standard and provided with a recess corresponding to said fin, a cable attached to said block and traveling over a sheave mounted upon said standard, and a windlass for operating said cable and thereby raising and lowering said pipe, substantially as described.

20. The combination, with the outlet of the discharge-pipe of a water-tower, of a section of hose extending to the nozzle, a pair of arms projecting beyond the end of said discharge-pipe, a pair of pivoted links extending from said arms to the base of the nozzle and pivoted thereto preventing lateral bending of the nozzle, a T-stop depending from the nozzle-base and its cross-bar engaging said links and hose, and a nozzle-line for depressing said nozzle, substantially as described.

21. In a water-tower, the combination with the running-gears and frame of a truck, of a supporting-table mounted thereupon, a base-frame provided with slotted tracks carried by said table, a main standard having its foot pivoted in said base-frame, a tower-brace, having its top in sliding contact with said main standard, and carried upon a transverse shaft provided with antifriction-rollers traveling in said slotted tracks of said base-frame, and also provided with two hoisting-cable sheaves and a centrally-disposed lowering-cable sheave, a pair of arms linking the tower-brace to said base-frame above said slotted tracks, a pair of intermediate hoisting-cable sheaves carried by said base-frame, a windlass-shaft provided with a conical, spirally-grooved drum upon each end, a cable passing around all of said hoisting-cable sheaves and having one of its ends secured to each of said drums, a third conical drum, with relatively-reversed spiral grooves, mounted centrally upon said windlass-shaft, an adjustable lowering-cable sheave mounted upon said base frame, a lowering-cable, having one end secured to said last-mentioned drum and the other end to the shank of said adjustable sheave, and passing around the said adjustable sheave, and said centrally-disposed lowering-cable sheave, substantially as described.

602,245. WINDOW STRUCTURE. THEODORE H. SCHMITZ, Philadelphia, Pa., assignor to the Philadelphia Safety Window Company, Camden, N. J. Filed Aug. 21, 1897. Serial No. 648,991. (No model.)

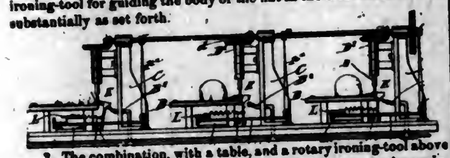
Claim.—1. In a window structure, the combination, with the main frame, the sash-hangers, the guides therefor, and the sashes journaled or pivoted to said hangers, of an adjustable parting-strip, an inside bead, a spring-hinge therefor, and a lock arranged between the bead and the parting-strip and adapted to lock said bead in closed position, substantially as described.

2. In a window structure, the combination, with the main frame, the sash-hangers, the guides therefor, and the sashes journaled or pivoted to said hangers, of an adjustable parting-strip, an inside bead, a spring-hinge therefor, a laterally-projecting keeper on said bead adapted to enter a recess in the window-frame, a lock arranged between the bead and the parting-strip and adapted to engage said keeper and thereby lock the bead in closed position, substantially as described.

3. In a window structure, the combination, with the main frame, the sash-hangers, the guides therefor, and the sashes journaled or pivoted to said hangers, of the movable bead, the adjustable parting-strip, and a lock arranged between said strip and bead and adapted to lock them in positions of adjustment, substantially as described.

4. In a window structure, the combination, with the main frame, the sash-hangers, the guides therefor, and the sashes journaled or pivoted to said hangers, of the movable bead, the adjustable parting strip, and a lock arranged between said strip and bead and provided with oppositely-movable bolts and with means for simultaneously operating them so as to engage and lock the said strip and bead in positions of adjustment, substantially as described.

5. The herein-described lock for windows, said lock comprising a frame or support, two oppositely-movable transverse bolts therein, a partially-rotatable head, and means whereby the head is loosely connected at diametrically opposite points with the respective bolts.



6. The herein-described lock for windows, said lock comprising a casing, a plate incased thereby, two transverse bolts in said plate, lateral studs on said bolts, a partially-rotatable head in said plate and casing provided with diametrically opposite recesses engaged by said studs respectively, and means for turning said head.

7. In a window structure, the combination of the main frame provided with the weight-box and the slotted or open pulley-stile, the grooved guide-strip having a hinged portion adjacent to the slot or opening in said stile, the sash-hanger, the sash journaled or pivoted thereon, the adjustable parting-strip, and the movable inside bead, substantially as described.

602,246. MACHINE FOR CURLING HAT-BRIMS. GUSTAV SCHLOEMBERG, Yonkers, N. Y. Filed Oct. 15, 1897. Serial No. 655,249. (No model.)

Claim.—1. The combination, with a table, and a rotary ironing-tool above said table, of a segmental curling-tool provided with a continuously-grooved face, the ingoing end of said curling-tool being approximately straight to a point adjacent to the ironing-tool and at a tangent to the outgoing end of the curling-tool, said outgoing end projecting inwardly over the table, substantially as set forth.

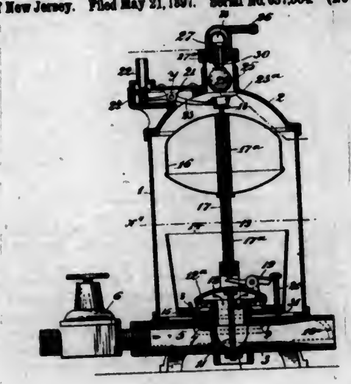
2. The combination, with a table, and a rotary ironing-tool above said table, of a segmental curling-tool provided with a grooved face and having its outgoing end projecting inwardly over the table, and a guide-roller on the table arranged at a suitable distance from the ironing-tool for guiding the body of the hat as the brim is fed around, substantially as set forth.

3. The combination, with a table, and a rotary ironing-tool above said table, of a segmental ironing-tool provided with a continuously-grooved face, the ingoing end of said curling-tool extending at a tangent to the outgoing end, which latter is curved inwardly over the table, substantially as set forth.

4. The combination, with a rotary ironing-tool, of a table, an elongated segmental curling-tool provided with a grooved face which is curved toward said ironing-tool, and a laterally-extending heel located back of the grooved face at a point intermediate of the projecting ends of the curling-tool, means for applying said curling-tool to the rotary ironing-tool, and means for heating the curling-tool below said heel, substantially as set forth.

5. The combination, with a rotary ironing-tool, of a table, a curling-tool provided with a grooved face, and an edge-guiding piece having a downwardly-projecting and interned hook, for guiding the edge of the hat-brims to the curling devices, substantially as set forth.

6. The combination with a rotary ironing-tool, of a table, a curling-tool provided with a grooved face, a guide-piece for the edge of the hat-brims provided with a raised or swelled center portion, and a curved hook at the inner end of the guide-piece adjacent to the ironing-tool and curling-tool, substantially as set forth.



7. A guide-piece for a hat-brim-curling machine, for operating on the edge of the hat-brims, said guide-piece being provided with a raised or swelled inwardly-tapering center portion, and a curved hook at the inner end of the guide-piece, substantially as set forth.

8. The combination with a table, of curling devices for the edge of the hat-brim, a guide-piece for bending and guiding the said edge in its motion to the curling devices, an adjustable arm mounted horizontally on the table, and a guide-roller carried by said arm at a suitable distance from the curling devices for guiding the body of the hat, while the brim is fed through the curling devices, substantially as set forth.

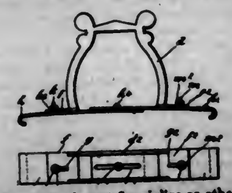
9. The combination with a table, of curling devices, means for feeding and guiding the hat-brim to the curling devices, and a pivoted moistening device adapted to moisten the edge of the brim of different sizes of hats preparatory to curling the same, substantially as set forth.

10. The combination, with a table, and a rotary ironing-tool over the table, of a normally-retracted curling-tool, a lever, a spring connection between the curling-tool and lever, a shoulder with which said lever is engaged for holding the curling-tool against the ironing-tool, and a stop mechanism provided with a cam engaging under and releasing said actuating-lever from said shoulder so as to permit the return of the curling-tool into its normal position after a certain length of time, substantially as set forth.

602,247. HYDRAULIC AIR-COMPRESSOR. WILLIAM F. STARK, New York, N. Y., assignor to the Standard Pump and Filter Company, of New Jersey. Filed May 21, 1897. Serial No. 637,504. (No model.)

Claim.—1. A hydraulic air compressor of the character described having a water-inlet port opening into the compression-chamber at its bottom, a water-outlet port opening downward, and a submergeable cup-float having its bottom between said ports and adapted to close the water-outlet port when buoyed up by the water, and to seat itself directly on and close the water-inlet port when it sinks by gravity, said cup-float having sufficient weight when submerged to prevent the influx of water and being guided in its up-and-down movements, substantially as set forth.

2. In a hydraulic air-compressor of the character described, the combination with the base, having in it a main liquid-inlet communicating with liquid-inlet ports 8, opening into the compression-chamber from the bottom, and a main outlet for the liquid, of the shell 12, having an outlet-port 12^a, communicating with the main liquid-outlet through the upright stem of said shell, and a cup-float 14, adapted to move up and down on the stem of the shell 12, and to close the outlet-port 12^a when buoyed up, and to seat on and close the inlet-ports 8 when it sinks to the bottom of the compression-chamber, substantially as set forth.



3. In a hydraulic air-compressor of the character described, the combination with the fixed, upright stem 13, forming a guide for the rod 17, the said rod, having a head 18, the valve controlling the air-inlet, and the lever 23, carrying said valve and having its arm arranged over the head 18, of a lever 19, fulcrumed on a fixed part, one arm of which takes under the rod 17, the cup-float having a projection which takes over the other arm of the lever 19, and the upper float 16, guided on the stem 13 and adapted to take under the head 18, when the float rises, whereby the air-inlet is opened by the rise of the upper float and kept open by the descent of the cup-float, substantially as set forth.

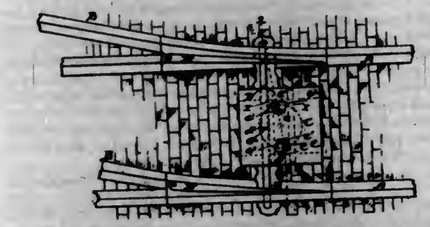
4. In a hydraulic air-compressor of the character described, the combination with the head or cover of the compression-chamber, and the removable plate 21, having in it the air-inlet 22, of the valve-lever 23, fulcrumed on said plate 21, and the valve 24 mounted on one arm of said lever, the other arm of the lever being weighted to keep said valve up to its seat whereby ready access to said valve and lever is provided, substantially as set forth.

5. In a hydraulic air-compressor of the character described, the combination with the upright, fixed stem 13, the float 16, guided thereon, the rod 17, guided non-rotatively on said stem and having a screw-adjustable head, 18, adapted to take over a part of the float, of the valve controlling the air-inlet, and the lever 23, carrying said valve, said lever having an apertured head 23^a, which takes over the nicked head 18, and said head 23^a being arranged directly beneath the air-outlet, whereby the head 18 may be conveniently adjusted on its stem.

6. In a hydraulic air-compressor, the combination with the casing containing the compression-chamber, having a cover or head 2 and a base 3, having a main inlet 5, a chamber 7, ports 8, for the admission of water to the compression-chamber, and a main outlet 10, of the shell 12, having a hollow stem, fixed in the base, and an annular outlet-port 12^a, communicating with the outlet 10, the cup-float 14, having an aperture in its bottom embracing the stem of the shell 12, and adapted to move up and down thereon to seat on and close, respectively, the outlet and inlet for the water, an inlet for the air, a valve and lever controlling said air-inlet, a float adapted, when buoyed up, to open said valve, and means, controlled and operated by the cup-float whereby, on the descent of the latter, the air-inlet valve is kept open, substantially as set forth.

602,248. ATTACHMENT FOR MUSICAL INSTRUMENTS. MARY E. VERDIER, Easton, Pa. Filed Sept. 24, 1897. Serial No. 652,570. (No model.)

Claim.—1. In an attachment for violins or other similar instruments, two vertically-extended parallel guide-plates unconnected at the top and passing over the strings, sliding plates rigidly attached to the bottom of the same, means substantially as described for attaching the same to a violin or other instrument and means whereby said first-mentioned plates may be properly adjusted with relation to the strings, substantially as described.



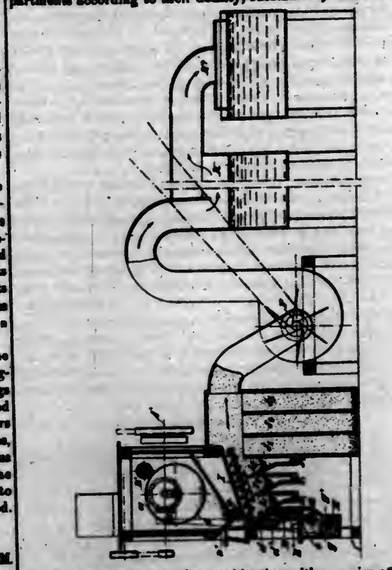
2. In an attachment for violins or other similar instruments, the combination with two vertical parallel guide-plates, and plates supporting the same, of laterally-movable plates adapted to be attached to the belly of the violin, and means in conjunction with said supporting and said adjusting plates, whereby said guide-plates may be properly adjusted in relation to the strings, substantially as shown and described.

3. In an attachment for violins or other similar instruments, the combination with two vertical parallel guide-plates, and supporting-plates therefor, said supporting-plates having elongated openings therein, of attaching-plates, said attaching-plates being provided respectively with an elongated opening, and a pivot, and screws adapted to cooperate with the openings in said supporting-plates, and nuts adapted in conjunction with said screws to retain the various parts in proper relation, substantially as shown and described.

4. In an attachment for violins or other similar instruments, the combination with two vertical parallel guide-plates, and supporting-plates therefor, said supporting-plates having elongated openings therein, of attaching plates, said attaching-plates being provided respectively with an elongated opening, and a pivot, and screws adapted to cooperate with the openings in said supporting-plates, and nuts adapted in conjunction with said screws to retain the various parts in proper relation, said attaching-plates being so turned at the edges as to clasp the rim of the belly of the violin, substantially as shown and described.

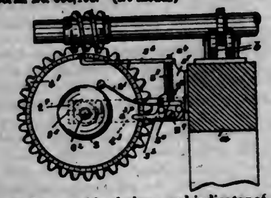
5. In an attachment for violins or other similar instruments, the combination with two vertical parallel guide-plates, and supporting-plates therefor, said supporting-plates having elongated openings therein, of attaching-plates, said attaching-plates being provided respectively with an elongated opening, and a pivot, and screws adapted to cooperate with the openings in said supporting-plates, and nuts adapted in conjunction with said screws to retain the various parts in proper relation, said attaching-plates being so turned at the edges as to clasp the rim of the belly of the violin, and padded to prevent mutilation of the same, substantially as shown and described.

602,249. RAILWAY-SWITCH-OPERATING MECHANISM. JONATHAN R. YOUNG and GEORGE HOLDEN, Conneaut, Ohio. Filed June 5, 1897. Serial No. 639,497. (No model.)



Claim.—In switch-operating mechanism, the combination of a switch-tongue, a bar D pivotally connected with said tongue and arranged below the same and moving endwise transversely of the track, a disk movable on a vertical axis, a pivotal connection between said disk and bar, springs acting to force said disk up, a cover-plate *c* having slots, and tripping-pins secured to said disk and projecting through said slots, substantially as and for the purpose specified.

602,250. ORE-SORTER. JACQUES ABEEL, Paris, France. Filed Sept. 30, 1897. Serial No. 653,569. (No model.) Patented in France Mar. 11, 1897, No. 264,878.



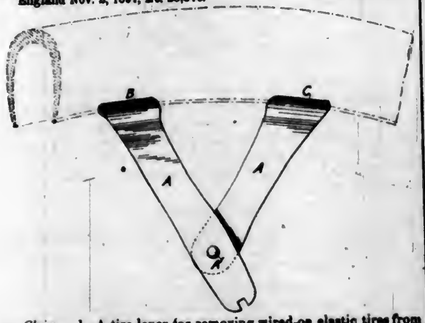
Claim.—1. The combination, with means for separating ore according to its size, of means for separating the same according to its density, comprising a series of chutes for receiving the ore particles which have been separated according to their sizes, a vertical screw conveyer turning in suitable bearings, one of said conveyers for each of said chutes, valves for controlling the supply of ore particles from said chutes to said conveyers, a vented chamber below the said chutes and the screw conveyers, a conveyer arranged in said chamber, means for turning said last-named conveyer, compartments behind said vertical conveyer, and a suction-fan producing a current whereby said vertical screw conveyers are caused to revolve and whereby the particles of ore are deposited into said compartments according to their density, substantially as set forth.

2. The combination of a series of chutes for receiving the particles of ore, a second series of chutes below the latter, valves controlling the openings between the first and second series of chutes, a series of upright screw conveyers arranged in said second series of chutes, a series of screw conveyers arranged above and at an angle to said upright screw conveyers, compartments arranged under the said angularly-arranged screw conveyers, and means for producing a current of air by which the said screw conveyers are all caused to revolve and whereby the particles of ore are deposited into said compartments according to their density, substantially as set forth.

3. In an ore-sorter, the combination with a series of compartments, and means for feeding ore particles to said compartments, of a screw conveyer arranged transversely over said compartments, said conveyer turning freely in suitable bearings, and an air-suction device producing a current whereby said conveyer is caused to turn, and the particles of ore deposited in said compartments according to density, substantially as set forth.

602,251. INDICATOR FOR WINDING, WARPING, AND BEAMING MACHINES. ROBERT ATHERTON, Paterson, N. J. Filed Nov. 30, 1897. Serial No. 660,198. (No model.)

Claim.—1. In a combined alarm and indicator of the character described, the combination with the graduated gear-wheel and its operating means, of a stub-shaft on which said gear-wheel is slidingly and revolubly mounted, a bracket carrying said stub-shaft, a hand-lever fulcrumed on said bracket, an annularly-grooved collar secured on the gear-wheel and surrounding the stub-shaft and also slidingly arranged thereon, an arm or link pivotally connected at one end with said fulcrumed hand-lever and engaging with its other fork-shaped end the said annularly-grooved collar, and a spiral spring connecting said link with the hand-lever for normally holding the gear-wheel in engagement with its operating means, substantially as described.



2. In a combined alarm and indicator of the character described, the combination with the graduated gear-wheel and its operating means, of a stub-shaft on which said gear-wheel is slidingly and revolubly mounted, a bracket carrying said stub-shaft, a hand-lever fulcrumed on said bracket, an annularly-grooved collar secured on the gear-wheel and surrounding the stub-shaft and also slidingly arranged thereon, an arm or link pivotally connected at one end with said fulcrumed hand-lever and engaging with its other fork-shaped end the said annularly-grooved collar, a spiral spring connecting said link with the hand-lever for normally holding the gear-wheel in engagement with its operating means, and means for normally holding the fork-shaped end of the link or arm in engagement with the annularly-grooved collar, substantially as and for the purposes described.

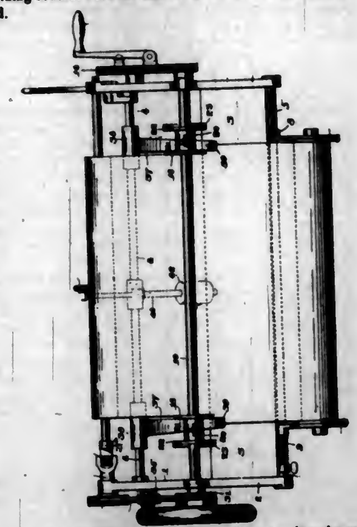
3. In a combined alarm and indicator of the character described, the combination with the graduated gear-wheel and its operating

means, of a stub-shaft on which said gear-wheel is slidingly and revolubly mounted, a bracket carrying said stub-shaft, a hand-lever fulcrumed on said bracket, an annularly-grooved collar secured on the gear-wheel and surrounding the stub-shaft and also slidingly arranged thereon, an arm or link pivotally connected at one end with said fulcrumed hand-lever and engaging with its other fork-shaped end the said annularly-grooved collar, a spiral spring connecting said link with the hand-lever for normally holding the gear-wheel in engagement with its operating means, and a hook-shaped pin carried by the bracket and engaging said link or arm for normally holding the fork-shaped portion of the latter in engagement with the said annularly-grooved collar, substantially as described.

4. The combination with a frame, of a stub-shaft carried thereby, a gear-wheel slidingly and revolubly mounted on said stub-shaft and provided with an annularly-grooved centrally-arranged collar, a pin projecting from said gear-wheel, a fulcrumed lever in the path of said pin, a spring-controlled shoe in alinement with and adapted to be operated by said fulcrumed lever and carrying a gong-hammer, a gong on the stub-shaft, a revolving shaft for operating said gear-wheel, a hand-lever fulcrumed in the frame, a link pivotally connected at one end with said hand-lever and having its other fork-shaped end in engagement with the said annularly-grooved collar, and a spiral spring connecting said hand-lever with said link for normally holding the gear-wheel in engagement with the revolving shaft and the pin in the path of the shoe-operating fulcrumed lever, substantially as described.

602,252. TIRE-LEVER. HENRY BEACH, London, England. Filed Dec. 15, 1897. Serial No. 661,980. (No model.) Patented in England Nov. 2, 1897, No. 25,370.

Claim.—1. A tire-lever for removing wired-on elastic tires from wheel-rims, composed of two arms, a joint pin connecting the arms near the ends thereof, to allow the arms to diverge at their free ends, and hook-shaped parts formed at the free ends of the arms adapted to be inserted beneath the wire of the tire to lift same at two points simultaneously over the rim edge, and to allow the operator to seize the wire extending between the two hook parts.



2. In tire-levers, the combination with the two arms, and a joint-pin connecting the arms near the ends thereof, of hook-shaped parts at the free ends of the arms at proper relative angles to coincide with the curvature of the wire as set forth.

602,253. MACHINE FOR TRIMMING WALL-PAPER. JAMES M. BRADY, Philadelphia, Pa. Filed Dec. 12, 1896. Serial No. 615,429. (No model.)

Claim.—1. In a machine for trimming wall-paper, &c., the combination with the supporting-frame, of parallel cutter-bearing shafts, a longitudinally-adjustable rotary cutter on one of said shafts, a similarly-adjustable coacting cutter on the other shaft, a spring to maintain said cutters in contact, and means whereby an adjustment of one of said cutters upon and throughout its shaft in either direction, causes a corresponding adjustment of the other cutter without affecting the pressure or tension of the spring, substantially as specified.

2. In a machine for trimming wall-paper, &c., the combination with the supporting-frame, of the parallel cutter-bearing shafts and the coacting rotary cutting devices carried by the said shafts and consisting each of a sleeve mounted to move longitudinally upon its shaft and having at one end a cutter-disk and at the opposite end a flange, the disk and flange of one of the devices lying between and engaging respectively the disk and flange of the other device, together with means whereby one of said devices may be secured against movement on its shaft, substantially as specified.

3. In a machine for trimming wall-paper, &c., the combination with the parallel cutter-bearing shafts, of the sleeve 20 adjustably secured upon one of the said shafts and having at one end a cutting-disk and at the opposite end a flange, the sleeve 24 movably mounted upon the other shaft and having at one end a flange which engages the outer face of the flange of the sleeve 20, and having also a cutter-disk 19 loosely mounted thereon, and springs for holding said disk in yielding contact with the disk of the sleeve 20, substantially as specified.

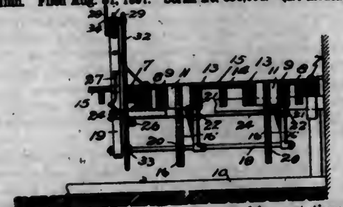
4. In a machine for trimming wall-paper, &c., the combination of the frame, the parallel cutter-bearing shafts, their coacting cutting devices, the take-up shaft, mechanism for actuating said shafts, and strip-guides supported at points in rear of and below the cutting devices, and extending upwardly and forwardly to or adjacent to the outer faces of the cutters, in planes above the meeting edges of the cutters and to points in front of them and above the platform or feed-board, whereby the under sides of said guides lie in position to intercept the trimmings and bend and direct the same downward in rear of the cutting devices, substantially as specified.

5. In a machine for trimming wall-paper, &c., the combination of the frame, the parallel cutter-bearing shafts, their coacting adjustable cutting devices, the jointed take-up shaft, means for insuring a uniform winding of the trimmed paper upon said shaft, and the longitudinally-adjustable strip-guides mounted upon the frame at points to the rear of and below the cutter-bearing shafts and extending from thence upwardly and forwardly between the cutting devices and terminating in upwardly-turned end portions, substantially as specified.

6. In a machine for trimming wall-paper, &c., the combination with the frame, of parallel cutter-bearing shafts, their coacting adjustable cutting devices, the take-up shaft, and means for operating the said shafts, a bar or tie-rod arranged between and below the said shafts, longitudinally-adjustable strip-guides on said bar or rod and extending upwardly and forwardly therefrom to or adjacent to the outer faces of the cutting devices in planes above the meeting edges of the cutters and to points in front of said cutters and above the platform or feed-board, whereby the under sides of said guides lie in position to intercept the trimmings and bend and direct the same downward between the lower cutter-shaft and said bar or rod, substantially as specified.

7. In a machine for trimming wall-paper, &c the combination with the supporting-frame, the parallel cutter-bearing shafts, their cutters, the take-up shaft and means for actuating said shafts of a lever whereof one arm carries a weight and the other a roller having a V-shaped periphery, which bears against the paper, during the winding thereof, substantially as specified.

602,254. SPINDLE. JOSEPH DUFFY, Paterson, N. J. Filed Nov. 12, 1897. Serial No. 658,236. (No model.)



Claim.—1. The combination with the driving means and with the rail provided with a vertical hole, of a bolt penetrating said rail and adjacent to said hole, a shell or chamber loosely mounted on the bolt, a bolster penetrating said shell or chamber and carried thereby and extending into and through the hole in the rail, a washer removably arranged in said hole and carried by the rail and penetrated by the bolster, a spiral spring surrounding said bolster and bearing against said washer and the inner upper portion of the shell or chamber respectively, a sleeve-whirl spindle in the bolster, and means for normally holding said sleeve-whirl spindle in frictional contact with the driving means, substantially as and for the purposes described.

2. The combination with the driving means and with the spindle-rail provided with a vertical hole, of a bolt penetrating said rail and adjacent to said hole and bearing with its nut against the under side of the rail, a collar at or near the upper portion of said bolt, a bolster penetrating the hole in the rail, an annular shell or chamber surrounding said bolster, a lug projecting from said shell or chamber and loosely mounted on the bolt and adapted to bear against the under side of the collar thereon, a washer removably arranged in said hole and penetrated by the bolster, a spiral spring surrounding said bolster and bearing against said washer and the inner upper portion of the shell or chamber respectively, a sleeve-whirl spindle in the bolster, and means for normally holding said sleeve-whirl spindle in frictional contact with the driving means, substantially as and for the purposes described.

3. The combination with the driving means and with the spindle-rail provided with a vertical hole, of a bolt penetrating the rail and adjacent to said hole and provided at its upper portion with a projection, a shell or chamber loosely mounted on said bolt, a bolster penetrating said shell or chamber and carried thereby and extending into and through the hole in the rail, a spiral spring surrounding the bolster and within said shell or chamber, a spindle in said bolster, a sleeve-whirl mounted on said spindle and provided with an annular flange adapted to be engaged by the projection on the bolt, and a spring carried by the rail and adapted to normally hold said sleeve-whirl spindle in frictional contact with the driving means, substantially as and for the purposes described.

4. The combination with the driving means and with the spindle-rail provided at certain intervals with vertical holes, a bolt penetrating said rail and adjacent to its respective hole, a shell or chamber above each hole and loosely mounted on its respective bolt, a bolster carried by each shell or chamber, a sleeve-whirl spindle in each bolster, a spiral spring within each shell or chamber and surrounding its respective bolster, a bracket between adjoining holes and projecting from the spindle-rail, a set-screw adjustably arranged in said bracket, and a flat spring centrally engaged by said set-screw and bearing with its free ends against the shells or chambers of adjoining spindles, substantially as and for the purposes described.

602,255. DUMPING-PLATFORM. SCOTT F. EVANS, Minneapolis, Minn. Filed Aug. 31, 1897. Serial No. 650,091. (No model.)

Claim.—1. A dumping-platform, comprising a stationary part, a movable part pivotally supported thereby, mechanism for tilting said movable part, arms or stops to engage said movable part and lock the same in a horizontal position, said arms or stops being transversely movable with respect to said movable part, and means for disengaging said arms or stops from said movable part, substantially as described.

2. In a dumping-platform, the combination, with the tilting portion of the platform, of means for tilting the same and returning it to its normal position, arms or stops arranged to engage said tilting portion and transversely movable with respect to the same, means connected with said arms for disengaging the same from said tilting portion, and means for automatically returning said arms or stops to their normal position, substantially as described.

3. In a dumping-platform, the combination with the stationary platform, of the tilting track-timbers supported thereby, means for operating the same, the pivoted arms or stops arranged to engage said track-timbers, and lock the same in a horizontal position, said arms or stops being movable transversely with respect to said timbers, means for disengaging said arms or stops from said timbers, and means for automatically returning said arms or stops to their normal position after the operation of dumping is completed, substantially as described.

4. The combination, in a dumping-platform, with the stationary portion, of the pivoted track-timbers supported thereby, means for tilting the same, the brackets secured beneath said stationary portion, the pivoted stops carried thereby and normally in engagement with said track-timbers, means for disengaging said stops from said track-timbers, and means for automatically returning the same to their normal position, substantially as described.

5. The combination, with the stationary platform, of the pivoted track-timbers and means for tilting the same, the brackets arranged beneath said platform, the pivoted stops carried thereby and normally in engagement with said track-timbers, a rod connecting said stops, a standard, a weighted lever pivotally connected to said rod and said standard, and means carried by said standard for operating said lever, for the purpose set forth.

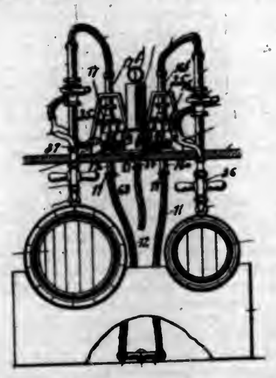
6. The combination, with a tilting platform and means supporting the same, of means for tilting said platform and returning it to its normal position, and means operating laterally with respect to said platform for locking it in a horizontal position and permitting it to tilt when unlocked, substantially as described.

7. The combination, with a tilting platform and means supporting the same, of means for tilting said platform and returning it to its normal position, and pivoted stops transversely movable with respect to said platform for locking it in a horizontal position and permitting it to tilt when unlocked, substantially as described.

8. The combination, with the platform, of the tilting track-timbers, the mechanism for tilting the same, the brake-wheel provided in connection with said mechanism, the strap or band passing over the same, the head or block supporting said brake-wheel and the screw carried by said head and passing through openings provided in the ends of said strap or band, substantially as described.

9. In a device of the class described, the combination with the upright standard, of the head or block carried thereby, the shaft mounted in bearings in said head, the brake wheel arranged upon said shaft, the bracket 36, the screw 37, the strap or band passing over said brake-wheel, said strap having one end attached to said screw and its opposite end provided with a block having a threaded opening to receive the same, and the collar 41 provided upon said screw, substantially as described.

10. The combination, with a tilting platform and means supporting the same, of means for tilting said platform and returning it to its normal position, brackets or hangers supported beneath said platform, pivoted stops carried thereby normally in engagement with said platform to lock the same in a horizontal position, means for simultaneously disengaging said stops from said platform and means for automatically returning said stops to their normal position, substantially as described.



11. The combination, with a tilting platform and means supporting the same, of means for tilting said platform and returning it to its normal position, pivoted stops operating laterally with respect to said platform for locking the same in a horizontal position, means for disengaging said stops to permit the tilting of said platform, and means for automatically returning said stops to their normal position, substantially as described.

12. The combination, with a stationary platform, of the pivoted track timbers, and means for tilting the same, the hangers or brackets arranged beneath said platform, the pivoted stops carried thereby and normally in engagement with said track-timbers, means connecting said stops to simultaneously disengage the same from said timbers, and means for returning said stops to their normal position, substantially as described.

13. The combination, with a stationary platform, of pivoted track-timbers and means for tilting the same, hangers or brackets, stops carried thereby and normally in engagement with said track-timbers, means for simultaneously disengaging said stops from said

timbers and means for automatically returning said stops to their normal position, substantially as described.

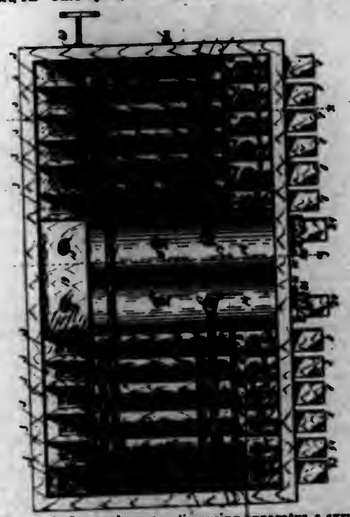
602,256. APPARATUS FOR RACKING BEER, ALE, OR OTHER LIQUORS. EDGAR FRIEDMAN, Dobbs Ferry, N. Y., assignor of one-fifth to Louis Baeppler, same place. Filed Sept. 14, 1897. Serial No. 651,600. (No model.)

Claim.—1. In an apparatus for racking beer, &c., the combination of a supply-pipe, two independent filling-tubes communicating with the supply-pipe, and a twin coupling between the independent filling-tubes and supply-pipe located below the level of and at considerable distance from the discharge ends of the filling-tubes, and thereby providing independent equalizing liquid columns in said filling-tubes, substantially as set forth.

2. In an apparatus for racking beer, &c., the combination of a supply-pipe, two independent fillers, a twin coupling attached to the supply-pipe, and independent vertically-extending tubes communicating between the branches of the twin coupling and the independent fillers; the twin coupling being located below the level of the discharge ends of the fillers, substantially as set forth.

3. In a beer-racking device, the combination of the settling-tank, and supply-pipe leading therefrom, a twin coupling in the supply-pipe, independent vertically-extending tubes leading from the branches of the twin coupling, independent fillers communicating with said vertically-extending tubes, and means for supporting the barrels or packages to be filled above the level of the twin coupling, substantially as and for the purpose set forth.

4. In a beer-racking device, the combination of a settling vat or tank, a supply-pipe leading therefrom, a twin coupling attached to said supply-pipe, independent vertically-extending branch tubes communicating with the branches of said twin coupling, suitably-supported independent observation-glasses in said vertically-extending tubes, a pair of independent fillers communicating with said tubes above the observation-glasses, means for supporting the fillers, and a barrel stand or rack adapted to support the barrels or packages to be filled above the level of the twin coupling-tubes, substantially as and for the purpose set forth.



5. In a racking apparatus, the combination of a liquor-supply, and two independent filling devices having overflow-passages in open communication with the packages when in operative position, with a back-pressure device comprising a pressure-chamber communicating with the overflow-passages of both filling devices, and a controlling-valve constructed and arranged to open up communication between the pressure-chamber and both overflow-passages of the filling devices in one position, and between one overflow-passage and pressure-chamber and the other overflow-passage and open air in another position, substantially as set forth.

6. In a racking apparatus, the combination of a liquor-supply, and two independent filling devices having overflow-passages in open communication with the packages when in operative position, with a back-pressure device comprising a pressure-chamber communicating with the overflow-passages of the filling devices, and a valve controlling said communication; said valve being constructed and arranged to be moved into three positions, one position of the valve opening up communication between both filler-overflow passages and pressure-chamber, the second position opening up communication between one overflow-passage and pressure chamber and other overflow-passage and open air, the third position reversing the arrangement of the overflow-passages with relation to the pressure-chamber and open air, substantially as set forth.

7. In a racking apparatus, the combination of a liquor-supply, and two independent filling devices having overflow-passages, with a back-pressure device comprising a pressure-chamber communicating with the overflow passages of the filling devices, a pressure-supply such as an air-pump, and a controlling-valve constructed and arranged to open up communication between the overflow-passages of the filling devices and pressure-chamber, the overflow-passages and the open air, and the pressure-supply and the pressure-chamber, substantially as set forth.

8. In a racking apparatus, the combination of a liquor-supply, and two independent filling devices having overflow-passages, with a back-pressure device comprising a pressure-chamber, a pressure-supply such as an air-pump, and a seven way valve controlling communication between the overflow-passages of the filling devices, with the pressure-chamber and the open air, and the pressure-supply with the pressure-chamber, substantially as set forth.

602,257. SODA-WATER APPARATUS. JOHN F. HAINES, Freeport, Pa. Filed Apr. 3, 1897. Serial No. 630,630. (No model.)

Claim.—1. In a soda-water-dispensing apparatus, a syrup-reservoir, a supply-pipe connecting said reservoir and a supply-can, means operating in connection with said can, whereby a given quantity of syrup is dispensed, a mixing-chamber, a gas-generating chamber, supply-pipe connecting said mixing-chamber and gas generating chamber, and means for dispensing the carbonated liquid, substantially as shown and described.

2. In a soda-water-dispensing apparatus, a mixing-chamber, a gas-reservoir, pipes connecting said chambers, and reservoir, a syrup-reservoir, a syrup-dispensing can, a cylinder communicating with said can, and provided with a discharge-pipe, a piston operating in said chamber, a rod engaging said piston, a bar connecting said rod, and an operating-rod, operating in a compartment, and treadle means for operating said piston, substantially as shown and described.

3. In a soda-water-dispensing apparatus, a syrup-reservoir, a syrup-dispensing can, pipe connections between said reservoir and can, a mixing-chamber, a rotary stirrer journaled in said chamber, and means for operating the same, in combination with a gas-reservoir, a gas-generating chamber located inside said reservoir, and a removable gas-generator, substantially as shown and described.

4. In a soda-water-dispensing fountain, a mixing-chamber, a rotary stirrer journaled in said chamber, a gas-reservoir, pipes connecting said chamber and reservoir, a gas-generating chamber, a gas-generator carried by said generating-chamber, consisting of a cylinder provided with a longitudinal opening in one side, a trough located in said opening, and means for discharging said carbonated liquid, substantially as shown and described.

5. In combination, a soda-water-dispensing apparatus, comprising a mixing-chamber, a rotary mixer journaled in said chamber, an auxiliary chamber communicating with said chamber, a gas-reservoir, a gas-generating chamber, a gas-generator located inside of said chamber, pipes connecting said gas-reservoir and mixing-chamber, and means for dispensing the carbonated beverage, substantially as shown and described.

602,258. TRUNDLE-HOOP. CARL HAUPT, Brooklyn, N. Y. Filed Oct. 30, 1897. Serial No. 656,902. (No model.)

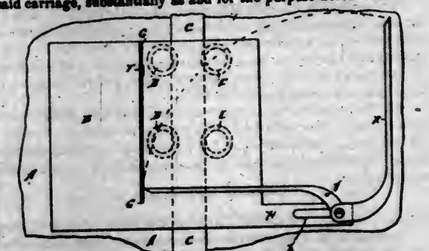
Claim.—1. A trundle-hoop, having eyes on the circumference of the same, said eyes being arranged in pairs at diametrically opposite sides thereof, and cross-strings secured to said eyes and crossing each other at right angles near the center of the hoop, substantially as set forth.

2. The combination, with a trundling-stick provided with a grooved end, of a trundle-hoop having eyes upon the circumference thereof, said eyes being arranged in pairs at diametrically opposite sides of said hoop, and cross-strings secured to said eyes and adapted to spring laterally and be overlapped at the center so as to hug the grooved end of the trundling-stick, substantially as set forth.

602,259. WAGON-JACK. CHARLES T. JAMES, Paterson, N. J. Filed July 12, 1897. Serial No. 644,169. (No model.)

Claim.—The combination with the lifting-bars of a wagon-jack of the character above described, said lifting-bars being provided with a series of vertical sockets, of a metallic strip on the top portion of each of said lifting-bars, and longitudinally arranged thereon, a series of springs between each metallic strip and its respective lifting-bar, and a series of pins carried by said metallic strips and slidingly arranged in the said vertical sockets of the lifting-bars, substantially as and for the purposes described.

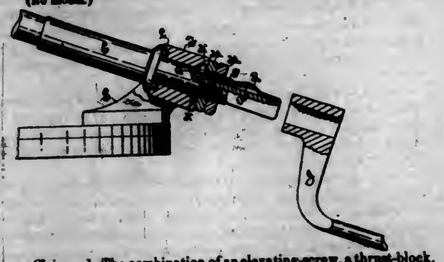
602,260. BOBBIN. HERBERT D. KLOTZ, Garden City, N. Y., assignor to the Pendleton Manufacturing Company, Carbondale, Pa. Filed Aug. 21, 1897. Serial No. 648,967. (No model.)



Claim.—1. A bobbin formed of a wooden core having fixed peripheral ribs, a short distance from each end, and metallic heads each formed of an inner and an outer piece of sheet metal bound together peripherally, the inner edge of the outer head-piece encircling the core and bearing axially against the outside of said rib, and the inner head-piece bent axially to form a sleeve surrounding the periphery of said rib and bent radially to encircle the core and bear axially against the inside of said rib.

2. A bobbin formed of a wooden core having fixed peripheral ribs, a short distance from each end, and metallic heads each formed of an inner and outer piece of sheet metal bound together peripherally, the inner edge of the outer head-piece bearing axially against the outside of said rib and the inner head-piece bent radially to encircle the core and bear against the inside of said rib, then bent axially to form a sleeve surrounding the periphery of said rib and then bent outward radially and inward axially to form an annular recess around said sleeve, and an outer barrel having its end seated in said recess and surrounding said sleeve.

602,261. SAW-TABLE GAGE. ANTHONY KOTT, Detroit, Mich. Filed Dec. 15, 1897. Serial No. 661,941. (No model.)



Claim.—1. The combination with a saw-table of a carriage, B, adapted to move upon said table, a guide adapted to constrain the motion of said carriage and arms, J K, adjustably secured to, and laterally beyond the work-supporting part of, said carriage, so that they may be adjusted to different positions over the work, said arms having their index ends extending approximately to the saw-line of said carriage, substantially as and for the purpose described.

2. The combination with a saw-table of a carriage, B, adapted to constrain the motion of said carriage, and arms, J K, pivoted laterally to, and beyond the work-supporting part of, said carriage, so that they may be swung over the work with index ends extending approximately to the saw-line of said carriage, substantially as shown and described.

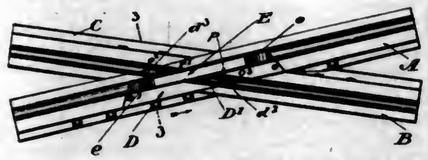
3. The combination with a saw-table of a carriage adapted to move upon said table, a guide adapted to constrain the motion of said carriage, and arms, J K, pivoted upon one axis, said axis being located upon said carriage laterally beyond the work-supporting part thereof, so that said arms may be swung over the work with index ends extending approximately to the saw-line of said carriage, and means for adjusting said axis toward and away from the work-supporting part of said carriage substantially as shown and described.

602,262. ELEVATING-SCREW FOR AERIAL LADDERS, &c. ASA W. LA FRANCE, Elmira, N. Y., assignor to the La France Fire Engine Company, same place. Filed Jan. 10, 1898. Serial No. 666,156. (No model.)

Claim.—1. The combination of an elevating-screw, a thrust-block, an operating-crank, and a lock whereby the screw is automatically locked from turning in the thrust-block when the crank is removed, substantially as described.

2. The combination of a screw, a thrust-block, a spring-dog attached to the screw-shank to engage a notch in the thrust-block, a projection on the spring-dog, and a crank provided with a socket adapted to depress the spring-dog when attached to the screw-shank, substantially as described.

602,263. AIR-LOCK FOR CAISSONS. SAMUEL MATTSON, Brooklyn, N. Y. Filed Sept. 11, 1897. Serial No. 651,284. (No model.)



Claim.—1. An air-lock for caissons having an upper opening of substantially oval form, and a correspondingly-shaped gate or cover centrally pivoted, whereby when it is turned on its pivot-bearing it can be projected through said opening, substantially as set forth.

2. An air-lock for caissons having the upper end of its casing bent to form an upper oval opening, a gate or cover also of oval shape but of greater corresponding diameter than said opening, said cover having a central opening, and a bucket having a rope which is passed through said opening, substantially as set forth.

3. An air-lock for caissons having an opening not of uniform diameter, a correspondingly-shaped gate or cover of slightly-increased diameter having a central opening, a spherical body fitted in said opening and having a central hole flared at one end, and a stuffing-box having a hole in line with said former hole, and also flared at its outer end, substantially as set forth.

4. The cover having an opening, a spherical body fitted in said opening, plates attached to said cover having concaved ends for holding said body, which latter has a hole flared at one end, and a stuffing-box in line with said hole having its outer end flared, substantially as set forth.

602,264. RAILWAY TRACK STRUCTURE. FRANK HATHER, Johnstown, Pa., assignor to the Johnson Company, Lorain, Ohio. Filed Dec. 11, 1897. Serial No. 661,580. (No model.)

Claim.—1. The combination of the continuous rail having a suitable length of its tread portion removed, the crossing-rails secured to the continuous rail, and a separate member also secured to the continuous rail and having a head occupying the place of said removed tread.

2. The combination of the continuous rail having a suitable length of its tread portion removed, the crossing-rails secured to the continuous rail, and a separate member parallelling the continuous rail and having a tread portion taking the place of said removed portion.

3. In a railway-crossing, the combination with the rails thereof, one of which has a suitable length of its tread portion removed, of a member having a web and head, the said head occupying the place of the said removed tread and the said web secured to the web of the same rail.

4. In a railway-crossing the combination with the rails thereof, one of which has a suitable length of its tread portion removed, of a member having a web and head, the said head occupying the place of the said removed tread and the said web parallelling and secured to the web of the same rail.

5. In a track structure the combination with a continuous rail having a suitable length of its tread portion removed, of a member parallelling, and secured to, said rail and having a head occupying the place of said removed tread, and a floor plate secured between the said member and the guard of the said rail.

6. The combination of the continuous rail having a suitable length of its tread-surface removed, the crossing-rails secured to the continuous rail, a separate member also secured to the continuous rail and having a head occupying the place of said removed tread, and a floor-plate lying between the said member and the guard of the continuous rail.

7. The combination of a rail having a suitable length of its tread portion removed, a member having a head taking the place of said removed portion, and a floor-plate dovetailed between the guard of the rail and the aforesaid member.

8. The combination of a continuous rail, having a suitable length of its head removed, a pair of crossing-rails, a member having a head and web, the former taking the place of said removed head, a bar dovetailed between the guard of the continuous rail and the head of the said member, and means for securing all the foregoing parts together.

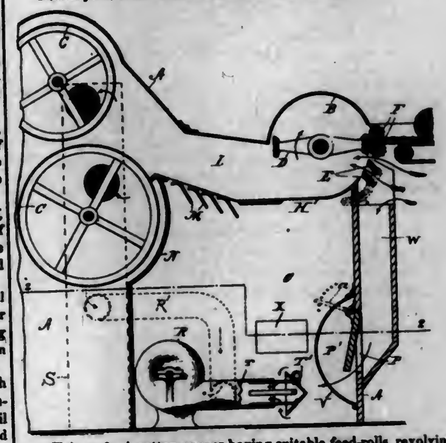
9. In a railway track structure the combination of the rails A, B and C, the member D having a groove in alinement with the grooves of rails B and C, the floor-plate E, and means for securing the whole together.

10. In a railway track structure, a member having a head portion occupying a space formed by the removal of a suitable length of one of the crossing-rails and having a groove across its head portion in alinement with the groove of the other of said crossing-rails.

11. In a railway track structure, a rail having a suitable length of its tread portion removed, in combination with crossing-rails secured thereto, and a member having a head portion taking the place of said removed tread, and an inclined groove across its head in alinement with the groove of the crossing-rails.

12. The combination with the recessed main rail, the crossing-rails secured thereto, the member fitting into the said recess, a groove in said member and in the main rail in alinement with the grooves of the crossing-rails, and a floor-plate in the groove of the main rail.

13. In a railway track structure, the combination with the recessed main rail, the crossing-rails secured thereto, the member fitting into the recess of the main rail, a groove in said member alining with the groove of the crossing-track and having an inclined floor, a similar groove with inclined floor in the guard of the main rail, and a floor-plate in the groove of the main rail.



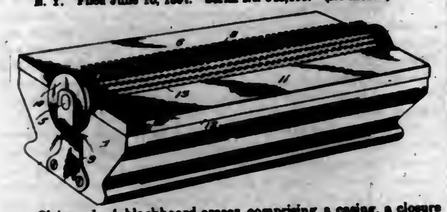
14. The combination of a continuous rail having a recess, a tread member inserted in said recess, crossing-rails abutting opposite sides of the tread member, and a groove in the tread member in alinement with that of the crossing-rails.

15. The combination of a continuous rail having a recess, a tread member inserted in said recess, crossing-rails abutting opposite sides of the tread member, a groove in the tread member in alinement with that of the crossing-rails, and a floor-plate lying beside the tread member and in the groove of the continuous rail.

16. The combination of a continuous guard rail having a recess, a tread member inserted in said recess, crossing-rails abutting opposite sides of the tread member, inclined grooves across the tread member, said grooves being in alinement with the grooves of the crossing-rails, and a floor-plate between the side of the tread member and the guard of the continuous rail.

17. In a railway track structure, the combination with the recessed main rail and the crossing-rails, of a member having a web and head, the web lying beside that of the main rail and the head fitting into the recess therein, splice-bars engaging the rails and the outside of said web, and bolts securing the whole together.

602,265. COTTON-OPENER. JOHN O'CONNELL, Chicopee, Mass. Filed Sept. 9, 1897. Serial No. 651,142. (No model.)

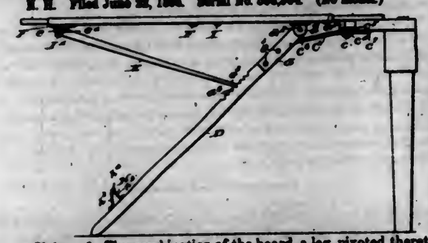


Claim.—1. A cotton-opener having suitable feed-rolls, revolving beater-arms, adjustable bars for receiving the impact of the cotton carried by the said beater-arms, means for revolving said arms, a screen near said bars, a compartment under said screen, suitable means for maintaining a partial vacuum in said compartment whereby a current of air is established through said bars into the machine and down through said screen into the said compartment, combined with means for increasing or diminishing said air-current, for the purpose described.

2. In a cotton-opener, suitable feed-rolls, beater-arms revolving in proximity to said rolls within a suitable case, exhaust-cylinders for receiving fiber from said beater-arm case, adjustable bars located in proximity to said feed-rolls, a compartment under said beater-arm case, a conduit or chute having one of its ends connected to the said compartment, and its opposite end lying near said adjustable bars, means for regulating the size of the opening between said conduit and said compartment, a screen between the said beater-case and said compartment, and means for creating a partial vacuum in the latter, substantially as set forth.

3. In a cotton-opener, suitable feed-rolls, adjustable bars located in proximity to said feed-rolls, beater-arms revolving in proximity to said rolls and bars, exhaust-cylinders for receiving cotton from said beater-arms, a suitable casing for said beater-arms and cylinders, a fan, a compartment under said beater-casing, a conduit extended between said compartment and said cylinders, and connected to said fan whereby air may be exhausted from both said cylinders and compartment, means for regulating the amount of air to be so exhausted, and a conduit connected by one of its ends with said compartment and having its opposite end lying near said bars, and means for opening and closing said conduit, substantially as described.

602,266. BLACKBOARD-CLEANER. LAURA A. PEIK, Geneva, N. Y. Filed June 10, 1897. Serial No. 640,190. (No model.)

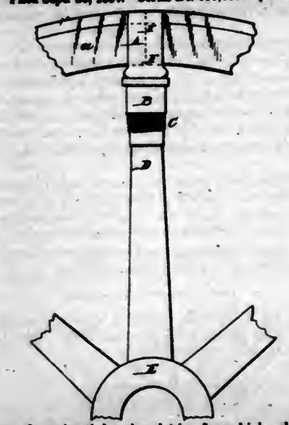


Claim.—1. A blackboard-eraser comprising a casing, a closure for an open side of said casing and provided with a longitudinal central slot, a rotatable roller journaled in the casing, the individual flexible tongues arranged in spiral series on the roller and protruding through the slot in said closure to present abrasive surfaces, and drive-wheels rigid with said roller and protruding beyond the closure to have frictional contact with a blackboard and to positively turn the roller, whereby the roller is rotated and the individual tongues thereof are caused to forcibly impinge against a blackboard-surface to efface chalk or crayon marks therefrom, as set forth.

2. In a blackboard-cleaner, the combination with a casing and rotatable roll journaled therein, of a flexible closure detachably secured to the open side of said casing and having a longitudinal slot through which said roll protrudes, substantially as and for the purposes described.

3. In a blackboard-cleaner, a casing, and a closure made in a continuous sheet of rubber, provided with a central longitudinal slot and arranged to be fastened detachably to the casing by springing the same over the edges thereof, combined with a roll arranged to have its working surface project through the slot in said casing, as and for the purposes described.

4. A blackboard-cleaner comprising a chambered casing having an open side, a flexible closure detachably applied to said open side of the casing and arranged to form a longitudinal slot or opening, and a roll journaled in said casing and provided with the plurality of individual flexible tongues and with the frictional driving wheels or disks, the protruding ends of said tongues forming broad erasive surfaces, substantially as described.



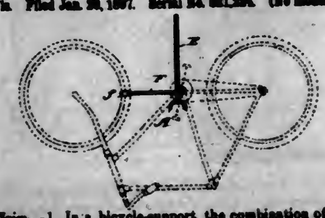
602,267. IRONING-BOARD. ROBERT A. PRESCOTT, Kingston, N. H. Filed June 22, 1897. Serial No. 640,904. (No model.)

Claim.—1. The combination of the board, a leg, pivoted thereto near one end of the same, a brace, hinged to said board near the other end of the same and having a free end adapted to rest upon said leg, to support said board, said brace being adapted to be folded against said board and said leg being adapted to be folded against said brace when not in use, a catch adapted to hold said leg in its folded position, and buffers of elastic material secured to said board and to said brace, respectively, to receive said brace and leg when folded.

2. The combination of the board, a leg, strips secured to opposite sides of an end of the same and extending beyond said end, ears, secured to the bottom of said board, said strips being pivoted to said ears, a spring-lever, supported on said board, between said ears and the adjacent end of said board, a pin passing through said strips above one end of said lever to depress said end of said lever and to raise the other end of said lever when said leg is turned downward, to clamp the edge of a table between said board and the last-named end of said lever, and a brace, to prevent the movement of said leg by said spring-lever, and to enable said board to be adjusted to tables of different heights.

602,268. SPOKE AND FELLY ADJUSTER. JASPER H. RACHESS, Judsonia, Ark., assignor to Moses Wedford and Mary M. Rachess, same place. Filed Sept. 25, 1897. Serial No. 653,062. (No model.)

Claim.—In a tire-tightening device for vehicle-wheels, the combination with the felly having a recess in its inner side, and the tire, of the U-shaped clip comprising the horizontal and vertical portions, the lug on the horizontal portion engaging with said recess, and said horizontal portion formed on its inner side with a cylindrical stud, the hollow rotatable nut formed with an opening with which said stud engages, the exteriorly-threaded thimble, tapered to form a sharp inner end and the spoke with which said thimble engages, substantially as described.



602,269. STOPPER FOR DISCHARGE OF AERATING CAPSULES. HARRY V. R. READ, London, England. Filed Feb. 26, 1897. Serial No. 626,092. (No model.)

Claim.—1. The combination with a bottle or vessel, having a screw-threaded neck, of a screw-threaded stopper arranged to engage the same, a sleeve arranged to hold a capsule and having a lip arranged to rest upon an inner shoulder of the bottle-neck, and a pin upon the stopper arranged to prick the capsule, substantially as described.

2. The combination with a bottle or vessel, of a stopper arranged to carry a capsule, and having a pin arranged to prick the same, and a check-valve arranged between the capsule and the interior of the bottle or vessel; substantially as described.

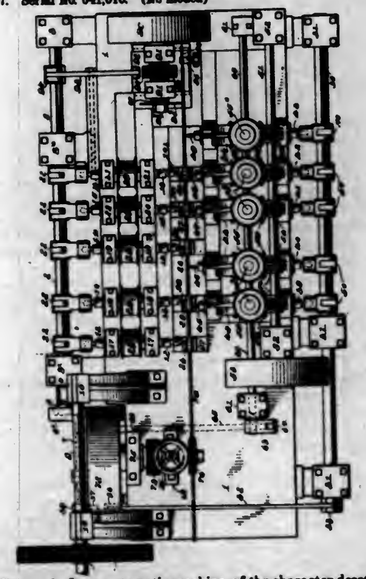
602,270. BICYCLE-SUPPORT. HOWARD T. SACKETT, Fond du Lac, Wis. Filed Jan. 20, 1897. Serial No. 621,294. (No model.)

Claim.—1. In a bicycle-support, the combination of a crescent-shaped hanger-saddle of trough-shaped cross-sectional form and having the oppositely-facing bearing-surfaces, and a carrying-arm attached centrally to the hanger-saddle, substantially as described, for the purposes set forth.

2. In a bicycle-support, the crescent-shaped hanger-saddle of

trough-shaped cross-sectional contour and provided with a centrally-arranged flat attaching-lug, combined with an overhanging arm which is fastened laterally to said attaching-lug and in central relation to the hanger-saddle, substantially as described, for the purposes set forth.

3. In a bicycle support or hanger, a bearing-block or saddle cast in a single piece of metal and curved continuously throughout its length to form at or near the terminals of said saddle or block the bearing-surfaces which face outwardly and in opposite directions, said saddle being trough-shaped in cross-section and adapted to clasp or embrace the frame-bars of a bicycle to restrain the latter from sidewise displacement, substantially as described, for the purposes set forth.



4. As a new article of manufacture, the bicycle-hanger comprising a single cast-metal saddle of trough-shaped cross-sectional contour and curved to present the oppositely-facing bearing-surfaces near the terminals thereof, and the cushion-blocks situated within said trough-shaped saddle and over the bearing-surfaces thereof, substantially as described, for the purposes set forth.

602,271. BOLT-CASE. HENRY B. SARGENT, New Haven, Conn., assignor to the Sargent & Company, same place. Filed Jan. 18, 1896. Serial No. 575,954. (No model.)

Claim.—A bolt-case made from a single piece of sheet metal, comprising longitudinally-arranged slack-providing flutes formed in the flat ends of the plate portion of the case, and located at the corners of the bolt-housing which is drawn from the central portion of the blank from which the plate is formed, the drawing of the said portion of the plate tending to form cracks in the metal at the point where the ends of the housing merge into the plate portion of the case, and the presence of the said slack-providing flutes relieving the strain upon the metal at such points and preventing the metal from cracking.

602,272. DRILLING AND TAPPING MACHINE FOR DOOR-KNOB SPINDLES. FRANKLIN B. SHUSTER, New Haven, Conn. Filed June 16, 1897. Serial No. 641,010. (No model.)

Claim.—1. In an automatic machine, of the character described, the combination with a series of drills and their operating mechanism adapted to operate on a rod fed along in front of such drills and against a fixed stop, combined with means for severing a finished section from the end of said rod, for the purpose set forth.

2. In an automatic machine for drilling door-knob spindles, or articles of like character, the combination of a series of drills and mechanism for operating them, feed-rolls adapted to feed a rod along through fixed supports or drill-jigs a distance represented by the length of the finished article, a fixed stop against which the end of such rod is brought each time it is moved forward, and means for cutting off a finished section therefrom, for the purpose set forth.

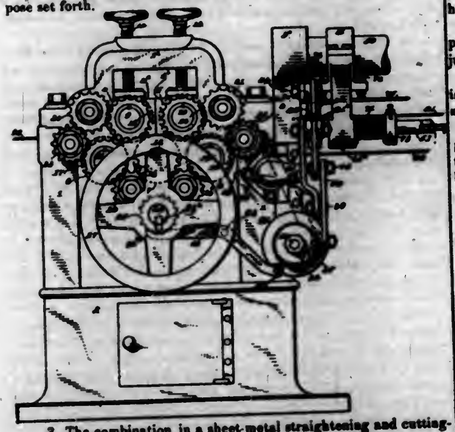
3. The combination, in an automatic machine, of the character described, of a series of drill-spindles and their operating mechanism, feed-rolls, drill-jigs, or other like supports for a rod to be acted upon, a fixed stop, and a cutting-off apparatus, for the purpose set forth.

4. The combination, in an automatic machine, of the character described, of a series of independently-operating drill-spindles and mechanism therefor, feed-rolls for feeding a rod along the series of drills a distance represented by the length of a section to be severed from said rod, a fixed stop against which the end of the said rod is brought at each forward feed and a cutting-off apparatus, for the purpose set forth.

5. The combination, in an automatic machine, of the character described, of a series of drill-spindles adapted to act on a rod fed forward thereto, operating mechanism therefor, a series of tapping-spindles adapted to operate on the opposite side of said rod, mechanism for operating said tapping-spindles, feed-rolls adapted to feed said rod the full length of a required section, a fixed stop for the end of said rod, and a cutting-off apparatus, for the purpose set forth.

6. The combination, in an automatic machine, of the character described, consisting of a series of drill-spindles and their operating mechanism, feed-rolls for feeding a rod by the end of said spindle, and their operating mechanism, a fixed stop against which said rod is fed, cutting-off apparatus and its operating mechanism, combined so that each time the rod is fed forward against the said stop a distance representing the section to be cut off, the rolls cease feeding, while the drills are operating; and after such drills have performed their work, they will be retreated and the cutting-off mechanism brought into operation, for the purpose set forth.

7. The combination, in an automatic drilling and tapping machine, of the character described, consisting of a series of drilling and tapping spindles, carrying taps and drills, and their operating mechanism, feeding mechanism for feeding a metal strip or rod between the series of said drilling and tapping spindles and against a fixed stop, cutting-off mechanism for severing a completed section from the end of such rod, for the purpose set forth.



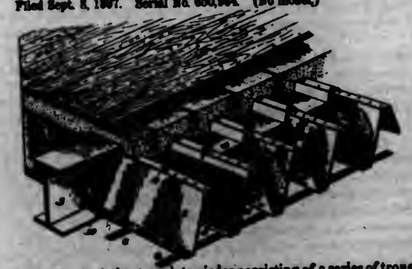
8. The combination, in an automatic drilling and tapping machine, for door-knob spindles and articles of like character, of a series of drilling and tapping spindles carrying the necessary drills and taps adapted to operate to and from the rod-feeding line, operating mechanism for said drilling and tapping spindles, feeding mechanism for feeding a rod between said drills and taps, said feeding mechanism adapted each time it engages the rod to feed said rod forward the full length of the finished article to be severed therefrom and against a fixed stop, cutting-off mechanism between said stop and the drilling and tapping mechanism, drill-jig supports substantially as shown, all combined so that, when the said rod has passed by the line of the series of drills and taps, all of said drills and taps will be operating at the same time, for the purpose set forth.

9. The combination, in an automatic drilling and tapping machine for door-knob spindles or articles of like character, consisting of a series of drilling and tapping spindles carrying drills and taps and adapted to operate to and from the feeding-line of a rod between such drills and taps, mechanism for operating such spindles, feeding device for feeding a rod to be drilled and tapped, drill-jigs or other like supports, a fixed stop against which the end of such rod is fed, and a cutting-off apparatus for severing a completed section therefrom, for the purpose set forth.

602,273. SHEET-METAL STRAIGHTENING AND CUTTING-OFF MACHINE. FRANKLIN B. SHUSTER, New Haven, Conn. Filed June 15, 1896. Renewed Sept. 18, 1897. Serial No. 652,177. (No model.)

Claim.—1. The combination, in a sheet-metal straightening and cutting-off machine, of the straightening-rolls, a support therefor, means, substantially as shown, for operating such rolls, cutting-off mechanism placed forward of such rolls, an overhead supporting-shaft secured in position, substantially as shown, supports depending from said shaft, side rods journaled in the free ends of said supports, table-arms rigidly secured to said shafts, a platform or table on such table-arms, means, substantially as shown, whereby said rods are rotated in their supports and the said table-arms opened and closed, for the purpose set forth.

2. The combination in a sheet-metal straightening and cutting-off machine, of the straightening-rolls and cutting-off mechanism, such cutting-off mechanism placed forward of such rolls, means whereby both sets of mechanism are automatically and independently operated, an overhead supporting-shaft, table-rod supports depending therefrom, table-rods journaled in said supports, a series of table-arms rigidly attached to said rods, a platform mounted on said arms, said platform adapted, when placed in a horizontal position, to form a continuous table, and when said rods are rotated in their supports, the table will open in the center to deliver the metal strips, an adjustable trip to determine the lengths of the metal strips, for the purpose set forth.



3. The combination, in a sheet-metal straightening and cutting-off machine, with the straightening-rolls and cutting-off mechanism, of table-rod supports, a support therefor, rods journaled in such supports, table-arms rigidly mounted on such rods, platforms overlying such arms, gears rigidly mounted on the inner ends of said rods, segment-gears registering therewith, means for operating such segment-gears whereby the table-arms are opened and closed, springs mounted on such rods to assist in closing said table-arms, a trip-plate for determining the length of the metal strips and means whereby said trip-plate will actuate the cutting-off mechanism and cause the straightening-rolls to cease (temporarily) to rotate while the metal is being severed and the said table-arms are being opened, for the purpose set forth.

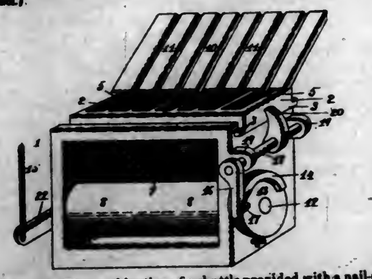
4. The combination, in an automatic sheet-metal straightening and cutting-off machine, of feeding and straightening mechanism, shearing-cutters through which the metal is fed from the said feeding and straightening mechanism, a two-section table forward of said cutters, said table adapted to open centrally, each section moving in opposite directions so as to deliver the severed strips flatwise of the metal and thus prevent scratching or marking the face of such strips, combined with a trip to limit the forward feed of said strips, substantially as set forth.

5. The combination, in an automatic sheet-metal straightening and cutting-off machine, of feeding and straightening mechanism, shearing-cutters through which the metal strip passes from said feeding and straightening mechanism, a two-section table forward of said cutters, said table adapted to open in the center, each section having a radial movement on its support so as to deliver the severed strips flatwise, a tripping device pivotally supported above such table when the sections thereof are closed, a balanced trip-lever or other like device connected with the cutting-off mechanism, means for connecting such lever with the tripping device so that, when the end of the metal strip engages such tripping device the cutting-off mechanism will be actuated, substantially as specified.

602,274. SHEET OR PLATE GIRDER. CYRUS B. SELL, Niles, Ohio. Filed Sept. 8, 1897. Serial No. 650,964. (No model.)

Claim.—1. A sheet or plate girder consisting of a series of trough-shaped portions having their sides provided with stiffening corrugations or ribs.

2. A sheet or plate girder composed of a series of trough shapes, and bent plates extending across the openings of the troughs and arranged to receive a filling.



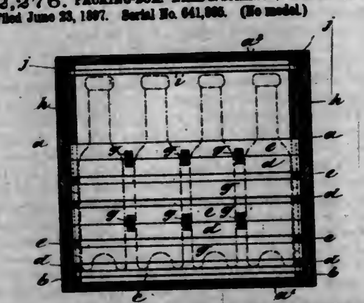
3. A sheet or plate girder consisting of a series of trough shapes having ceiling-strips secured to their bases.

4. A girder composed of alternate oppositely-extending trough portions, with flat bottoms provided with elongated slots for the adjustment of strips secured thereto.

5. The combination with a main girder, of a cross-girder consisting of a series of trough-shaped portions resting upon the flange of the main girder, and a leveling-wedge interposed between them.

6. The combination with two parallel main girders, of a cross-girder consisting of a series of trough-shaped portions resting upon the base flanges of the main girders, and arch-shaped plates located between the sides of the troughs and having their ends supported upon the main girders.

602,275. NAIL-SETTING MACHINE. ALONZO M. STEBBINS, Marlborough, Mass. Filed Sept. 16, 1897. Serial No. 651,893. (No model.)



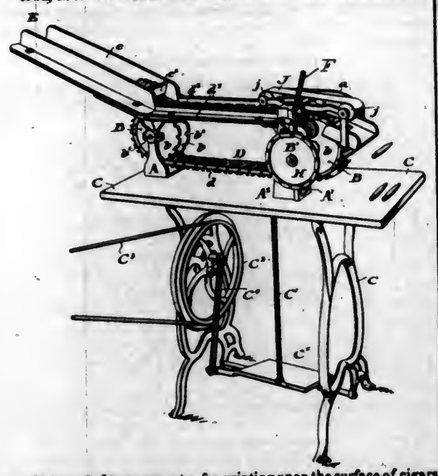
Claim.—1. The combination of a shuttle provided with a nail-slit, a shuttle-race having a nail-slit, a transverse projection or pin across the nail-slit in the shuttle and means for operating the shuttle.

2. The combination of a shuttle provided with a series of nail-slits, a shuttle-race, transverse pins or projections across said nail-slits, and means for operating the shuttle.

3. The combination of a shuttle having a nail-slit, a transverse pin across said slit, a shuttle-race, a conveyer leading from the shuttle, and means for operating the shuttle.

4. The combination of a shuttle having a nail-slit, having a pin or projection across said slit; a shuttle-race; an oscillating shaft having a nail slit or pocket, a conveyer between the shuttle and the shaft and means for operating the shuttle and shaft.

602,276. PACKING-BOX. NILS G. STAHLBERG, Stockholm, Sweden. Filed June 23, 1897. Serial No. 641,986. (No model.)



Claim.—1. The combination with a packing-box having grooves *z*, of a cushion base for the articles, and a cushion structure to rest on the articles, of tiers of cell structure, set in said grooves *z*, each of said tiers comprising end members *d* and *e*, the ends of which engage the grooves *z*, and partition members *g*, arranged at right angles to the members *d* and *e* and secured at their ends in the last-named members, said tiers being superposed in the grooves in the box and arranged with the members of alternate tiers crossed, substantially as set forth.

2. In a packing-box having an interior cell structure substantially as described, the superposed tiers each composed of members *d* and *e*, with their ends engaging grooves in the box, and partition members *g*, secured at their respective ends in the last-named members, said partition members being each composed of two strips or

laths placed side by side, but separated by blocks or pieces *k*, substantially as set forth.

3. The combination with the box having grooves *x* in its sides parallel with the ends thereof, of the base in the box consisting of the laths *b*, and the bottom laths *c*, supported in gains or notches in the laths *b*, a series of tiers, composed each of members *d* and *e*, engaging the grooves and partition members *g*, supported at their ends in gains or notches in the members *d* and *e*, said tiers being arranged so that the members of alternate tiers are at right angles.

602,277. PRINTING-MACHINE. GEORGE W. SWIFT, Jr., Bordentown, N. J. Filed June 4, 1897. Serial No. 639,429. (No model.)

Claim.—1. In an apparatus for printing upon the surface of cigars or other cylindrical bodies, a holder for the device to be printed, a flexibly supported printing wheel, and means for revolving the one about the other,—said printing wheel being caused to rotate idly by its contact with the device to be printed upon, substantially as set forth.

2. In a machine for printing upon the surface of cigars or other cylindrical bodies, the following instrumentalities in combination, namely:—a holder for the device to be printed, a printing wheel, means for supplying ink to the same, a flexible carrier for said printing wheel, and means for occasioning the revolution of said printing wheel about said device to be printed,—said printing wheel being mounted in such manner as to be idly rotated by its contact with said device to be printed upon substantially as set forth.

3. In an apparatus for printing upon the surface of cigars or other cylindrical bodies, a holding device for the article to be printed, a printing wheel mounted free for revolution upon an axle device, in such position as to be brought into contact as to its periphery with the article to be printed, means for causing one of said devices to travel around the other, and means for carrying said printing wheel at intervals bodily away from the device, substantially as set forth.

4. In an apparatus for printing upon the surface of cigars or other cylindrical bodies, a holding device for the article to be printed, an idly supported printing wheel mounted free for revolution upon a flexible axle device, in such position as to be brought into contact as to its periphery with the article to be printed, means for causing one of said devices to travel about the other, so that the frictional contact of the printing wheel with the article to be printed occasions the rotation of the printing wheel upon its axle device, and means for supplying ink to said printing wheel, substantially as set forth.

5. In an apparatus for printing upon the surface of cigars or other cylindrical bodies, a holding device for the article to be printed, a printing wheel mounted free for revolution upon a flexible axle device, in such position as to be brought into contact as to its periphery with the article to be printed, and to be rotated by its contact with the article to be printed, means for causing one of said devices to travel about the other, an inking pad, and means for carrying said inking pad and printing wheel into contact, substantially as set forth.

6. In a machine for printing upon cigars or similar cylindrical bodies, in combination, a conveyer, means for imparting intermittent movement to said conveyer, a printing wheel, a flexible shaft upon which said printing wheel is mounted free for rotation, and means for causing periodic revolutions of said flexible shaft,—substantially as set forth.

7. In a machine for printing upon cigars or other cylindrical bodies, in combination, a conveyer for the articles to be printed, means for occasioning the intermittent travel of said conveyer, a printing wheel, and means for causing said printing wheel to circumvolve in turn each of the bodies presented to it by the conveyer,—substantially as set forth.

8. In combination, in a machine for printing upon cigars or other cylindrical bodies, a conveyer, holders mounted upon said conveyer and adapted to contain each one of the bodies to be printed, an idle holder apron supported above said conveyer, and a plate which bears through said holder apron upon the articles as they pass beneath it, a printing wheel and means for causing said printing wheel to circumvolve each of said bodies in succession as said bodies come beneath the plate,—substantially as set forth.

9. In a machine for printing upon cigars and similar cylindrical bodies, in combination, a conveyer, means for occasioning the intermittent travel of said conveyer, a rotatable crank shaft into the vicinity of which the devices to be printed are successively carried, a crank arm mounted on said shaft, a flexible shaft mounted on said crank arm, a printing wheel mounted upon said flexible shaft, and driving mechanism in gear with said first mentioned shaft to occasion its intermittent revolution,—substantially as set forth.

10. In a machine for printing upon cigars and similar cylindrical bodies, in combination, a conveyer, means for occasioning the intermittent travel of said conveyer, a rotatable crank shaft into the vicinity of which the devices to be printed are successively carried, a crank arm mounted on said shaft, a flexible shaft mounted on said crank arm, a printing wheel mounted upon said flexible shaft, a driving mechanism in gear with said first mentioned shaft to occasion its intermittent revolution, and means for placing said printing wheel in contact with an inking device during the periods when said crank shaft is not revolving,—substantially as set forth.

11. In a machine for printing upon cigars and similar cylindrical bodies, in combination, a conveyer, means for occasioning the intermittent travel of said conveyer, a rotatable crank shaft into the vicinity of which the devices to be printed are successively carried, a crank arm mounted on said shaft, a flexible shaft mounted on said crank arm, a printing wheel mounted upon said flexible shaft, a driving mechanism in gear with said mentioned shaft to occasion its intermittent revolution, a constantly rotating inking disk, and means for automatically lowering said shaft first mentioned during the periods of its non-revolution to carry the printing wheel into contact with said ink disk,—substantially as set forth.

12. In a machine for printing upon cigars and other cylindrical bodies, in combination, a conveyer embodying a series of holders for the articles to be printed, a printing wheel, mechanism to operate said printing wheel to cause it to circumvolve successively the articles carried by the conveyer, mechanism for causing the travel of the conveyer, a reciprocating driving rack in gear with the printing wheel operating mechanism, and the conveyer mechanism, the arrangement being such that the printing wheel mechanism is inactive while the conveyer operating mechanism is in operation, and the conveyer operating mechanism is inactive when the printing wheel operating mechanism is in operation,—substantially as set forth.

13. In a machine for printing cigars and other cylindrical bodies in combination, a conveyer, a printing-wheel, mechanism for causing said printing wheel to circumvolve said cigars in succession, an operating rack which operates both mechanisms, and means for throwing said mechanisms, alternately into and out of operation, so that the printing mechanism is active when the conveyer mechanism is inactive and the conveyer mechanism is active when the printing mechanism is inactive,—substantially as set forth.

14. In a machine for printing upon cigars and other cylindrical bodies, in combination, a conveyer provided with a series of holders, a pair of conveyer wheels upon which said conveyer is mounted, means for causing the intermittent travel of said conveyer, a printing wheel, means for causing said printing wheel to successively circumvolve the cigars as the same are successively presented to it by the conveyer, a locking plate mounted upon the shaft of one of the conveyer wheels, said locking plate embodying a series of peripheral notches, a locking device which operates against said locking plate and is adapted to enter one of said recesses each time the conveyer pauses in its travel,—substantially as set forth.

15. In a machine for printing upon cigars and other cylindrical bodies, in combination, a conveyer, means for occasioning the intermittent travel of said conveyer, receiving devices with which said conveyer is equipped to receive the bodies to be printed, a crank shaft mounted in said machine and adapted to have a rotatory movement and also an up and down movement, a rock shaft provided with projecting arms, in which arms said crank shaft is journaled, a crank arm mounted on said crank shaft, a flexible shaft mounted on said crank arm, a printing wheel mounted on the extremity of said flexible shaft, an inking disk, means for causing the rotation of said crank shaft when in its uppermost position, means for automatically tilting said rock shaft to occasion the elevation of said first mentioned shaft to its uppermost position,—substantially as set forth.

16. In a machine for printing upon cigars and other cylindrical bodies, in combination, a conveyer, means for occasioning the intermittent travel of said conveyer, receiving devices with which said conveyer is equipped, to receive the bodies to be printed, a crank shaft mounted in said machine and adapted to have a rotary movement and also an up and down movement, a rock shaft provided with projecting arms in which arms said crank shaft is journaled, a crank arm mounted on said crank shaft, a flexible shaft mounted on said crank arm, a printing wheel mounted on the extremity of said flexible shaft, means for causing the rotation of said crank shaft when in its uppermost position, means for automatically tilting said rock shaft to occasion the elevation of said first mentioned shaft to its uppermost position,—a constantly rotating inking disk, and means for automatically occasioning the lowering of said crank shaft at regular intervals to carry the printing wheel into contact with said inking disk,—substantially as set forth.

17. In a machine for printing upon cigars and other cylindrical bodies, in combination, a conveyer, means for occasioning the intermittent travel of said conveyer, a crank shaft mounted in the framework of the machine and adapted to have both a rotatory and an up-and-down movement, a crank arm mounted on the said shaft, a flexible shaft mounted on said crank arm, a printing wheel mounted on said flexible shaft, an inking disk with which said printing wheel is in contact when the crank shaft is in its lowermost position, and means for automatically causing said crank shaft to alternately occupy its upper and its lower position,—substantially as set forth.

18. In a machine for printing upon cigars and other cylindrical bodies, in combination, a conveyer, means for occasioning the intermittent travel of said conveyer, a crank shaft mounted in the framework of the machine and adapted to have both a rotatory and an up-and-down movement, a crank arm mounted on the said shaft, a flexible shaft mounted on said crank arm, a printing wheel mounted on said flexible shaft, an inking disk with which said printing wheel is in contact when the crank shaft is in its lowermost position, means for automatically causing said first mentioned shaft to alternately occupy its upper and its lower position, means for occasioning the positive rotation of said crank shaft when in its uppermost position,—substantially as set forth.

19. In a machine for printing upon cigars and other cylindrical bodies, in combination, a conveyer, means for occasioning the intermittent travel of said conveyer, a crank shaft mounted in the framework of the machine and adapted to have both a rotatory and an up-and-down movement, a crank arm mounted on the said shaft, a flexible shaft mounted on said crank arm, a printing wheel mounted on said flexible shaft, an inking disk with which said printing wheel is in contact when the crank shaft is in its lowermost position, means for automatically causing said crank shaft to alternately occupy its upper and its lower positions, a gear wheel loosely mounted upon said shaft, a reciprocating rack in mesh with said wheel, and means for locking said wheel to said shaft during the period of the ascent of the rack,—substantially as set forth.

20. In a cigar printing machine, in combination, a crank shaft, a crank on said shaft, a flexible shaft on said crank, a printing wheel on said flexible shaft, a gear wheel loosely mounted on said crank shaft, a pawl carried by said gear wheel, a ratchet wheel fast on the shaft, a stop plate on said shaft, a pawl adapted to engage said stop plate, and a rack engaged with said tooth gear wheel,—substantially as set forth.

21. In a cigar printing machine, in combination, a shaft, a crank on said shaft, a flexible shaft on said crank, a printing wheel on said flexible shaft, a gear wheel loosely mounted on said crank shaft, a pawl carried by said gear wheel, a ratchet wheel fast on the shaft, a stop plate on said shaft, a pawl adapted to engage said stop plate, and a rack engaged with said toothed gear wheel, a collar fast on said shaft and provided with a tooth, a long tooth on said rack adapted to engage with the tooth on said collar,—substantially as set forth.

22. In a cigar printing machine, in combination, a shaft, a crank on said shaft, a flexible shaft on said crank, a printing wheel on said flexible shaft, a gear wheel loosely mounted on said crank shaft, a pawl carried by said gear wheel, a ratchet wheel fast on the shaft, a stop plate on said shaft, a pawl adapted to engage said stop plate, and a rack engaged with said toothed gear wheel, a collar fast on said shaft and provided with a tooth, a long tooth on said rack adapted to engage with the tooth on said collar, elongated slots in the frame of the machine in which said shaft is journaled, a rock shaft having arms with cylindrical bearings in which said shaft is journaled, a rock arm attached to said rock shaft, a pivoted link connected to said rock arm, the lower end of which bears against the lower face of the rack, and a cam face on said rack,—substantially as set forth.

23. In a cigar printing machine, in combination, a shaft, a crank on said shaft, a flexible shaft on said crank, a printing wheel on said flexible shaft, a gear wheel loosely mounted on said shaft, a pawl carried by said gear wheel, a ratchet wheel fast on the shaft, a stop plate on said shaft, a pawl adapted to engage said stop plate, and a rack engaged with said toothed gear wheel, a collar fast on said shaft and provided with a tooth, a long tooth on said rack adapted to engage with the tooth on said collar, elongated slots in the frame of the machine in which said shaft is journaled, a rock shaft having arms with cylindrical bearings in which said shaft is journaled, a rock arm attached to said rock shaft, a pivoted link connected to said rock arm, the lower end of which bears against the lower face of the rack, a cam face on said rack, a bracket through which the central portion of said pivot link extends, a stop mounted on said pivot link, and a spiral spring confined between said bracket and said stop,—substantially as set forth.

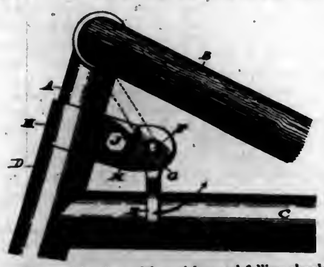
24. In a cigar printing machine, in combination, a holder for a cigar, a shaft, a crank arm mounted on said shaft, a flexible shaft connected to said crank arm, and a printing wheel mounted on said flexible shaft, substantially as set forth.

25. In a machine for printing cigars, in combination, a cigar holder, a shaft, a crank arm mounted on said shaft, a flexible shaft adjustably mounted in said crank arm, and a printing wheel mounted on said flexible shaft, substantially as set forth.

26. In a machine for printing cigars, in combination, a holder for cigars, a shaft, a crank arm mounted on said shaft, a flexible shaft mounted on said crank arm, and consisting of two independent parts supported in axial relationship by a spiral spring connected to both, and a printing wheel mounted on said flexible shaft, substantially as set forth.

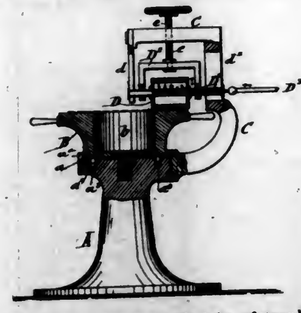
27. In a cigar printing machine, in combination, a holder for a cigar, a shaft adapted for both rotary and up-and-down movement, a crank arm mounted on said shaft, a flexible shaft connected to said crank arm, and a printing wheel mounted on said flexible shaft, substantially as set forth.

602,278. PLOW. FRANK I. WOODWARD, Hudson, Mich. Filed Oct. 20, 1897. Serial No. 655,832. (No model.)



Claim.—1. In a plow, the combination with the beam, the standard formed with a convex corrugated portion provided with horizontal elongated slots, of the plate formed with bolt-holes and having a corrugated concave portion or recess engaging with said convex portion of the standard, and also having a corrugated convex portion or rib engaging with a corresponding concave recess and the bolts passing through said holes and slots in the beam, substantially as described.

2. In a plow, the combination with the beam formed with a recess in the side, of the plate formed on one side with a convex rib



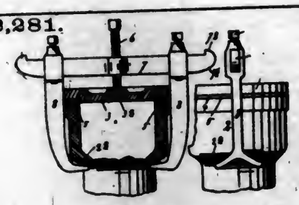
seated in said recess and in its opposite side formed with a concave corrugated recess, the apertured lugs at diagonal corners, the plate having a corrugated convex portion engaging with said recess, and the other side made straight or plain, the jointer abutting against the same, and the yoke passing around said arm and through said lugs, substantially as described.

602,279. BICYCLE RETAINER AND LOCK. JAMES RATTERBY, Philadelphia, Pa. Filed Nov. 20, 1896. Serial No. 612,828. (No model.)

Claim.—The combination with a rising-and-falling shackle having an eye thereon, of a clip, necks rearward of the ends of said clip, ears rearward of said necks, a screw in said necks, and a screw in said eye and ears, said necks being practically rigid, and said ears being practically elastic and said clip, necks and ears being integral continuities of each other.

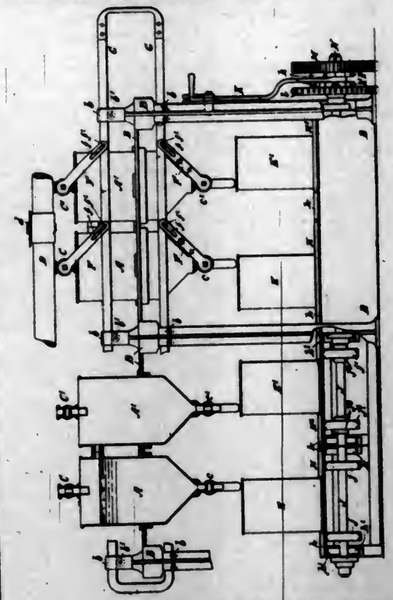
602,280. MACHINE FOR IRONING BRIMS OF STRAW HATS. AUGUST BOEHEIM, New York, N. Y. Filed July 30, 1897. Serial No. 646,455. (No model.)

Claim.—1. A machine for ironing the brims of straw hats, which consists of a suitable support, a hat-block rotatably mounted upon said support, means carried by said hat-block whereby it may be rotated back and forth beneath the iron, a bracket carried by said hat-block support, and a rotary iron vertically adjustable in said bracket above the rim of the hat-block, substantially as set forth.



2. A machine for ironing the brims of straw hats, consisting of a hat-block constructed with a surrounding rim for the brim of the hat and rotatably mounted upon a suitable support, means carried by said hat-block whereby it may be rotated back and forth beneath the iron, a bracket carried by the hat block support, a rotary iron adjustably mounted in said bracket above the rim of the hat-block and means for vertically adjusting the iron toward the said rim, substantially as set forth.

3. In a machine for ironing the brims of straw hats, the combination of a cylindrical iron, a tubular shaft for the same, a U-shaped hanger for supporting said shaft, a slotted strap for guiding the tubular shaft, and means for raising and lowering the U-shaped frame, substantially as set forth.



602,281. TESTING-CAP AND CLAMP. PATRICK J. CAHILL, Utica, N. Y. Filed Jan. 12, 1894. Serial No. 496,634. (No model.)

Claim.—The combination in a clamp for securing a testing-cap, of a main bar, hooked arms adapted to engage under the shoulder of a soil-pipe and adjustable on the main bar, set-screws for securing the arms in adjusted position on the main bar, and a main set-screw threaded into the middle of the main bar and adapted to press upon the cap, substantially as set forth.

602,281.

602,282. APPARATUS FOR FILLING OIL-CANS. ANDREW CAMPBELL and JAMES URIE, Rangoon, Burmah, assignors to the Burmah Oil Company, Limited, same place and Glasgow, Scotland. Filed Nov. 2, 1896. Serial No. 610,794. (No model.)

Claim.—1. In an apparatus for filling oil-cans from a storage-tank, the combination of two filling-tanks A, A' each having inlets and discharge-outlets and valves in each of said inlets and outlets, levers F attached to said valves, and the double-armed bar or handle G connected to all of said levers and operating the valves in such manner that the inlet and outlet valves of each tank are opened and closed alternately and the valves of tank A are operated reversely to those of tank A'.

2. In an apparatus for filling oil-cans from a storage-tank, the combination with two discharge-outlets, of means for feeding cans alternately below said outlets, comprising feeding or can-supporting parts mounted to move independently, an operating-lever and connecting devices, such as ratchets and pawls between said lever and the can-supporting parts, whereby the same are moved alternately by motions of the lever in opposite directions.

3. In an apparatus for filling oil-cans, the combination with two discharge outlets, of can-supporting bands located beneath said outlets, shafts supporting and operating said bands, an operating-lever and reversely-placed pawl-and-ratchet connections between said lever and shafts whereby the bands are moved alternately by reverse movements of said lever.

602,283. MOTOR-VEHICLE. LOUIS S. CLARKE, WILLIAM MORGAN, and WILLIAM S. GORDON, Pittsburg, Pa., assignors to the Pittsburgh Motor Vehicle Company, same place. Filed Dec. 16, 1897. Serial No. 662,103. (No model.)

Claim.—1. In motor-vehicles, the combination of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine supported adjacent to said shaft, a gear-wheel loosely mounted around said shaft and connected to the motor, and mechanism connected to said gear-wheel and shaft for starting and driving the vehicle, substantially as set forth.

2. In motor-vehicles, the combination of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine supported adjacent to said shaft, a gear-wheel loosely mounted around said shaft and connected to the motor, a cap or collar fitting loosely around the shaft and having a spring connection with the gear-wheel, and mechanism connected to said cap or collar for starting and driving the vehicle, substantially as set forth.

3. In motor-vehicles, the combination of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said shaft, a gear-wheel loosely mounted around said shaft and connected to the motor, a cap or collar fitting loosely around the shaft and having a spring connection with the gear-wheel, a band-wheel rigidly secured to said shaft, a friction-ring formed in sections adapted to engage with the band-wheel, and mechanism connected to said cap or collar and band-wheel for starting and driving the vehicle, substantially as set forth.

4. In motor-vehicles, the combination of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said shaft, a gear-wheel loosely mounted around said shaft and connected to the motor, a cap or collar fitting loosely around the shaft and having a spring connection with the gear-wheel, a band-wheel rigidly secured to said shaft, a friction-ring formed in sections adapted to engage with the band-wheel, and mechanism connected to said cap or collar, band-wheel and friction-ring for starting and driving the vehicle, substantially as set forth.

5. In motor-vehicles, the combination of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said shaft, a gear-wheel loosely mounted on said shaft and connected to the motor, a cap or collar fitting loosely around the shaft and having a spring connection with the gear-wheel, a band-wheel rigidly secured to said shaft, a friction-ring formed in sections adapted to engage with the band-wheel, cams fitting between the sections of the friction-ring and connected to the cap or collar, and means on said band-wheel adapted to engage with said cams for starting and driving the vehicle, substantially as set forth.

6. In motor-vehicles, the combination of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said shaft, a gear-wheel loosely mounted on said shaft and connected to the motor, a cap or collar fitting loosely around the shaft and having a spring connection with the gear-wheel, a band-wheel rigidly secured to said shaft, a friction-ring formed in sections adapted to engage with the band-wheel, cams fitting between the sections of the friction-ring and connected to the cap or collar, and a clutch around said shaft having arms thereon adapted to engage with a ring bearing against the cams for starting and driving the vehicle, substantially as set forth.

7. In motor-vehicles, the combination with a shaft having pedals thereon, of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said axle or shaft, a gear-wheel loosely mounted on said axle or shaft and connected to the motor, and means connected to said pedals or shaft and gear-wheel for revolving said axle or shaft to start the motor, substantially as set forth.

8. In motor-vehicles, the combination with a shaft having pedals thereon, of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said axle or shaft, a gear-wheel loosely mounted on said axle or shaft and connected to the motor, a ratchet-wheel having a pawl engaging therewith connected to said gear-wheel, and means connected to said pedals or shaft and the pawl for revolving said axle or shaft to start the motor, substantially as set forth.

9. In motor-vehicles, the combination with a shaft having pedals thereon, of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said axle or shaft, a gear-wheel loosely mounted on said axle or shaft and connected to the motor, a ratchet-wheel connected to said gear-wheel, a sprocket-wheel rigidly secured to said axle or shaft having a pawl mounted thereon for engaging with the ratchet-face, and connections from said sprocket-wheel to the pedals or shaft for revolving said axle or shaft to start the motor, substantially as set forth.

10. In motor-vehicles, the combination with a shaft having pedals thereon, a motor or engine adjacent to said axle or shaft, a gear-wheel loosely mounted on said axle or shaft and connected to the motor, connections from the pedals or shaft to the axle or shaft, and means on said axle or shaft for permitting the vehicle to be propelled from the pedals or shaft, substantially as set forth.

11. In motor-vehicles, the combination with a shaft having pedals thereon, of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said axle or shaft, a gear-wheel loosely mounted around said axle or shaft and connected to the motor, connections from the pedals or shaft to the axle or shaft, a gear-wheel or pinion secured on said axle or shaft, and means connected to said pedals or shaft and gear-wheel or pinion for permitting the vehicle to be propelled from the pedals or shaft, substantially as set forth.

12. In motor-vehicles, the combination with a shaft having pedals thereon, of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said axle or shaft, a gear-wheel loosely mounted around said axle or shaft and connected to the motor, a gear-wheel or pinion secured on said axle or shaft, a sprocket-wheel loosely mounted on said axle or shaft and connected to the pedals or shaft, and a dog or pawl mounted on said sprocket-wheel adapted to be held in engagement with the gear-wheel or pinion for permitting the vehicle to be propelled from the pedals or shaft, substantially as set forth.

13. In motor-vehicles, the combination with a shaft having pedals thereon, of an axle or shaft having supporting and driving wheels mounted thereon, a motor or engine adjacent to said axle or shaft, a gear-wheel loosely mounted around said axle or shaft and connected to the motor, a gear-wheel or pinion secured on said axle or shaft, a sprocket-wheel loosely mounted on said axle or shaft and connected to the pedals or shaft, a dog or pawl mounted on said sprocket-wheel, and a movable bolt or pin on said sprocket-wheel adapted to engage with the gear-wheel or pinion for permitting the vehicle to be propelled from the pedals or shaft, substantially as set forth.

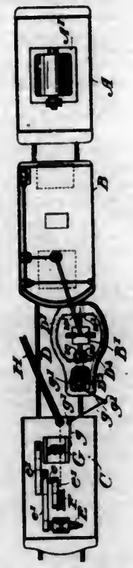
14. In motor-vehicles, the combination with an axle or shaft, of supporting and driving wheels loosely mounted around said axle or shaft, hollow caps secured to said wheels around the axle or shaft and provided with bearing surfaces therein, cams or bearing-blocks secured to said axle or shaft, and rollers loosely mounted in standards loosely mounted around the axle or shaft, said rollers being adapted to travel on the cams or bearing-blocks and engage with the bearing-surfaces on the hollow caps for permitting the wheels to be automatically secured to and be freed from said axle or shaft, substantially as set forth.

15. In motor-vehicles, the combination with an axle or shaft, of supporting and driving wheels loosely mounted around said axle or shaft, hollow caps secured to said wheels around the axle or shaft and provided with bearing surfaces therein, cams or bearing-blocks secured to said axle or shaft, rollers loosely mounted in standards loosely mounted around the axle or shaft, said rollers being adapted to travel on the cams or bearing-blocks and engage with the bearing-surfaces in the hollow caps for permitting the wheels to be automatically secured to and freed from said axle or shaft, and clamping-plates fitting around the axle or shaft and adapted to be removably secured to the hollow caps for confining the parts within the hollow caps, substantially as set forth.

602,284. TRACK-WELDING. RICHARD BYAR, Johnstown, Pa., assignor to the Johnson Company, Lorain, Ohio. Filed Sept. 22, 1897. Serial No. 653,523. (No model.)

Claim.—1. The combination with the terminals spacing the ends of the rails, of dies and contacts, detached from said terminals, and secured directly to the sides of said rails, and an upsetting-tool surrounding said terminals and secured to both rails.

2. The herein-described method of welding rails together while permanently laid in the track which consists in passing the current from a suitable source of supply diagonally through the juxtaposed rail ends and then moving the rails longitudinally through the road-bed to upset and compress the heated metal.



3. In electric welding apparatus a contact bearing against one side of one of the articles to be welded, and a second contact bearing against the other side of the other of said articles.

4. The combination of a pair of detached contacts secured to the sides of the rails, a pair of terminals adapted to contact with said contacts, a yoke passing around said terminals and at one end engaging one rail, and a movable plunger at the other end of said yoke engaging the other rail.

5. The combination with the terminals of the transformer, of a pair of contacts engaged thereby and bearing against the articles to be welded at positions diagonally disposed with relation to the joint, and insulated dies bearing against each of the articles and opposite to the contacts, and means for moving the said articles and the contacts and dies toward each other.

6. The combination of a pair of contacts bearing against the side

of the rails and diagonally disposed relatively to the ends thereof, a pair of dies having insulating members occupying positions opposite to those of the contacts, and the transformer terminals bearing against the backs of the contacts and dies.

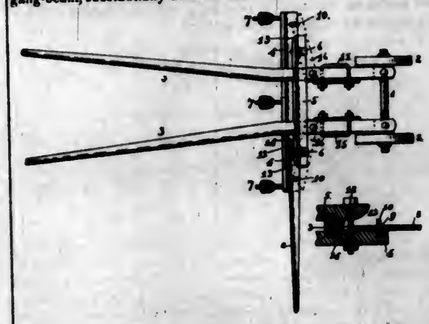
7. A tool for moving rails longitudinally through the track and toward each other comprising a yoke surrounding the ends of the rails, jaws at one end of the yoke for engaging one of the said rails, a cylinder bearing against the other end of the yoke and a plunger extending from said cylinder and having jaws for engaging the other of the said rails.

8. A contact adapted to bear against one side of the rail and a die adapted to bear against the opposite side thereof, in combination with a pair of back-stops entering recesses in their rear ends and bolted together through a hole in the rail.

9. The combination of the diagonally-disposed contacts 3 and 4, the diagonally-disposed insulated dies 5 and 6, the back-stops 8 secured to the rails to be welded and engaging the rear ends c^c the contacts and the dies, the top and bottom clamps 11 and 12, and the members 13 connecting the same and forcing them into contact with the top and bottom of the rails.

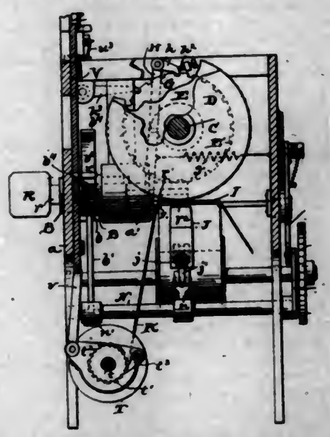
10. The combination with means for heating and upsetting the ends of the rails, of contacts and dies bearing against the sides of the rails near the ends thereof, and members secured together and bearing respectively against the top and bottom of the rails at the ends thereof.

11. The combination with a stationary transformer having terminals spanning the rails to be welded, of contacts bearing against the side of the rails, and means, controlled by the movement of the terminals, for adjusting the position, and relative pressure of the contacts against different portions of the rail.



12. In a welding apparatus the combination of a pair of contacts each bearing against a side of one of the articles to be welded and a pair of vertically and transversely movable transformer-terminals bearing against the back of the contacts, and controlling the path of the current through the said articles by their relative vertical and transverse positions, in relation to the contacts.

13. The combination of the contacts 3 and 4 having the lugs 3^d and 4^d, with the transformer-terminals 7 having the projections 7^a extending between said lugs.



14. The combination of a car, a crane carried thereby and in turn carrying a tool for moving rails longitudinally through the track, a source of motive power upon the car, connections therefrom to a power-pump, a pipe system from the pump to the cylinder of the said tool, and swinging joints in said pipe system for allowing freedom of movement to the tool.

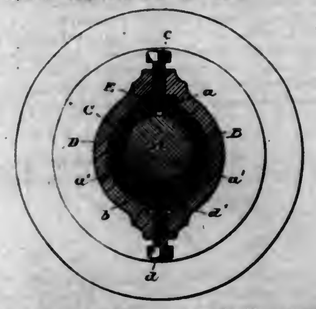
602,285. GARDEN-CULTIVATOR. ADAM FISCUS, Fiscus, Iowa. Filed Sept. 20, 1897. Serial No. 652,286. (No model.)

Claim.—In a wheeled hand cultivator, the combination of the axle-wheels and cultivator-handles, a removable gang-beam secured rigidly to both of said handles, an attaching-clip at each end of the gang-beam upon either side of the cultivator, and an attaching shackle or clip adapted for use upon the cultivator forward of the gang-beam, substantially as described.

602,286. TIME-RECORDER. JAMES H. GERRY, Brooklyn, N. Y., assignor, by mesne assignments, to I. P. Lampson, Cleveland, Ohio. Filed Jan. 14, 1897. Serial No. 619,214. (No model.)

Claim.—1. In a time-recording machine, in combination, a rotatable shaft, a wheel having sixty teeth secured to said shaft, a spring-actuated lever, a pawl carried thereby which engages with said toothed wheel, an electromagnet, the armature therefor secured to said lever, mechanism for temporarily closing the circuit of said magnet at minute intervals, a sleeve loosely mounted on said shaft, a toothed wheel secured to said sleeve, a cam secured to said shaft, a spring-actuated lever arranged to be engaged and operated by said cam, and a pawl carried by said lever engaging with the last-named toothed wheel, said mechanism constituting the entire mechanism for properly moving the hour and minute printing-wheels which are secured respectively to said sleeve and shaft, substantially as specified.

2. In a time-recording machine, in combination, a rotatable tape-spool, mechanism for turning it, a vertically-movable bar for actuating said mechanism, the key-hub, a fork-arm secured thereto, and a pin upon said bar between the forks of said arm, substantially as and for the purpose specified.



3. In a time-recording machine, in combination, a rotatable shaft, a tape spool secured thereto, a ratchet also secured to the shaft, a cradle mounted upon the shaft, a pawl carried thereby and engaging with the ratchet, a vertically-movable bar, a link connecting it with the cradle, the key-hub, a forked arm secured thereto, and a pin on the bar between the forks of said arm, substantially as and for the purpose specified.

4. In a time-recording machine, in combination, a bell, its striking-lever, a tripping-pawl pivoted to said lever, a vertically-movable bar having a pin which engages with said tripping-lever, the key-hub, a forked arm secured thereto, and a pin on said bar between the forks of said arm, substantially as and for the purpose specified.

5. In a time-recording machine, in combination, the printing-wheels, key-hub, a printing-pad, a lever to which said pad is secured, a rock-shaft, a toggle connection between the rock-shaft and pad-lever, arms secured respectively to the key-hub and rock-shaft, and a link connecting said arms, substantially as and for the purpose specified.

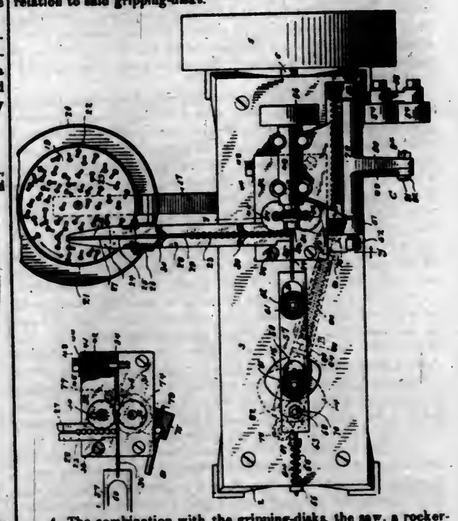
6. In a time-recording machine, in combination, two inking-ribbon spools, ratchets secured thereto, a pivoted lever, two pawls carried thereby and adapted to engage severally with said ratchets, a rock-shaft, an arm secured thereto, a pin on said arm or lever, and forks on the other part between which the said pin lies, substantially as and for the purpose specified.

602,287. JOURNAL-BOX. THOMAS W. GREEN, Philadelphia, Pa., assignor to the Wilbraham Baker Blower Company, same place. Filed Jan. 18, 1898. Serial No. 667,045. (No model.)

Claim.—1. In a journal-box, an open bushing surrounding the shaft and concentric therewith, in combination with an open eccentric collar fitting inside the journal-box and means for closing said collar around the bushing, substantially as shown and for the purpose described.

2. In a journal-box, the combination of the shaft A, and bushing B formed concentric with the shaft and having therein a longitudinal slot, with the open eccentric collar C, and the gib E, resting upon the eccentric collar and means for compressing said gib against the eccentric collar and thereby closing the concentric bushing around the shaft, substantially as shown and described.

3. In a journal-box, the open bushing B, adapted to fit around the shaft and concentric therewith, in combination with the open eccentric collar C, fitting around the bushing B, the gib E, and the set-screw *c*, substantially as shown.



4. In a journal-box, the open bushing B, adapted to fit around the shaft A, and formed concentric therewith, in combination with the open eccentric collar C, the wedge-shaped block *d'*, fitting into the slot *b*, means for moving the block up and down, and the gib E, resting upon the eccentric collar and provided with means for forcing it against said collar, all arranged substantially as shown and for the purpose described.

602,288. MACHINE FOR SLOTTING SCREWS. HARVEY HUBBELL, Bridgeport, Conn. Filed July 17, 1897. Serial No. 644,965. (No model.)

Claim.—1. In a machine for slotting screw-blanks, the combination with feeding mechanism to deliver the blanks to the slotting instrumentalities, of gripping-disks rotating in a horizontal plane which receive the blanks from the said feeding mechanism between their peripheries, means for imparting an intermittent rotation to said gripping-disks, a slotting device carried by a rocker-arm, and mechanism by means of which said rocker-arm is tilted so as to bring the said slotting device into operative relation to the blank at the time when said blank is held stationary by the said gripping-disks.

2. In a machine for slotting screw-blanks, the combination with feeding mechanism to deliver the blanks to the slotting instrumentalities, of a pair of horizontally-gripping disks having notches formed in their edges for the reception of the bodies of the blanks as they come from the feeding mechanism, mechanism for imparting an intermittent rotation to said gripping-disks, a rotary slotting-saw, a rocker-arm by which said saw is carried, and means for tilting said arm and bringing the said saw into operative relation to the blank at the time when said blank is held stationary by said notched gripping-disks.

3. In a machine for slotting screw-blanks, the combination with feeding mechanism to deliver the blanks to the slotting instrumentalities, of a pair of intermittently-rotated notched gripping-disks which receive the blanks from the said feeding mechanism, one of said gripping-disks being movable bodily relative to the other, means to normally force said movable disk yieldingly against the other, so that the blanks are held with a spring-grip, and a slotting-saw in operative relation to said gripping-disks.

4. The combination with the gripping-disks, the saw, a rocker-arm by which the saw is carried and mechanism for tilting the rocker-arm, of an inclined slotted way, a rotating blank-holder having a spiral incline 21 and a pivoted slotted finger adapted to be raised by the incline so that blanks picked up by the finger will pass into the slotted way.

5. The combination with a rotating blank-holder having a spiral incline, of a pivoted slotted finger adapted to pick up blanks lying loosely in the holder and to be raised by the incline on the blank-holder.

6. The combination with a rotating blank-holder having a spiral incline terminating in a shoulder, of a pivoted slotted finger adapted to pick up blanks lying loosely in the holder and to be raised by the incline until the free end is higher than the pivoted end, the finger then passing off at the shoulder and the free end dropping down into the blank-holder.

7. The combination with a rotating blank-holder having a spiral incline, and an inclined slotted way, of a slotted finger adapted to pick up blanks lying loosely in the holder and pivoted at the upper end of the way, said finger being adapted to be raised by the incline until the free end thereof is higher than the pivoted end so that blanks picked up by the finger will pass into the slotted way.

8. The combination with the gripping-disks and fixed and pivoted blocks by which they are carried, of a rotating blank-holder having a spiral incline, an inclined slotted way and a pivoted slotted finger adapted to pick up blanks in the holder and to be raised by the incline so that blanks picked up by the finger will pass into the way and a feed-slide by which the blanks are moved forward singly into position to be gripped by the disks.

9. The combination with the gripping-disks and fixed and pivoted blocks by which they are carried, said blocks having a recess 34 between them, of a rotating blank-holder having a spiral incline, an inclined slotted way leading into said recess, a pivoted slotted finger adapted to travel up the incline by which blanks are picked up in the holder and passed to the slotted way and a feed-slide by which blanks in the recess are carried forward singly into position to be gripped by the disks.

10. In a machine of the character described the combination with intermittently-rotated gripping-disks, of fixed and pivoted blocks by which they are carried, said blocks having a recess between them adapted to receive the shanks but not the heads of the blanks, a spring to normally force said blocks and gripping-disks together, a way from which blanks pass to the recess with the heads upward, and a feed-slide reciprocating in said recess which moves the blanks forward singly into position to be gripped by the disks.

11. The combination with the gripping-disks, shafts by which they are carried, fixed and pivoted blocks in which said shafts are journaled and intermeshing pinions on said shafts, of a ratchet fixed to one of said shafts below the pinion, a lever pivoted on said shafts

below the ratchet and carrying a pawl engaging the ratchet and means for oscillating the lever substantially as described for the purpose set forth.

12. The combination with the gripping-disks, shafts therefor, fixed and pivoted blocks in which said shafts are journaled, and intermeshing pinions on said shafts, of a ratchet on one of said shafts, a lever pivoted on said shaft below the ratchet and carrying a pawl engaging the ratchet, cam 14, a connecting-rod carrying a roller engaging said cam and a spring 79 for retaining the roller in engagement with the cam.

13. The combination with the gripping-disks, shafts therefor, fixed and pivoted blocks in which said shafts are journaled and intermeshing pinions on said shafts, of a ratchet on one of said shafts, a lever pivoted on said shaft below the ratchet and carrying a pawl engaging the ratchet, a spring 79 acting to draw the lever in one direction, cam 14, and a connecting-rod comprising members 80 and 81, said member 80 carrying a roller engaging the cam, a stump 83 through which the member 81 passes and a stump 84 through which member 81 passes freely and said member 81 carrying a collar and a spring 86 which bears against the collar and the stump 83, said spring 86 being stronger than spring 79 but adapted to yield should clogging occur and thereby prevent damage to any portion of the machine.

14. The combination with the table, a block 31, bolted to the table and a block 32 pivoted to the table, said blocks having a recess 34 between them, of intermittent gripping-disks carried by said blocks and having corresponding notches to form recesses *a*, a bolt 43 passing loosely through block 32 and engaging block 31, a spring acting to hold the gripping-disks normally in contact, and a feed-slide by which the blanks are moved forward singly into one of the recesses *b*, the spring yielding to permit the blank to enter the recess, where it is retained until the next actuation of the disks.

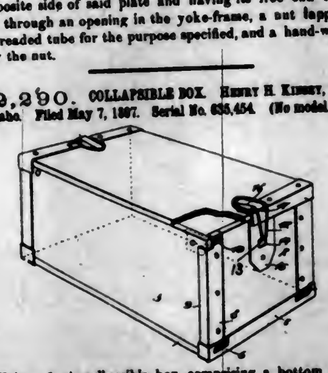
15. The combination with the fixed block, pivoted block and intermittent gripping-disks carried by said blocks and having corresponding notches to form recesses *a*, of a spring acting to hold the disks normally in contact, said blocks having a recess 34 between them and being cut away in their opposite faces to form a recess 46, and a feed-slide by which each blank is moved forward into one of the recesses *a*, said blank being released and dropping through recess 46 at the next actuation of the disks.

16. In a machine for slotting screw-blanks, the combination with suitable feeding mechanism, of intermittently-rotated, spring-pressed gripping-disks which receive the blanks from the feeding mechanism, a slotting saw, a rocker-arm in which said saw is mounted, and means to tilt said rocker-arm and force the said slotting-saw into operative relation to said blank at the moment the spring-pressed gripping-disks bring the blank to its stationary position.

17. In a machine for slotting screw-blanks, the combination with suitable feeding mechanism, of a pair of intermittently-rotated, spring-pressed gripping-disks having notches formed in their gripping-peripheries, which receive the blanks independently and hold them stationary during the slotting operation, a slotting-saw, a rocker-arm 50 in which said saw is mounted, a thrust-rod 89 connected with said rocker-arm 50, a roller 88 on said thrust-rod, a rotating cam 87 which bears against said roller and imparts movement to said thrust-rod and rocker-arm, and a spring 90 to hold the roller 88 in contact with said cam 87 and normally raise the rocker-arm 50 so as to keep the saw out of its cutting position.

18. The combination with the fixed block, pivoted block, intermittent gripping-disks carried by said blocks, and having corresponding notches to form recesses *a*, and a spring acting to hold said disks normally in contact, said blocks having a recess 34 between them and being cut away in their opposite faces to form a recess 46 and a feed-slide by which the blanks are moved forward singly and placed in engagement with one of the recesses *a*, a saw, a rocker-arm by which it is carried and mechanism for tilting the rocker-arm at the instant a blank is held by the disks whereby the head of the blank is slotted.

19. The combination with the feeding mechanism and the intermittent gripping-disks, of the saw, a rocker-arm by which the saw is carried, spring 90, cam 87, connecting-rod 89 carrying a roller engaging the cam and having a circular recess 93, an eccentric bushing in said recess and a bolt 91 passing through the rocker-arm and through the eccentric bushing whereby the movement of the rocker-arm may be adjusted to regulate the depth of the cut made by the saw.



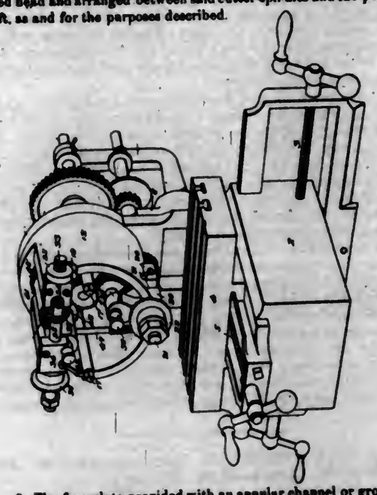
602,289. PIPE-TESTING MACHINE. CLARENCE M. KEMP and CHARLES E. KEMP, Baltimore, Md. Filed Sept. 15, 1897. Serial No. 651,814. (No model.)

Claim.—1. In a pipe-testing apparatus, the combination with a yoke-frame arranged to engage a collar or projection on a pipe, of a plate adapted to cover the end of the pipe and provided with a rubber gasket upon one side and a threaded tube projecting from the opposite side, said tube passing freely through an opening in the yoke-frame, and a nut tapped upon the said threaded tube, as and for the purpose specified.

2. In a pipe-testing apparatus, the combination with a yoke-frame arranged to engage a collar or projection on a pipe, of a plate adapted to cover the end of the pipe and provided with a rubber gasket upon one side, an externally-threaded tube rigidly secured to the opposite side of said plate and having its free end extending loosely through an opening in the yoke-frame, a nut tapped upon said threaded tube for the purpose specified, and a hand-wheel carried by the nut.

602,290. COLLAPSIBLE BOX. HENRY H. KIBBY, Shoshone, Idaho. Filed May 7, 1897. Serial No. 635,454. (No model.)

Claim.—1. A collapsible box, comprising a bottom piece, end pieces having detachable hinge connection with the bottom piece, slideways on the end pieces, side pieces adapted for engagement within the slideways, a cover having flanges at its ends to engage over the end pieces, and removable fastening devices for securing the cover in place when the box is formed and also serving to secure the several parts together when assembled for reshipment, substantially as specified.



2. A collapsible box, comprising a bottom board, end boards having detachable hinge connections with said bottom board, corner-plates on said end boards forming slideways, side boards adapted for engagement with their ends in said slideways, hook portions on the ends of said side boards near the top for engaging against the outer sides of the end boards, a cover having flanges at its ends to engage over the outer sides of the end boards, and removable fastening devices for securing the top board in position when the box is formed, and also for securing the several parts of the box together when assembled for reshipment, substantially as specified.

3. A collapsible box, comprising a bottom board, end boards having removable hinged connection therewith, corner-plates on the ends of the end boards forming slideways, side boards having their ends seated in said slideways, a top board having depressions in its upper surface at the ends and shoulders at the outer ends of said depressions, plates on the end boards having openings, wire bails having hook portions to engage in said openings, and substantially wedge-shaped cam-blocks having swinging connection with the wire bails and adapted for engagement with the shoulders, substantially as specified.

602,291. MILLING-CUTTER FOR METAL-WORKING MACHINES. ANDREW KLAY, Bluffton, Ohio. Filed Apr. 22, 1897. Serial No. 633,345. (No model.)

Claim.—1. The combination with a post, and a work-bed, of a revoluble head, a central power-shaft, a cutter-spindle 21 journaled on said head, a slidable arrow carried by the head and adapted to be operatively connected with or disconnected from the power-shaft and said spindle, another spindle 25 journaled on the head at right angles to the spindle 21, and a train of gear connections, including another slidable arbor, between the power-shaft and the cutter-spindle 25, as and for the purposes described.

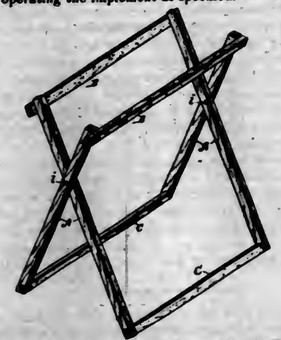
2. The combination of a face-plate carried by a suitable post, a revoluble chambered head fitted laterally against said face-plate and connected thereto to rotate or turn on the same, a power-shaft arranged centrally to said head, independent cutter-spindles carried by the head, and independent gear connections housed within said chambered head and arranged between said cutter-spindles and the power-shaft, as and for the purposes described.

3. The face-plate provided with an annular channel or groove, a rotatable chambered head fitted against said face-plate, and bolts connected to the head and fitted in said channel or groove to travel therein, combined with a power-shaft, and independent exposed spindles journaled on said head and gearing housed in the chambered head and connecting the cutter-spindles independently with said power-shaft, as and for the purposes described.

4. The face-plate provided with an annular channel or groove, a rotatable head having an annular rib fitted in said channel or groove, bolts having heads which travel in said channel and pass through the head, and nuts on the bolts pressing against the sleeves to hold the head rigidly in position, combined with a power-shaft, cutter spindles carried by the head, and gearing between said spindles and the power-shaft, as and for the purposes described.

5. The combination with a post, and a work-bed, of a horizontally-arranged head connected to said post to rotate on its horizontal axis and arranged to overhang the bed, spindles carried by said head and arranged at an angle to each other, a power-shaft common to both spindles, and slidable arbors forming part of the train of gears for connecting the power shaft and the spindles, as and for the purposes described.

6. The combination with a post, and a work-bed, of a power-shaft, a revoluble head connected to said post and arranged concentric with said power-shaft, cutter-spindles carried by said revoluble head and arranged at an angle to each other, and arbors carried by said head and geared with the power-shaft and said spindles, each arbor being adjustable in the head to disconnect the cutter-spindle and the power-shaft, as and for the purposes described.



7. The combination with a post, and a work-bed, of a power-shaft, a revoluble head concentric with said shaft and connected to the post, cutter-spindles carried by said head, independent slidable arbors adapted to operatively connect the cutter-spindles with the power-shaft, and means for locking the arbors in their adjusted positions, substantially as described.

8. The combination of a power-shaft, a revoluble head, cutter-spindles carried by said head, grooved arbors slidably fitted in the head, geared to the power-shaft and the cutter-spindles, and adapted to be independently withdrawn from engagement with said spindles and power-shaft, and locking-rods engaging with said grooved arbors, as and for the purposes described.

9. The combination of a power-shaft, a rotatable head, cutter-spindles carried by said head, a slidable arbor having a gear adapted to mesh directly with the power-shaft and one of the spindles, a counter-shaft geared to the other spindle, another slidable arbor having a gear which meshes with the power-shaft and the counter-shaft, and means for locking either arbor in its adjusted position, as and for the purposes described.

602,292. MINT-HARVESTER. OREN B. ABBEY, Dailey, Mich., assignor to Albert M. Todd, Kalamazoo, Mich. Filed May 28, 1896. Serial No. 593,286. (No model.)

Claim.—1. In a mint-harvesting implement, the combination of rectangular frames one of which is slightly larger than the other, the sides A, of which are pivoted together at *i*, *i*, so that the bottom bars C, C, will fold one above the other with the top bars B, B, secured on opposite sides of the side pieces A, A, to form convenient handles for operating the implement as specified.

2. In a mint-harvesting machine the combination of two rectangular frames the sides of which are pivoted the one to the other so that they will open and close like a pair of shears so that the bottom bars can be used for grasping plants and the top bars can be used as convenient handles for operating the same as specified.

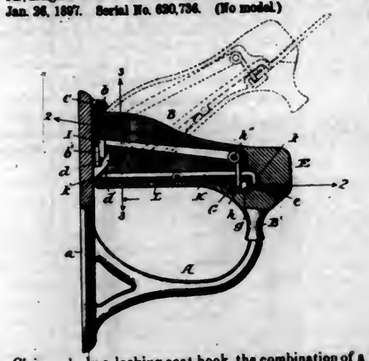
602,293. METHOD OF PATCHING SAWS. MICHAEL D. AHEARN, Green Bay, Wis. Filed July 8, 1897. Serial No. 643,893. (No specimens.)

Claim.—The method of repairing fractures in metal plates, consisting in cutting away the metal of the plate on one side of the same directly across the line of the fracture to form a lateral recess and reduce the edges of the fracture to a feather's edge, then inlaying and brazing a corresponding splice-piece within this recess and across the fracture, substantially as and for the purpose described.

602,294. FOOT-BALL. BENJAMIN ARNOLD, East Greenwich, R. I. Filed Oct. 8, 1897. Serial No. 654,502. (No model.)

Claim.—In a foot-ball or like body, a partition placed across from side to side in the ball and attached thereto at its edges, to form a chamber the outer wall of which will be flexible and easily depressed, a valve in the outer wall of said chamber opening into it, a valve in the inner wall of the chamber opening into the ball, a spring to press the outer and the inner walls apart, substantially as described.

602,295. TREATING SOLUTIONS OR ORES CONTAINING ZINC FOR RECOVERING ZINC AS OXIDE. EDGAR A. ASHCROFT, Newcastle, New South Wales. Filed Sept. 4, 1896. Serial No. 604,865. (No specimens.)



Claim.—1. The herein-described process for the treatment of ores

or solutions containing zinc, which consists in (*a*) obtaining from the zinc-bearing ore or solution solutions of zinc sulfate; (*b*) adding zinc oxid and stirring the mixture until a pasty consistency is obtained; and (*c*) heating the resulting product for the purpose of converting it into zinc oxid, sulfuric or sulfurous acid gas being disengaged; all substantially as described, and for the purposes specified.

2. The herein-described process for the treatment of ores or solutions containing zinc consisting in (*a*) obtaining solutions of zinc sulfate, (*b*) adding zinc oxid and stirring the mixture until a pasty consistency is obtained, (*c*) treating the resulting product for the production of zinc oxid, by first intimately mixing with it carbon (preferably as powdered charcoal) and finally heating the mixture at a uniform temperature for the purpose of converting it into zinc oxid, sulfuric or sulfurous acid gas being disengaged all substantially as described, and for the purposes specified.

3. The herein-described process of treating neutral zinc solutions for the production of zinc oxid, which consists in first converting the neutral zinc salt into basic zinc salt by the addition of zinc oxid, and then intimately mixing with said basic zinc salt, carbon in approximately the proportion of one-twentieth of the weight of the zinc to be recovered, and heating the mixture to a temperature approximating the melting-point of aluminium, substantially as specified.

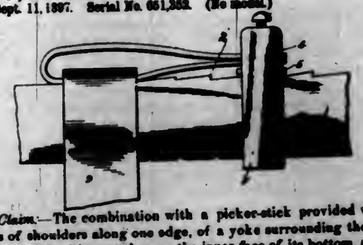
602,296. LOCKING COAT-HOOK. JOHN C. BACKUS, Smethport, Pa., assignor of one-third to William H. Hungerford, same place. Filed Jan. 26, 1897. Serial No. 620,736. (No model.)

Claim.—1. In a locking coat hook, the combination of a stationary hook, a movable member adapted to close upon the hook at its forward end, so as to confine an article which may be placed between them, a lock which holds the said parts in their closed positions, the said lock engaging with a stationary part of the device in rear of its front or hook part, and a casing surrounding the lock and being arranged above the hook and extending outward substantially as far as its end, and having the opening for the key in its front end, whereby the articles supported by the hook do not hang over, or in front of, the key-opening of the lock, substantially as set forth.

2. The combination of the hook, a movable member adapted to close upon the hook, a push-key lock for holding the hook and the movable member in their closed positions, and a case in which the lock is arranged, extending outward to the end of the hook, the case having an opening for the key at its front end, substantially as set forth.

3. The combination with a hook and its supporting-plate, of a projection extending outward from the plate, a case hinged to the plate, formed with an opening through its rear end through which the said projection enters the case when the latter is moved into engagement with the hook, and with a key-opening in its opposite or forward end, and a lock within the case adapted to engage with the said projection when it enters the case, in order to hold the case in engagement with the hook, and arranged to be operated by a key inserted through the opening in the front end of the case, substantially as set forth.

4. In a lock for a clothes-hook, the inclosing case, a block arranged therein and formed with a number of slots, a key having pins corresponding in arrangement to the slots in the said block, a locking-catch, and a lever carrying the said catch and provided with an arm which extends into one of the slots of the said block, whereby it is operated by the key, substantially as set forth.



5. In a lock for a clothes-hook, the inclosing case, a slotted block arranged therein, a key having pins corresponding in arrangement to the slots in the said block, a locking-catch, a lever carrying the catch and provided with an arm which extends into one of the slots of the said block, a retaining device for holding the key when inserted in the lock, and means for operating the said retaining device to hold the key when the lock is open, and for releasing the key when the lock is closed, substantially as set forth.

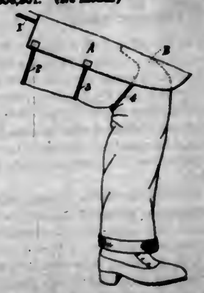
6. The combination with a hook, of a swinging case B, a stationary projection D arranged adjacent to the hook and adapted to enter the case when it is brought into the closing position, and a lock within the case comprising a catch-plate I adapted to engage with the said projection when the case is moved into locking position, and a lever carrying the said catch-plate and arranged to be operated by a key, substantially as set forth.

7. The combination of the swinging case B, a stationary projection D, adapted to enter the case when the latter is moved into a certain position, a locking-plate adapted to engage with the said projection, a lever carrying the said locking-plate, adapted to be operated by a key, and a lever K adapted to retain the key within the lock, this lever being so arranged as to engage with the said projection and be operated thereby to release the key whenever the parts are brought into position to have the catch-plate engage with the said projection, substantially as set forth.

8. In combination with a hook, a case B pivoted adjacent thereto, a spring which tends to move the case away from the hook, a stationary projection D adapted to enter the case when the latter is moved into engagement with the hook, a slotted block G arranged within the case opposite a key-opening, a lever H having an arm A extending into one of the slots of the said block, a catch-plate I carried by the other arm of the said lever, a key having pins corresponding in position to the slots in the said block, and the lever K for retaining the key in the case when the latter is moved away from the hook, the levers H and K being arranged within the case, substantially as set forth.

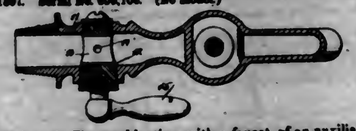
602,297. PICKER-STICK. JOSEPH BUSHA, Lisbon, Mo. Filed Sept. 11, 1897. Serial No. 651,252. (No model.)

Claim.—The combination with a picker-stick provided with a series of shoulders along one edge, of a yoke surrounding the stick and provided with a tooth upon the inner face of its bottom, a compression-plate movable within the yoke, a loop retained between the compression-plate and the upper end of the yoke, and a set-screw designed to retain the loop ends and to actuate the compression-plate to retain the latter in engagement with the shoulders upon the picker-stick, substantially as specified.



602,298. GEARING. ANDREW F. BEETLER, Doylestown, Pa. Filed Apr. 30, 1896. Serial No. 589,734. (No model.)

Claim.—1. In a gearing, the combination of the drive-wheel having the flange in the middle of its periphery and the pairs of teeth on opposite sides of the said flange, a wheel to be driven having seats in its periphery, and a sprocket-chain taking around and connecting the said wheels and having links respectively comprising the parallel members of right-angle form having the inner arms, the outwardly-directed arms and the transverse bolt connecting the outwardly-directed arms and also having the reduced and apertured portions at the outer ends of the inner arms and the kerfed and apertured portion at the inner ends of the inner arms and pintles flexibly connecting the reduced portions of one link in the kerfs of the next link throughout the chain, substantially as specified.

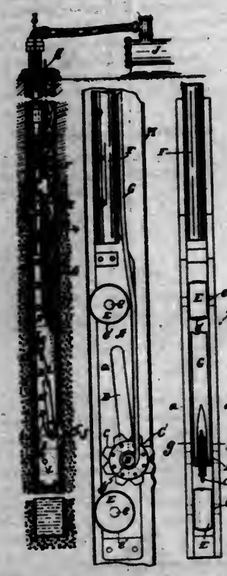


2. In a gearing, the combination of the drive-wheel having the flange in the middle of its periphery and also having peripheral teeth on opposite sides of the flange, a wheel to be driven having seats in its periphery, and the sprocket-chain taking around and connecting the said wheels and having flexibly-connected links respectively comprising the parallel members of right-angle form having the inner arms adapted to be engaged at their rear ends by the peripheral teeth of the drive-wheel and the arms extending outwardly from the forward ends of the inner arms and the transverse bolt connecting the outwardly-directed arms, substantially as and for the purpose set forth.

602,299. ATTACHMENT FOR OVERALLS, LEGGINGS, TROUSERS, &c. GILBERT C. BLAKE, Windsor, England. Filed Oct. 22, 1897. Serial No. 656,201. (No model.)

Claim.—An attachment for overalls, leggings, trousers and like coverings for the legs, consisting of a piece of flexible waterproof fabric or material, a stiffened outer end thereto adapted to project beyond the knee when the latter is bent, and means for attaching said piece to the article to be protected, as and for the purpose set forth.

602,300. FAUCET. CEPHAS W. BRACKETT, Jordan, N. Y., assignor to himself and Stephen L. Rockwell, same place. Filed Nov. 19, 1897. Serial No. 658,108. (No model.)



Claim.—1. The combination, with a faucet, of an auxiliary faucet located at the receiving end of the main faucet, the key of the auxiliary faucet being provided with a main opening and auxiliary openings arranged at an angle to the main opening, and removable plugs for the auxiliary openings, substantially as described.

2. The combination, with a faucet, of an auxiliary faucet located at the receiving end of the main faucet, the key of the auxiliary faucet being provided with openings at angles to one another, one of the openings being larger than the other, for the purpose set forth.

3. The combination, with a faucet, of a stop-cock connected therewith, the key of the stop-cock being provided with openings at angles to one another, one of the openings being of such size as to permit the liquid to flow through the key without material interruption, the other opening being tapering, its contracted end facing the source of liquid-supply, as set forth.

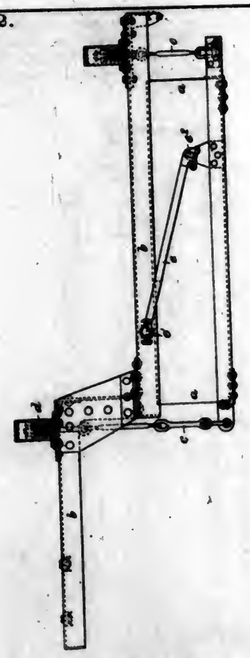
602,301. PIPE SLITTER AND PERFORATOR. ANDREW J. BRADLEYTT, Downey, Cal. Filed July 1, 1896. Serial No. 597,734. (No model.)

Claim.—1. The machine for slitting or perforating the tubes of bored or driven wells comprising a stock provided with an oblique guideway for the axle of a rolling cutter; a rolling cutter provided with an axle mounted in said guideway, the cutter being of such diameter that when the axle is in one portion of the guideway, the outer edge of the cutter will project beyond the edge of the stock; antifriction-rollers journaled in the stock and projecting from that edge thereof which is opposite the edge from which the cutter projects; means for forcing water into the well-tube under pressure; means for raising and lowering the stock; and means for moving the cutter-axle along the guideway.

2. The machine for slitting or perforating the tubes of bored or driven wells comprising a stock provided with an oblique guideway for the axle of a rolling cutter; a rolling cutter provided with an axle mounted in said guideway; the cutter being of such diameter that when the axle is in one portion of the guideway, the outer edge of the cutter will project beyond the edge of the stock; antifriction-rollers journaled in the stock and projecting from the edge thereof which is opposite the edge from which the cutter projects; a pipe fastened to the stock to carry the same and arranged to discharge water into the space around the cutter; means for forcing water through the pipe; means for raising and lowering the pipe and stock; and means for moving the cutter-axle along the guideway.

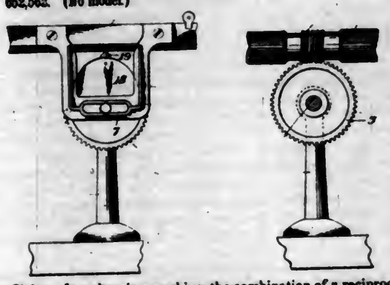
3. The stock with oblique guideway and with antifriction-rollers journaled in the stock and projecting at one edge of the shank, the rolling cutter with axle in the oblique guideway, and adapted to project from that edge of the stock opposite the antifriction-rollers, and means independent of the stock for moving the axle along the guideway.

4. In a pipe slitter or perforator, the combination of two plates, each provided with an oblique slot and being fastened to each other, with an open space between them; two antifriction-rollers between the plates and journaled in the plates and projecting beyond one edge thereof; a rolling cutter arranged between the plates and having an axle journaled in the oblique slots in the plates; and the handle journaled to the axle between the cutter and the plates for moving the axle along the slots.



5. The sectional rolling cutter comprising two plates the inner faces of which are flat; pointed segmental sections between the plates arranged with their edges fitted together to support each other, the several segments forming a circle between said plates; an axle extending through the plates and projecting on each side thereof; and means for fastening the plates and pointed segmental sections together.

602,302. SUSPENDING BATTERIES ON CARRIAGES. REGINALD T. D. BROUGHAM and WALTER C. BENNETT, London, England, assignors to the Electrical Vehicle Syndicate, Limited, same place. Filed Dec. 13, 1897. Serial No. 661,735. (No model.)



Claim.—1. The combination of the carriage-frame, a box, springs supporting the box from the frame and a rod pivoted at one end to the frame and at the other to the box.

2. The combination of the carriage-frame, springs supported by the frame, links supported by the springs, a box hung on the links and a rod pivoted at one end to the frame and at the other to the box.

602,802.

602,803. HEART-MOTION FOR SPINNING-MACHINES. GEORGE W. CRADWICK, Chester, Pa. Filed Sept. 22, 1897. Serial No. 652,562. (No model.)

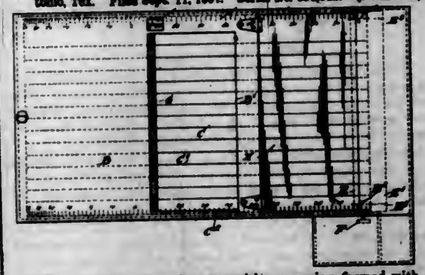
Claim.—In a drawing-machine, the combination of a reciprocating roving rod or guide provided with a bracket having two pins, a heart-cam provided with a spring-pressed plunger adapted to engage said pins, and means for actuating said cam, substantially as described.

602,804. FILTER. CHARLES R. CHAMBERLAND, Paris, France. Filed Aug. 30, 1892. Serial No. 444,549. (No model.) Patented in France Sept. 13, 1890, No. 208,236.

Claim.—1. In a filter, the combination with the flexible collector having extended necks as described, of a series of filtering-tubes adapted to be connected into said necks, said collector being adapted to be connected through the walls of a retaining-receptacle to a discharge tube which is extended below the bottom of said filtering-tubes, substantially as specified.

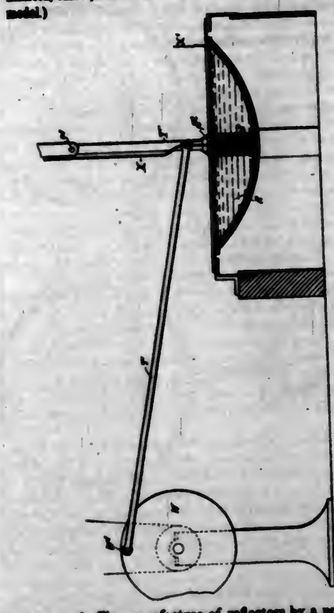
2. The combination with an outer casing, an inner receptacle or filtering-chamber supported within and in the upper part of said outer casing so as to form a reservoir in the lower part of said casing and below said inner receptacle, a series of filtering-tubes within said filtering-chamber, a discharge-pipe extending through the walls of said filtering-chamber, and a connection from said discharge-pipe to a collector with which said filtering-tubes are connected, said discharge-pipe being adapted to discharge into the reservoir in the bottom of said casing, substantially as specified.

3. In a filter, the combination with a retaining-receptacle, and one or more filtering-tubes arranged therein, of a flexible connection extending from the top of said filtering tube or tubes to a stationary discharge-opening adapted to form a communication through the walls of said receptacle, and a discharge-tube connected to the stationary connection on the outside of said receptacle, said discharge-tube being extended below the bottom of said tubes, substantially as specified.



4. In a filter, the combination with a flexible collector having extended necks, as described, a series of filtering-tubes adapted to be connected into said necks, a stationary two-part connection arranged in a perforation in the walls of a retaining-receptacle in which said filtering-tubes are adapted to be placed, said two-part connection having a nipple to which said collector may be attached, and a flexible tube connected to said two-part connection on the outside of said receptacle and extended below the bottom of said filtering-tubes, substantially as specified.

5. In a filter, the combination with a suitable retaining-receptacle, of a series of filtering-tubes arranged therein, a collector having a series of openings one for each tube, flexible slip connections in each of said openings to which said tubes are adapted to be removably attached, and a discharge-pipe from said collector, said discharge-pipe being projected through the walls of said retaining-receptacle and extended below the bottom of said filtering-tubes, substantially as specified.



6. In a filter, the combination with an outer casing having an upper retaining-receptacle, and a lower reservoir therein, a series of filtering-tubes in said retaining-receptacle, and a collector having a series of openings one for each tube, a flexible rubber connection in each of said openings to which one of said tubes is removably attached, a discharge-tube from said collector, said discharge-tube being extended through the walls of said retaining-receptacle and into said reservoir, substantially as specified.

602,805. TIME-RECORDER. FREDERICK W. COOK, Jr., San Antonio, Tex. Filed Sept. 11, 1897. Serial No. 651,312. (No model.)

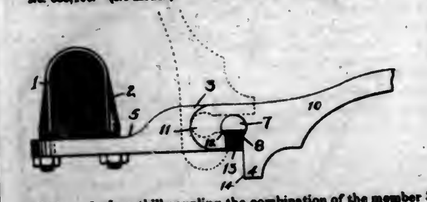
Claim.—A time-recorder, comprising a casing formed with an opening and a slot, a fixed table extending under the said opening, a pair of clock-actuated drawing-rollers journaled in the casing for drawing a sheet of paper over the said table at the casing-opening to permit of writing in a longitudinal direction on the sheet, the latter being provided with a longitudinally-extending graduation indicating hours and subdivisions in minutes, and arranged to appear in the said slot, the said drawing-rollers imparting motion to the sheet in such a manner that the sheet passes a fixed point a distance between two graduation-marks during the interval of one minute, the sheet being also provided with spaced lines for receiving the signatures of the persons at the time indicated by the graduation at the said slot, the lines extending in the direction of the movement of the sheet, and a transfer-strip extending transversely over the sheet at the said opening above the said table and across the said lines, to admit of transferring a mark onto the paper alongside of the corresponding signature, substantially as shown and described.

602,806. MANUFACTURE OF REFLECTORS. SHERARD O. COWPER-COLES, London, England, assignor to the Reflector Syndicate, Limited, same place. Filed June 10, 1897. Serial No. 640,189. (No model.)

Claim.—1. The manufacture of reflectors by a process of deposition consisting in applying to a prepared mold a coating of silver or other suitable metal, then depositing thereon electrically a backing of a common or base metal, and then separating the reflector from the mold by heating the same in a water-bath, substantially as described.

2. The manufacture of reflectors by a process of deposition consisting in applying to a prepared mold a coating of silver, then depositing thereon electrically a backing of a common or base metal, then separating the reflector from the mold by heating the same in a water-bath and lastly applying a film of a non-tarnishable metal to the surface of the reflector to prevent tarnishing thereof, substantially as described.

3. The manufacture of a reflector consisting in coating the convex surface of a suitably shaped and polished glass mold with silver, then depositing electrically on the silver a backing of copper of the required thickness, then separating the reflector from the mold by heating the same in a water-bath, and finally covering the reflecting-surface with a film of palladium to prevent tarnishing thereof, substantially as described.



4. The manufacture of a reflector consisting in coating the convex surfaces of a suitably shaped and polished glass mold with silver, then depositing electrically on the silver a backing of a base metal, then applying a stopping-off ring to determine the diameter of the reflector and then continuing the deposition of the base metal until the required thickness has been attained, then separating the reflector from the mold by heating the same in a water-bath, then coating the reflecting-surface with a film of a suitable non-tarnishable metal, and finally trimming the edge of the reflector, substantially as described.

5. In means for the manufacture of reflectors by a process of deposition, the combination with a tank containing an electrolyte, of a glass mold having a metallic coating and having a beveled edge, a ring for carrying the mold, a stopping-off ring to determine the diameter of the reflector and to insure a clear edge thereto, means for suspending and rotating the mold in said electrolyte during the deposition of the metal backing, an anode in said tank, and electrical conductors leading to the metal coating on the mold and to said anode, substantially as described.

6. The combination of a tank containing an electrolyte of a glass mold having a metallic coating, a supporting-ring therefor, a stopping-off ring to determine the diameter of the reflector and to insure a clean edge thereto, a rotary shaft for suspending and rotating the mold in said electrolyte, a joint in the said shaft to admit of tilting the mold when first lowering it into the electrolyte, an anode in said tank and electrical conductors leading to the metal coating on the mold and to the anode in the tank, substantially as described.

7. For coating the reflector with a non-tarnishable metal, the combination of a pan for receiving the reflector and a solution of the metal to be deposited, an anode suspended in the electrolyte from a hinge so as to be capable of swinging, means for swinging the anode, and electrical conductors leading to the anode and to the reflector, substantially as described.

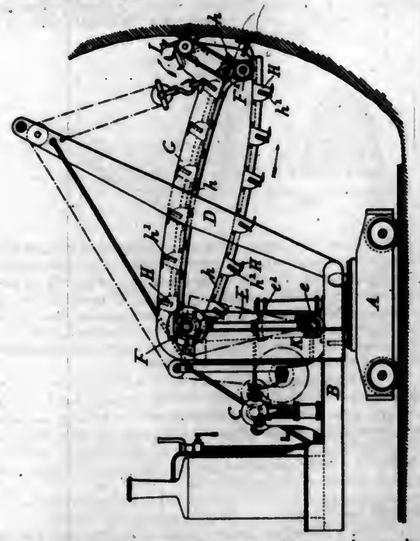
602,807. THILL-COUPLING. ALBERT L. CRANDALL, Rochester, N. Y., assignor to Jesse S. Lee, same place. Filed Apr. 21, 1897. Serial No. 633,166. (No model.)

Claim.—1. In a thill-coupling the combination of the member 3 having the laterally-extending segmental lugs 7 on the sides thereof, with upper portions rounded to afford bearings and their lower sides flattened at 6, and the cooperating member 10 provided with the projecting arms 11 adapted to extend upon opposite sides of the member 3, and having the circular apertures to engage the pins, open on the lower sides, said openings being narrower than the greatest widths of the lugs; substantially as described.

2. In a thill-coupling, the combination with the member 3 having the portion 5 for engaging the axle and the segmental lugs 7 with the rounded upper sides to afford bearings and the cut-away portion 8 upon their lower sides, of the member 10 having the projecting arms 11 adapted to extend on opposite sides of the member 3, said arms having the circular apertures to engage the lugs, and slots or openings 13 extending from the lower sides of said apertures, the clip 2 for attaching the member 8 to the axle and the spring, as 15, arranged between the members.

3. In a thill-coupling the combination with the member 3 having the laterally-extending segmental lugs 7 on opposite sides with their upper surfaces rounded to afford bearings and their lower sides flattened, of the member 10 having the projecting arms 11 adapted to extend on opposite sides of the member 3, said arms having the circular apertures to engage the lugs and slots or openings 13 extending from the lower sides of the arms and a foot 4 on the member 10, formed with its face in line with the forward edge of the slot and projecting below the lugs 7 when the parts are engaged, and a spring as 15, interposed between the two members and held in one of them; substantially as described

602,808. SAFETY-AXLE. THOMAS H. CROOK, York, Pa. Filed July 13, 1897. Serial No. 644,435. (No model.)



Claim.—1. An axle for vehicles, comprising an intermediate section, end sections pivoted to the intermediate section and forming the spindles, and springs secured to the intermediate section to bear against the end sections; together with projections on the body of the vehicle, substantially as shown and for the purpose set forth.

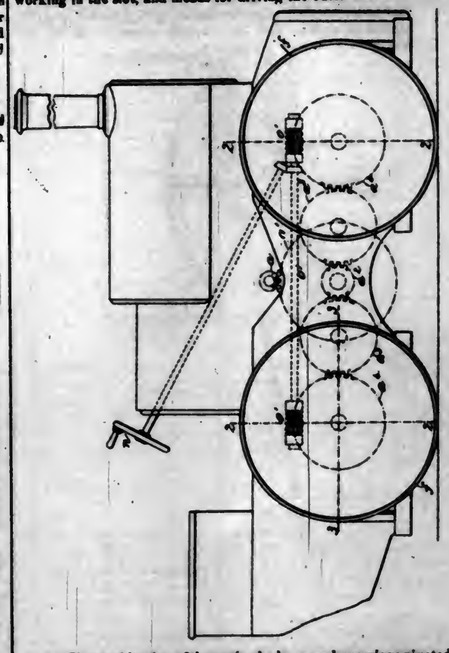
2. In an axle for vehicles, the combination with an intermediate section formed at its ends into sockets open at one side, spindle-sections pivoted within the sockets to swing laterally with respect to the main section, plate-springs attached to the main section and bearing at their free ends against the spindle-sections to hold them normally on a line with said main section, and projections on the body of the vehicle positioned to engage the spindle sections, substantially as shown and for the purpose set forth.

3. In an axle for vehicles, the combination with a central or main section, sockets formed at the ends thereof, said sockets being open at one side and the top and bottom plates extended vertically, spindle-sections pivoted within the sockets to have a lateral movement with respect to the main section of the axle, plate-springs secured to the axle by the thill-clips and bearing at their free ends upon the spindle-sections; together with a cross-bar attached to the under side of the body of the vehicle and presenting projections arranged to engage the pivoted spindle-sections, substantially as shown and for the purpose set forth.

602,309. EXCAVATING MACHINERY. ARTHUR CAYER and EDGAR C. NEWBY, Cardiff, England. Filed Sept. 29, 1896. Serial No. 607,230. (No model.)

Claim.—1. An excavating-machine comprising a truck, a revolving base-frame thereon carrying boiler, engine, hoisting and crane gear, a pivoted upright frame and a jib, a boom having its one end pivoted to the upright frame and its other end suspended from the jib, a chain of dredging-buckets and a set of revolving picks carried by the boom, all arranged and operating substantially as described.

2. In combination with the dredging-buckets H, the trays A and scrapers *k'* substantially as and for the purpose set forth.



602,310. LOCOMOTIVE. BRAHAM J. DIPLOCK, London, England. Filed Dec. 20, 1897. Serial No. 662,619. (No model.) Patented in England Oct. 19, 1896, No. 19,682.

Claim.—1. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, springs between the axles and undercarriage, a wheel at the center of the undercarriage, a universal joint connecting the central wheel to the axles, a lost-motion pinion at approximately the same level as the central wheel, and means for driving the central wheel from the lost-motion pinion.

2. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, springs between the axles and undercarriage, a wheel at the center of the undercarriage, a universal joint connecting the central wheel to the axle, a lost-motion pinion at approximately the same level as the central wheel, means for driving the central wheel from the lost-motion pinion, and buffers carried by the axle-boxes and bearing against the undercarriage.

3. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, springs between the axles and undercarriage, a wheel at the center of the undercarriage, a universal joint connecting the central wheel to the axle, a lost-motion pinion at approximately the same level as the central wheel, means for driving the central wheel from the lost-motion pinion, and spring-buffers pivoted to the axle-boxes and bearing against the undercarriages.

4. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to the wheels, springs between the axle and the undercarriage, a wheel spherical on its outside fixed to the center of the axle, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, and means for driving the outer wheel.

5. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, a beveled pinion fixed to each axle, springs between the axles and undercarriage, a wheel spherical on its outside free to turn on the axles, beveled pinions pivoted to the wheel and gearing with the pinions on the axles, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, and means for driving the outer wheel.

6. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to the wheels, springs between the axle and the undercarriage, a wheel spherical on its outside fixed to the center of the axle, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, means for driving the outer wheel, and buffers carried by the axle-boxes and bearing against the undercarriage.

7. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, a beveled pinion fixed to each axle, springs between the axles and undercarriage, a wheel spherical on its outside free to turn on the axles, beveled pinions pivoted to the wheel and gearing with the pinions on the axles, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, means for driving the outer wheel, and buffers carried by the axle-boxes and bearing against the undercarriage.

8. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to the wheels, springs between the axle and the undercarriage, a wheel spherical on its outside fixed to the center of the axle, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, means for driving the outer wheel, and spring-buffers pivoted to the axle-boxes and bearing against the undercarriage.

9. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, a beveled pinion fixed to each axle, springs between the axles and undercarriage, a wheel spherical on its outside free to turn on the axles, beveled pinions pivoted to the wheel and gearing with the pinions on the axles, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and buffers carried by the axle-boxes and bearing against the undercarriage.

10. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to the wheels, springs between the axle and the undercarriage, a wheel spherical on its outside fixed to the center of the axle, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, guides pivoted to the undercarriage and embracing the outer wheel, and means for driving the outer wheel.

11. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, a beveled pinion fixed to each axle, springs between the axles and undercarriage, a wheel spherical on its outside free to turn on the axles, beveled pinions pivoted to the wheel and gearing with the pinions on the axles, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, guides pivoted to the undercarriage and embracing the outer wheel, and means for driving the outer wheel.

12. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to the wheels, springs between the axle and the undercarriage, a wheel spherical on its outside fixed to the center of the axle, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and buffers carried by the axle-boxes and bearing against the undercarriage.

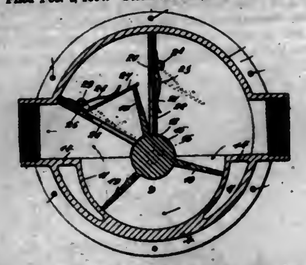
13. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, a beveled pinion fixed to each axle, springs between the axles and undercarriage, a wheel spherical on its outside free to turn on the axles, beveled pinions pivoted to the wheel and gearing with the pinions on the axles, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and buffers carried by the axle-boxes and bearing against the undercarriage.

14. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to the wheels, springs between the axle and the undercarriage, a wheel spherical on its outside fixed to the center of the axle, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and spring-buffers pivoted to the axle-boxes and bearing against the undercarriage.

15. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, a beveled pinion fixed to each axle, springs between the axles and undercarriage, a wheel spherical on its outside free to turn on the axles, beveled pinions pivoted to the wheel and gearing with the pinions on the axles, a wheel spherical on the inside and mounted on the other, a parallel-sided slot in one wheel, a rectangular head pivoted to the other and working in the slot, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and spring-buffers pivoted to the axle-boxes and bearing against the undercarriage.

16. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to the wheels, springs between the axle and the undercarriage, a wheel spherical on its outside fixed to the center of the axle, a wheel spherical on the inside and mounted on the other, means for driving the inner wheel from the outer wheel, guides pivoted to the undercarriage and embracing the outer wheel, and means for driving the outer wheel.

17. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, a beveled pinion fixed to each axle, springs between the axles and undercarriage, a wheel spherical on its outside free to turn on the axles, beveled pinions pivoted to the wheel and gearing with the pinions on the axles, a wheel spherical on the inside and mounted on the other, means for driving the inner wheel from the outer wheel, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and spring-buffers pivoted to the axle-boxes and bearing against the undercarriage.



18. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to the wheels, springs between the axle and the undercarriage, a wheel spherical on its outside fixed to the center of the axle, a wheel spherical on the inside and mounted on the other, means for driving the inner wheel from the outer wheel, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and buffers carried by the axle-boxes and bearing against the undercarriage.

19. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, a beveled pinion fixed to each axle, springs between the axles and undercarriage, a wheel spherical on its outside free to turn on the axles, beveled pinions pivoted to the wheel and gearing with the pinions on the axles, a wheel spherical on the inside and mounted on the other, means for driving the inner wheel from the outer wheel, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and buffers carried by the axle-boxes and bearing against the undercarriage.

20. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to the wheels, springs between the axle and the undercarriage, a wheel spherical on its outside fixed to the center of the axle, a wheel spherical on the inside and mounted on the other, means for driving the inner wheel from the outer wheel, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and spring-buffers pivoted to the axle-boxes and bearing against the undercarriage.

21. The combination of the engine-body, an undercarriage pivoted to the body, a pair of wheels supporting the undercarriage, an axle fixed to each wheel, a beveled pinion fixed to each axle, springs between the axles and undercarriage, a wheel spherical on its outside free to turn on the axles, beveled pinions pivoted to the wheel and gearing with the pinions on the axles, a wheel spherical on the inside and mounted on the other, means for driving the inner wheel from the outer wheel, guides pivoted to the undercarriage and embracing the outer wheel, means for driving the outer wheel, and spring-buffers pivoted to the axle-boxes and bearing against the undercarriage.

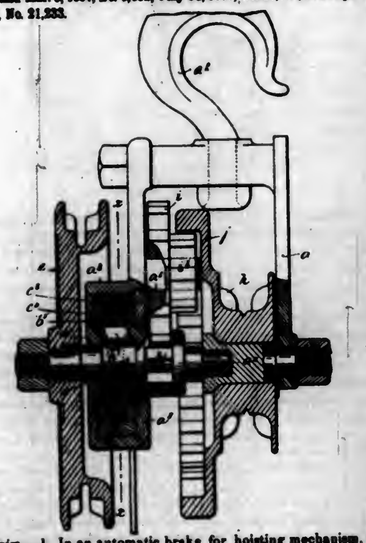
602,311. FLUID METER OR MOTOR. JOHN H. DIXON, Marietta, Ohio. Filed Feb. 4, 1897. Serial No. 622,017. (No model.)

Claim.—1. A fluid meter or motor having a circular casing, the lower portions of the sides of which are provided with curved interior walls joined to horizontally-extending walls, forming a semicircular cavity eccentric to the circle of the casing, two semicircular plates respectively lying against the heads of the casing and at the inner sides thereof, each plate having an upwardly-extending lug at its middle portion, a drum located between the upwardly-extending lugs and having trunnions respectively mounted therein, blades secured to the drum and projecting radially therefrom, the blades being movable through the semicircular cavity of the casing, a partition radially extending upwardly from the drum and dividing the casing into two compartments, and a spring-pressed valve-plate closing an opening in the partition and permitting the passage of the blades through the opening when the blades move in one direction, substantially as described.

2. A device of the class described having a casing with circular sides, a head at one end of the casing, a head at the other end of the casing, the said second head having a dish-shaped portion projecting into the casing, a radial apertured partition in the casing, a spring-pressed valve for closing the opening in the partition, a series of blades turning with each other and mounted within the casing to be actuated by the fluid, said blades passing through the apertures of the partition and a motor in connection with the blades and located within the dish-shaped portion of the said second head, substantially as described.

3. A fluid meter or motor having a cylindrical casing, a drum mounted within the casing, a series of radial blades carried by the

drum, a partition running radially between the sides of the casing and the drum and having an orifice adjacent to the drum and through which the blades pass as they move with the drum, and a spring-pressed valve-plate normally closing the orifice, the casing having inlet and outlet openings respectively on opposite sides of the partition, substantially as described.



4. A fluid meter or motor having a cylindrical casing with inlet and outlet orifices, a shaft mounted within the casing, a series of blades carried by the shaft, a partition extending radially between the shaft and the sides of the casing and having an orifice therein adjacent to the shaft and through which the blades pass as they move with the shaft, and a spring-pressed valve-plate normally closing said orifice, substantially as described.

5. A fluid meter or motor having a circular casing with inlet and outlet orifices, a shaft revolubly mounted within the casing and held eccentrically therein, a series of blades carried by the shaft, a partition located within the casing and having an orifice adjacent to the shaft and through which the blades pass as they move with the shaft, and a spring pressed valve-plate normally closing the orifice of the partition, substantially as described.

6. A fluid meter or motor having a cylindrical casing having an inlet and outlet on opposite sides, a shaft eccentrically and revolubly mounted within the casing, a series of blades carried by the shaft, a vertical partition running between the shaft and the inner side of the casing and located in the half of the casing having the longest radius from the shaft, a diagonal partition extending inwardly from the upper side of the outlet, the partitions having openings through which the blades pass, and valve-plates normally closing said openings, substantially as described.

7. A fluid meter or motor having a circular casing the lower portions of the sides of which have two curved walls forming a true semicircle, and having horizontal continuations at their upper ends at the inlet and outlet of the casing, a shaft mounted within the casing, a series of blades carried by the shaft and fitting snugly within and movable through said semicircle formed by the walls, and a partition extending radially between the shaft and the casing and located above the curved walls, the partition having an orifice through which the blades pass, and a spring-pressed plate normally closing the orifice, substantially as described.

602,812. LOAD-SUSTAINER FOR WEIGHT-LIFTERS. WILLIAM T. EADES, Birmingham, and THOMAS MATTHEWS, Leamington, England. Filed Oct. 11, 1897. Serial No. 654,872. (No model.) Patented in England Mar. 8, 1897, No. 6,032, July 31, 1897, No. 17,948, and Sept. 16, 1897, No. 21,233.

Claim.—1. In an automatic brake for hoisting mechanism, the combination with the load-wheel, of a shaft arranged in the same axial line with said wheel and having fixed thereon a hand-wheel, a fixed box-casing arranged between the hand-wheel and load-wheel, two friction-disks loosely arranged about said shaft within said box, said disks having inclined adjacent faces and provided with inwardly-projecting lugs, a stud projecting between the lugs and arranged to revolve with the load-wheel, said stud operating when the load-wheel is revolved to separate the lugs and rotate the friction-disks one upon the other and thus force them into frictional contact with the inclosing box, and a stud arranged to be thrown into engagement with either of the said lugs to rotate the friction-disks one upon the other in the opposite direction and withdraw them out of contact with the box, substantially as described.

2. In an automatic brake for hoisting mechanism, the combination with the load-wheel, of a shaft arranged in the same axial line with said wheel and having fixed thereon a hand-wheel, a fixed box or casing arranged between the hand wheel and load-wheel, two friction-disks arranged loosely about the shaft within said box and having inclined adjacent faces, each of said disks being provided with an inwardly-projecting lug, a stud projecting between said lugs and arranged to revolve with the load-wheel, said stud operating to separate the lugs and turn the friction-disks one upon the other and thus force them into frictional contact with the inclosing box, and a stud projecting from the shaft and arranged to engage either of the said lugs when the hand-wheel is turned to turn the friction-disks in the opposite direction and withdraw them out of contact with the box, substantially as described.

3. In an automatic brake for hoisting mechanism, the combination with the load wheel, of a shaft arranged in the same axial line therewith and having fixed thereon a hand-wheel, a fixed box or casing arranged between the hand-wheel and load-wheel, two centrally-apertured friction-disks arranged about the shaft within the box and having inclined adjacent faces, said friction-disks normally rotating together and each provided with an inwardly-projecting lug, a pinion loosely journaled on the shaft and provided with a stud projecting between the said lugs, intermediate gearing driven by the load-wheel for driving said pinion, and a stud projecting from said shaft and arranged to engage either of said lugs by turning the hand-wheel, substantially as described and for the purpose specified.

602,818. HITCHING OR UNHITCHING DEVICE. WILLIAM S. ENDELOW, Jackson, Pa., assignor to Addie S. Endelow, Blain, Pa. Filed July 29, 1897. Serial No. 646,400. (No model.)

Claim.—1. A hitching and unhitching device adapted to be secured to the shaft or thill of a vehicle and comprising a body portion or casing having a recessed under surface, a stud or lug on said recessed portion, a latch pivoted in the recess and having a notched or slotted end, and a spring for engaging with said notch thus locking the latch when closed, substantially as described.

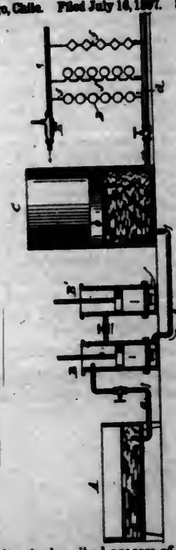
2. A hitching and unhitching device adapted to be secured to the shaft or thill of a vehicle, comprising a body portion or casing having a recessed under surface, undercut shoulders at each end thereof, studs or lugs on said recessed surface, latches pivoted thereto and having notched and rabbeted ends constructed to fit under said shoulders, and springs for engaging and releasing the shoulders, substantially as and for the purposes described.

3. A hitching and unhitching device adapted to be secured to the shaft or thill of a vehicle, comprising a body portion or casing having undercut shoulders at each end thereof, studs or lugs on said recessed surface, latches pivoted thereto, and adapted to swing laterally and formed with notches and rabbeted ends to fit under said shoulders and springs, with finger-pieces for engaging and releasing the latter, substantially as and for the purposes described.

4. A hitching and unhitching device adapted to be secured to the thill or shaft of a vehicle, comprising a body portion or casing having a recessed under surface, studs or lugs depending therefrom, swinging latches pivoted thereto, and a spring on top of said box or casing having its ends bent and passed through vertical slots in the body or casing forming finger-pieces for securing and releasing the latches, substantially as and for the purposes described.

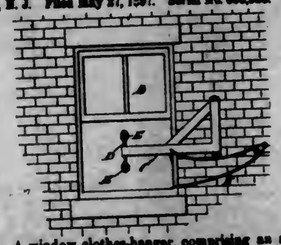
5. A hitching and unhitching device adapted to be secured to the thill or shaft of a vehicle comprising a body portion or casing having a recessed under surface, studs or lugs depending therefrom, swinging latches pivoted thereto and a spring on the top of said box or casing having its ends bent and passed through vertical slots in the body or casing, in combination with a tug or trace having a laterally-projecting loop, substantially as and for the purposes described.

6. A hitching and unhitching device adapted to be secured to the thill or shaft of a vehicle comprising a body portion or casing having a recessed under surface, studs or lugs depending therefrom, swinging latches pivoted thereto, and a spring on the top of said box or casing having its end bent and passed through vertical slots in the body or casing, in combination with a tug or trace having a laterally-projecting loop, and a loop in the plane of the trace for the back-strap, substantially as and for the purposes described.



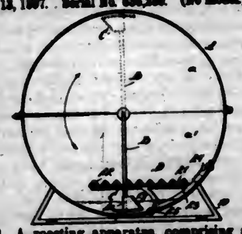
602,814. CHANGEABLE IMPLEMENT. CHARLES J. ERICSON, Salt Lake City, Utah. Filed June 9, 1897. Serial No. 639,909. (No model.)

Claim.—1. In a device of the character described, a stock-piece formed of sheet metal, having side pieces held together in parallel planes by an integral web, said sides having right-angular flanges disposed in the same plane, said sides terminating at one end in laterally-perforated ears, and one side having a pointed toe at the end opposite the ear, substantially as described.



2. A drawing and marking instrument having a blade-section and a stock-section, the blade-section having a longitudinal slot and the stock-section being formed of a sheet of pliable material with a longitudinally-extending slot therein and with a longitudinally-elongated channel on each side of the line of the slot, the said sheet being bent on the line of the slot so that the channels register, and the slotted portion of the blade being received between the portions of the stock, which portions are on each side of the slot therein, and a pivot run through the stock and through the slot of the blade.

602,815. PROCESS OF PRESERVING MILK. ARMILIO FERRANDES, Santiago, Chile. Filed July 16, 1897. Serial No. 644,786. (No specimens.)



Claim.—The herein-described process of preserving milk which consists, first, in submitting milk at normal temperature to reduced pressure for the removal of all gases therefrom; then introducing the purified milk at normal temperature, solely by means of a vacuum and without exposure to the atmosphere, into a series of connected air-exhausted cans; then hermetically sealing each can of said series of filled cans; then separating the series into individual cans, and finally subjecting the milk within the said sealed and separated cans to sterilization by heat alone, substantially as set forth.

602,816. WINDOW CLOTHES-HANGER. RICHARD B. FORDHAM, Rahway, N. J. Filed May 27, 1897. Serial No. 638,203. (No model.)

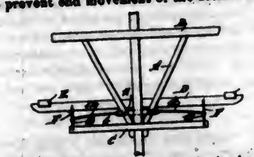
Claim.—A window clothes-hanger, comprising an arm pivoted upon vertical pivots to the wall at one side of the window and having pulleys attached by a flexible connection to its outer end, a pulley supported from the wall beyond the pivot of the arm, guy-ropes attached to the arm and extending one direct to the window and the other through said pulley and then to the window, a distant support having pulleys supported therefrom by an elastic connection which takes up the slack of the rope, and a clothes-line extending about a pulley upon the swinging arm and one upon the pole, substantially as described.

602,817. COOKING APPARATUS. GEORGE D. FOX, Buffalo, N. Y. Filed May 13, 1897. Serial No. 636,269. (No model.)

Claim.—1. A roasting apparatus, comprising a pan having a curved bottom, a platform of less length than the pan and secured to the bottom of the pan at one side of a central vertical section thereof, a crank-shaft consisting of a horizontal member extending from end to end of the pan and vertical end members having their upper ends terminating in trunnions journaled in bearings in the pan, one of said trunnions terminating in a handle, and a scoop secured to the horizontal member of the crank-shaft and extending the entire length thereof, substantially as described.

2. A roasting apparatus, consisting of two semicylindrical sections, the lower section being provided with a base, a gridiron of less length than the pan and secured to the bottom of the lower section at one side of a central vertical section thereof, a crank-shaft, consisting of a horizontal member extending from end to end of the lower section and vertical members having their upper ends terminating in trunnions journaled in bearings in the upper portion of said lower section, one of the trunnions terminating in a handle, and a scoop secured to the horizontal and end members of the crank-shaft, the said scoop projecting beyond opposite sides of the said horizontal member, substantially as herein shown and described.

602,818. BICYCLE-SUPPORT. HENRY GEHS, Baltimore, Md. Filed Apr. 13, 1897. Serial No. 631,935. (No model.)



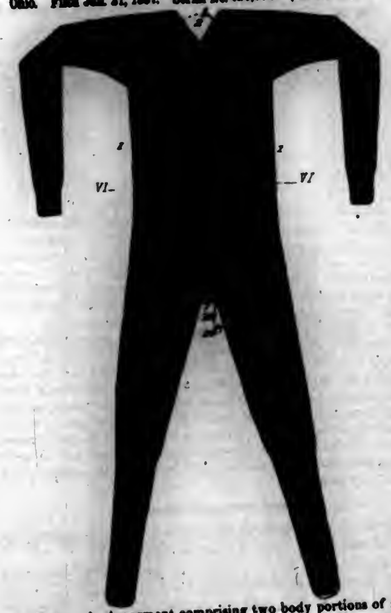
Claim.—1. In a bicycle-support, the U-shaped clip adapted to be connected to the upright frame bar and provided on its loop end with a perforated lug or ear, in combination with a rabbeted hanger having one end beveled and connected to said lug to stand in oblique relation thereto by an upright pivot, and a rod-support connected to said hanger by a transverse pivot to lie normally within the rabbeted hanger, substantially as described.

2. In a bicycle-support comprising a pointed rod, a U-shaped clip for connecting said rod to the rear brace of the bicycle, a hanger having a transverse perforation and one end beveled and pivoted to an ear on the loop end of the clip to stand in oblique relation thereto, the pointed rod having one end bent to form a transverse pivot engaging the hanger, and an elastic U-shaped clip secured to said rod near its swinging end to serve as a foot-rest for forcing the point of the rod into the surface on which it may rest, and also as a clip for engaging the rear brace when the rod is folded against it, substantially as described.

602,819. WAGON-BRAKE. JOSEPH A. GILKEY, Springfield, Oreg. Filed Aug. 2, 1897. Serial No. 646,906. (No model.)

Claim.—1. In a brake, a controlling-spring for the brake-bar, the said spring being longitudinally curved, concaved at its forward face and provided with hooks at its ends, adapted to receive the link connections between a brake-beam and its support, the said

spring normally holding the brake-beam away from the wheels and also serving to prevent end movement of the brake beam.



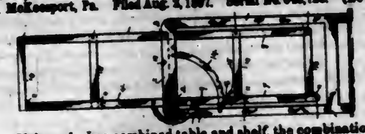
2. In a brake, a controlling-spring for the brake-beam, the said spring being longitudinally curved, its forward face being concaved and its ends terminating in hooks which extend at the front, the material of the spring being likewise bent upon itself to form upright side sections and a horizontal central section, for the purpose specified.

3. The combination, with the hounds of a vehicle, the brake-beam, the supporting-bar for the said brake-beam, and a connection between the brake-beam and supporting-bar, of a spring adapted to control the movement of the brake-beam and normally hold the said beam away from the wheels, the said spring being attached to the hounds and longitudinally curved, its concaved surface facing the front, the spring being further provided with hooks at its ends, facing the front, which hooks engage with the connections between the brake bar or beam and its support, as specified.

4. In a vehicle, the combination, with the running-gear, the brake-beam, the supporting-beam, and links connecting the brake-beam with the supporting-beam, of a spring adapted to control the movement of the brake-beam in a manner to hold it normally from engagement with the wheels of the vehicle, the said spring being longitudinally curved, its forward face being concave, the said material of the spring being bent upon itself to form a central horizontal surface and vertical side surfaces, and end hooks facing the front, the hooks being adapted to engage with the connecting medium between the brake-beam and its support, the horizontal surface of the spring being arranged for attachment to the running-gear at a point between the brake-beam and the support for the same.

5. In a brake, a controlling-spring for the brake-beam, the spring being longitudinally curved and its forward face being concaved, the material of the spring being bent upon itself to form upright side sections and a horizontal central section, the ends of the spring being constructed to engage the connections between the brake-beam and its support, as and for the purpose specified.

602,320. UNDERGARMENT. ISAAC GOLDBERGER, Cleveland, Ohio. Filed Jan. 21, 1897. Serial No. 620,064. (No model.)

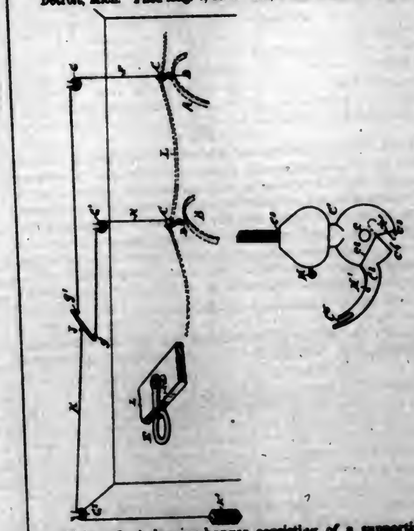


Claim.—1. A garment comprising two body portions of similar shape cut away on divergent lines at the front and also at the back to provide a neck-opening and overlapped flaps at the front and also at the back; substantially as described.

2. A garment comprising two folded body portions of similar shape cut away on divergent lines at the front and also at the back to provide a neck-opening and flaps overlapped at the front and flaps also overlapped at the back; substantially as described.

3. A combination or union suit having a longitudinal seat-opening at the crotch, and a pair of vertically-yielding lappets secured respectively at the ends of the seat-opening and each formed of a piece of knitted ribbed fabric folded transversely parallel with the ribs, substantially as described.

602,321. COMBINED SHELF AND TABLE. CHARLES O. HARLY, McKeesport, Pa. Filed Aug. 2, 1897. Serial No. 646,726. (No model.)



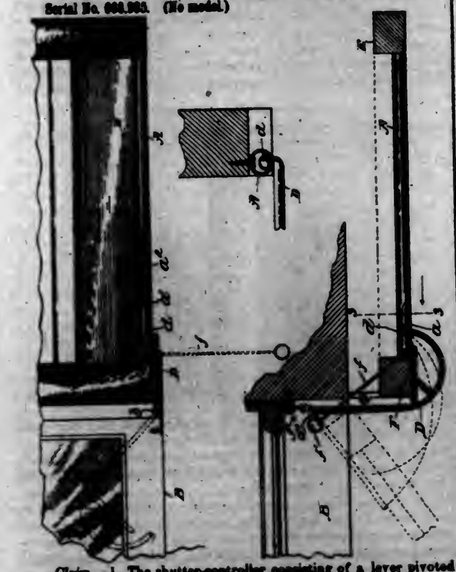
Claim.—1. In a combined table and shelf, the combination of the stand, having pivoted thereto the upper and lower side bars, a series of shelves pivotally connected to said side bars and adapted to stand one above the other, means for converting the said series of shelves into a table and to extend them at angles one to the other, and pawls and racks for holding the said series of shelves in such positions, substantially as shown and described.

2. In a combined table and shelves, the combination of the stand, having pivoted thereto the upper and lower side bars, a series of shelves pivotally connected to the said upper and lower side bars, a pawl and rack for holding the upper and lower series of shelves at various angles one to the other, a quadrant rack mounted on the stand and a pawl secured to the lower side bars and adapted to engage with the said quadrant rack, substantially as shown and described.

3. A combined table and shelves consisting of the frame having pivotally connected thereto, the upper and lower side bars, shelves pivotally connected to said side bars, one of said upper side bars being provided with a rack, and one of the said lower side bars being provided with a pawl adapted to engage with the said rack, means for releasing said pawl, a quadrant rack on the stand and a pawl secured to the lower side bars and adapted to engage with the said quadrant rack, substantially as shown and described.

602,322. HANGER FOR FIRE-HARNESS. MATTHEW HARGOUSE, Detroit, Mich. Filed Aug. 7, 1897. Serial No. 647,479. (No model.)

Claim.—1. A harness-hanger consisting of a supporting-body having a portion of its lower end cut away upon the under rear side, and a lever pivoted in said body and provided with an arm projecting upward on the rear side of the body when in supporting position, and provided with a hook for the engagement of driving-reins with the upper end thereof, the lower end of the lever being provided with a hook to support a portion of the harness, and which hook opens rearwardly, whereby when a pull is exerted upon the driving-reins, the lever will be caused to turn downward at its upper end, and the hook portion will be turned so as to discharge the harness therefrom, substantially as shown.



2. In a harness-hanger, a bifurcated body having a portion cut away upon its lower rear side so as to form the shoulders c', c^2, combined with a lever fulcrumed within the body and provided with an arm projecting upward on the rear side of the upper end of the lever, and with a hook upon its lower end, and which hook opens rearwardly when in a supporting position, the hook being adapted to support a portion of the harness, while the arm at the upper end of the lever supports the rein, and which lever when turned upon its fulcrum by a pull upon the rein, releases both the rein and the harness, substantially as described.

3. In a harness-hanger, the combination of a supporting-body, a lever having a fulcrumed engagement therewith, and constructed to engage a portion of the harness at its lower end and to permit a rein of the harness to have a removable engagement therein, said body provided with a spring, and said lever with a pin to engage the spring, for the purpose described.

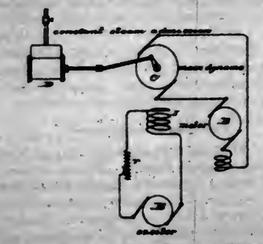
4. In a harness-hanger, the combination of forward and rear supports for the harness, a cord engaged with each of said supports to support the same, an evener to which said cords are connected toward its opposite ends, a counterweight, a cord connecting the evener intermediate its ends with the counterweight, pulleys between the evener and said supports, respectively, over which the corresponding cords are passed, and a pulley between the evener and the counterweight over which the corresponding cord is passed, whereby either of the cords connecting the evener with said supports will be held taut, should the other of said cords be unhooked, substantially as described.

5. In a harness-hanger, two supports having a portion of their lower ends cut away upon their rear edges, provided with two levers, one for each support, and each lever having a slot or recess in each of its ends, combined with suitable supporting cords, chains, or wires, an evener, and a counterweight; the upper ends of the levers being adapted to receive rings connected with the driving-reins and the lower ends to receive the hooks upon the harness to thereby support said harness, whereby when a pull is exerted upon the driving-reins, the levers are caused to turn downward at their upper ends, and the slotted portions of their lower ends are turned so as to discharge the hooks of the harness therefrom, substantially as shown.

602,323. SHUTTER-CONTROLLER. CHARLES S. HASKINS, Reading, and WILLIAM T. CROWELL, Boston, Mass. Filed Feb. 3, 1896. Serial No. 668,985. (No model.)

Claim.—1. The shutter-controller consisting of a lever pivoted at one end to the sill of the window and bent at its other end to engage a slot in a tube fast to the shutter so as to permit longitudinal movement of the end of the lever along the slot and to permit the rotation of the lever; that tube having slots along its side in two planes ninety degrees apart, the two slots being connected by a slot; all organized and operating substantially as described.

2. The shutter-controller consisting of a lever-swivel pivoted at one end to the sill of the window and bent at its other end to engage a slot in a tube fast to the shutter so as to permit longitudinal movement of the end of the lever along the slot and to permit the rotation of the lever; that tube having slots along its side in two planes ninety degrees apart, the two slots being connected by an oblique slot; all organized and operating substantially as described.

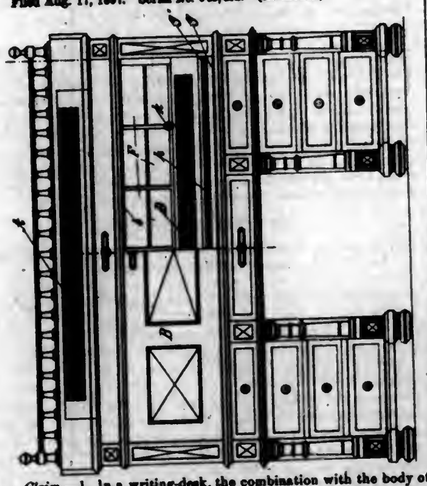


3. The shutter-controller consisting of a lever-swivel pivoted at one end to the sill of the window and bent at its other end to engage a slot in a tube fast to the shutter so as to permit longitudinal movement of the end of the lever along the slot and to permit the rotation of the lever; that tube having slots along its side in two planes ninety degrees apart; the two slots being connected by a slot; and a piece F fast to and projecting substantially at right angles from the lever to serve as a handle for the lever and adapted to give a torsional strain to the lever calculated to turn it upon the swivel when it is free to move, all organized and operating substantially as described.

602,324. PAN-LIFTER. ANTON HAUBERG, Nyack, N. Y. Filed Feb. 27, 1897. Serial No. 625,305. (No model.)

Claim.—A cooking utensil or vessel provided with a radially-extending projection 5 terminating in a raised and substantially cylindrical cross-bar end and having its lower face inclined, and a V-shaped projection 6 below the first-named projection and having its upper face inclined and the lower face substantially horizontal, the said upper projection extending slightly beyond the lower projection and being connected therewith by vertical side plates, in combination with a handling-iron provided with an enlarged end having a downturned hook at its upper edge designed to engage the cylindrical end of the upper projection on the vessel, and a projection below the hook and extending beyond the same, said lower projection being bifurcated, or provided with a V-shaped recess adapting it to snugly grasp the lower projection on the vessel and to rest against said vessel at its end, all substantially as described.

602,325. SYSTEM OF ELECTRICAL PROPULSION FOR VESSELS. JEAN J. HEILMANN, Paris, France. Filed Dec. 3, 1896. Serial No. 570,878. (No model.) Patented in Italy Jan. 28, 1896, No. 38,128; in India Apr. 6, 1896, No. 111; in Russia Apr. 20, 1896, No. 6,610; in Spain July 1, 1896, No. 17,062; in Portugal July 10, 1896, No. 2,099, and in Belgium Oct. 22, 1896, No. 118,016.



Claim.—1. In a system of electrical propulsion for navigable vessels, the combination with a propeller-wheel, of a steam-engine having a constant steam admission, two or more generating-dynamos having their armatures connected in multiple with the main conductors, and driven by said steam-engine, a separately-driven constant-potential exciting-dynamo with which the field-coils of the main dynamos are connected in multiple, a rheostat in series with the exciter-armature for varying the field strength of said dynamos, two or more electric motors connected to the propeller-shaft, and having their field-coils in series multiple with their armatures, and a reversing-switch between the field-coils and the armatures of said motors, substantially as described.

2. In a system of electrical propulsion for navigable vessels, the combination with a propeller-wheel, of a steam-engine having a constant steam admission, a main generating-dynamo driven by said

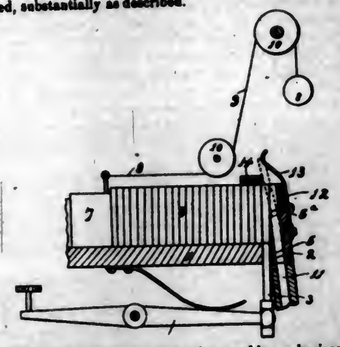
steam-engine, a separately-driven constant-potential exciting-dynamo in circuit with the field-coils of said main generator, a rheostat in series with the exciter-armature for varying the field-magnetism of the main generator, and an electric motor in series with the generator-armature and arranged to drive the propeller-shaft, substantially as described.

602,326. WRITING-DESK. HENRICH HEINE, Hanover, Germany.

Filed Aug. 17, 1897. Serial No. 648,422. (No model.)

Claim.—1. In a writing-desk, the combination with the body of the desk, of slide E running in guides thereon, leaf B hinged to slide E and adapted, when drawn out and raised, to close the front of the desk, and when let down and pushed in, to slide with slide E into the guides thereof, slide D sliding in guides above the slide E and provided with a writing-surface, drawers in the desk, a locking-bar *m* for said drawers and a lever *l* controlling said locking-bars and actuated by the slide E in its rearward movement, so as to unlock the drawers when said slide is pushed in.

2. In a writing-desk, the combination with the body of the desk, of slide E running in guides therein, leaf B hinged to slide E and adapted when drawn out and raised to close the front of the desk, slide D sliding in guides above slide E, a leaf C hinged to slide D and forming a writing-surface and spring-catches *k* for supporting said leaf C in an inclined position, or when pressed back, allowing said leaf to fall flat on slide D, said spring-catches extending above the edge of the leaf C when the latter is raised.



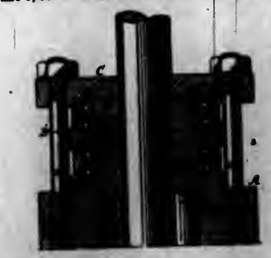
3. In a writing-desk, the combination with the body of the desk, having at its top an inclined surface for writing when standing, of a slide E, running in guides below said surface, a leaf B hinged to slide E, and adapted when raised, to close the front of the desk, and when depressed to be pushed back with slide E in the guides thereof, a slide D, mounted to slide above slide E, and a leaf C hinged to slide D and forming a writing-surface for use when sitting.

602,327. TYPE-SETTING MACHINE. STANLEY H. HODGKIN and PHILIP B. HODGKIN, London, England. Filed Apr. 17, 1897. Serial No. 632,616. (No model.) Patented in England Mar. 23, 1896, No. 6,845.

Claim.—1. In a type setting or composing machine, the combination of a type trough having an opening near one end thereof, a fixed stop adjacent to said opening, a pusher adapted to work through said opening and act against the foremost type in said trough, a discharge-passage in front of said stop, and a movable deflecting device adapted to act against and tilt the forward end of said type so as to bring its other end over said discharge-passage.

2. In a type setting or composing machine, a horizontal or approximately horizontal type-trough having an opening in its lower side and a stop adjacent to said opening, a vertical discharge-passage external to said stop, a pusher arranged to work vertically or approximately so through said opening and act against the bottom of the type above the same, and a deflecting device adapted to cant backward the upper end of a type that is being displaced by said pusher, substantially as described.

3. In a type setting or composing machine, a horizontal or approximately horizontal trough having an opening in its lower side at one end and, adjacent to said opening, a fixed stop terminating at the top in a knife-edge, feeding mechanism whereby a row of type can be fed forward against said stop, a pusher arranged to work vertically through said opening in said trough, a downwardly-extending discharge-passage in front of said stop, and a deflecting device adapted to tilt backward the upper end of a type when the same is being discharged, substantially as described.



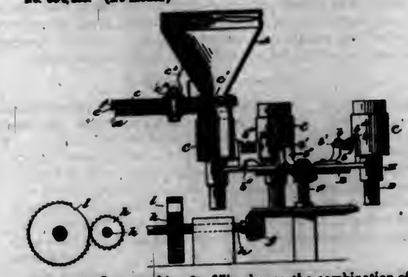
4. In a type setting or composing machine, a horizontal or approximately horizontal trough having an opening in its lower side at one end and, adjacent to said opening, a fixed stop terminating at the top in a knife-edge, feeding mechanism whereby a row of type can be fed forward against said stop, a pusher arranged to work vertically through said opening in said trough, a downwardly-extending discharge-passage in front of said stop, a cross-piece fixed above said trough immediately in rear of the foremost type, and a deflecting device adapted to tilt backward the upper end of said type when it is being removed from said trough, substantially as described.

5. In a type setting or composing machine, the combination of a type-trough having an opening in its lower side at one end, a stop adjacent to said opening, feeding mechanism whereby a row of type can be fed forward against said stop, a pusher adapted to work through said opening and displace type from said trough, a movable deflecting device adapted to tilt each type backward when displaced by said pusher, and key-operated mechanism whereby said pusher and deflecting device are operated.

6. In a type setting or composing machine, the combination of a type trough 1 having an opening 2 and stop 5 with upper knife-edge 5*a*, a vertically-movable pusher 3, arranged to work through said opening, feeding mechanism adapted to feed a row of type along said trough toward said stop, a discharge-passage 11 located in front of said stop, a deflecting device mounted to work over said discharge-passage and act against the upper end of a type when the same is being ejected, and key-operated mechanism adapted to operate said pusher and deflecting device in succession, substantially as described.

602,328. ROD-PACKING. THOMAS H. HOLMES, Wilkes-Barré, Pa. Filed June 3, 1897. Serial No. 639,221. (No model.)

Claim.—1. The combination in a rod-packing, of a segmental ring surrounding the rod, with a ring of non-elastic yielding soft metal mounted on the periphery of the segmental ring, with means for holding the said non-elastic yielding ring tightly against the segmental ring, substantially as described

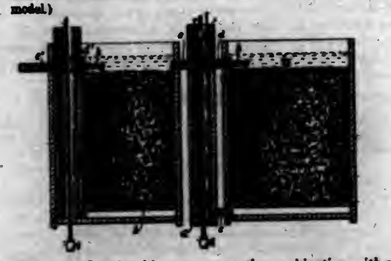


2. The combination in a rod-packing, of the segmental ring D, a spring for holding the segments together on the rod, a segmental ring E mounted against the ring D and having the joints between the segments staggered, a non-elastic yielding soft-metal ring mounted on the periphery of the ring E and a spring tending to hold the soft-metal ring against the segments making a steam tight joint between the segments and the ring, substantially as set forth.

602,329. PULVERIZER. WILLIAM H. HOWE and PETER STIEFERMAN, Kiever, Mo. Filed Sept. 28, 1897. Serial No. 653,405. (No model.)

Claim.—In a pulverizer, a pair of bars provided with horizontally-alined bearings, pipes rotatably mounted in said bearings, set-collars located upon said pipes to prevent their lateral movement, harrow-teeth passing vertically through said pipes, in which harrow-teeth are formed notches, triangular bars passing through said pipes and engaging in the notches of the harrow-teeth, collars fixed upon all of the pipes, fingers extending upwardly from each of said collars, a bar connecting the upper ends of all fingers, and means for rotating the forward one of said pipes and locking it after being rotated to the desired position substantially as specified.

602,330. MEASURING MECHANISM FOR BOX OR CAN FILLING MACHINES. PHIL L. HOYTE and WILLIAM T. WOOD, Nashville, Tenn., said Wood assignor to said Hoyte. Filed Apr. 20, 1897. Serial No. 634,425. (No model.)



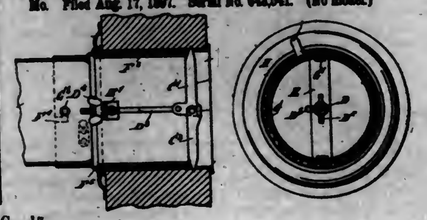
Claim.—1. In a machine for filling boxes, the combination of an intermittently-rotated carrier, box-holders on said carrier having boxes therein, and a feed-hopper having a discharge-opening in the bottom, of a plate provided with a series of holes near its periphery corresponding in number to the number of box-holders and mounted to rotate under and in contact with the discharge of the hopper and in contact with the tops of the boxes, a star-wheel attached to the bottom of the plate having its recesses registering with the holes in the plate, and means for intermittently rotating the carrier to cause the boxes to successively engage the star-wheel, whereby the plate is turned to bring the holes successively in register with the discharge-opening in the hopper and with the boxes, substantially as described.

2. In a machine for filling boxes, the combination with an intermittently-rotated carrier, box-holders on said carrier having boxes therein, and a feed-hopper having a discharge-opening in the bottom, of a plate fixedly mounted on one side of the hopper having an opening in its periphery registering with and forming a continuation of the discharge of the hopper, a plate or disk having a series of openings near its periphery and rotatably mounted below and in close proximity to said fixed plate, a star-wheel attached to the bottom of said rotating plate or disk with its recesses registering with the openings therein, and adapted to be engaged by the boxes in succession as the latter are rotated by the carrier to cause the said boxes to bring the perforations in the rotary plate in register with the openings of the fixed plate and the box, substantially as described.

3. In a machine for filling boxes, &c., the combination with an intermittently-rotated carrier, box-holders on said carrier having boxes therein, and a feed-hopper having a discharge-opening in the bottom, of a disk mounted on said hopper below the discharge-opening and having a perforation near its periphery registering with said discharge-opening, a plate journaled on the hopper below said fixed plate and having a series of perforations near its periphery adapted to register with the perforation in the fixed plate, a washer of suitable material interposed between the two said plates, a star-wheel attached to the bottom of the rotating plate having its indentations or recesses registering with the perforations in said plate and adapted to be engaged by the boxes, substantially as described.

4. In a machine for filling boxes, &c., the combination with an intermittently-rotated box-carrier, box-holders on said carrier having boxes therein, and a vertical feed-hopper having a discharge-opening in the bottom of a disk or plate provided with a series of openings near its periphery journaled on the side of the hopper so as to rotate under and in contact with the opening in the hopper, and normally closing the said opening, of means carried by said plate adapted to be engaged by the boxes in succession for causing the plate to rotate in contact with the tops of the boxes and bring the openings successively in register with the discharge-opening in the hopper and with the boxes, whereby the said boxes are caused to be filled even with the top with material as the hopper-discharge is opened and closed by said plate, substantially as described.

602,331. APPARATUS FOR LEACHING TANBARK. CHARLES IRRGANG, Elmira, N. Y. Filed Mar. 22, 1897. Serial No. 628,700. (No model.)



Claim.—1. In a leaching apparatus, the combination, with a vat provided with a perforate false bottom, of a stand-pipe having communication at the top with the upper portion of the vat at or near the water-level therein, and at the bottom with the vat below the false bottom, a pipe passing through the stand-pipe adapted to be supplied with steam or hot water, a valve in the pipe below the stand-pipe, whereby the flow through the heater-pipe may be controlled and any desired temperature imparted to the liquid in the stand-pipe and a circulation upward through the stand-pipe and downward through the vat produced substantially as described, and a draw-off pipe leading from the vat below the false bottom.

2. In a leaching apparatus, the combination, with a series of vats having perforate false bottoms, of intermediate stand-pipes, each of said stand-pipes having communication at the bottom with one vat in the series below its false bottom and at the top with the upper portion of the next adjacent vat at or near the water-level therein, pipes passing through the stand-pipes adapted to be supplied with steam or hot water, means for controlling the flow therethrough, whereby the liquid as it passes through the series of vats is maintained at the required temperature and a circulation of the liquid from vat to vat is produced or augmented substantially as set forth, and draw-off pipes leading from the vats below their false bottoms.

3. In a leaching apparatus, the combination, with a series of vats provided with false bottoms, of intermediate stand-pipes, each of said stand-pipes having communication at the bottom with one vat of the series below its false bottom, and at the top with the upper portion of the same vat and of the next adjacent vat at or near their respective water-levels, pipes leading through the stand-pipes adapted to be supplied with steam or hot water whereby the liquid is maintained at the required temperature and an upward circulation of the liquid through the stand-pipes produced or augmented, means for opening and closing the communications at the top of the stand-pipes in order that one vat may be operated separately or in any number operated in series as may be desired, and draw-off cocks leading from the vats below the false bottoms.

4. In a leaching apparatus the combination of a vat, a stand-pipe connected therewith, a steam or hot-water pipe passing through the center of the stand-pipe, and a piston adapted to fit into the stand-pipe and around the steam or hot-water pipe and to be forced downward into the stand-pipe in order to produce a backflow in the vat for the purpose set forth.

602,332. STOVEPIPE-FASTENER. JEROME JONES, Kansas City, Mo. Filed Aug. 17, 1897. Serial No. 648,541. (No model.)

Claim.—1. In a stovepipe-fastener, the combination of a thimble, a support secured to the thimble and extending across one end thereof, a rod attached to the support, the rod running through the thimble, a short pipe-section fitting within the thimble, a cross-piece secured to said pipe-section and engaged by the rod, the pipe-section having a bead formed therein, a ring-shaped cover engaged by the bead and surrounding the said pipe-section, and a main stovepipe fitting and removably secured within the pipe-section.

2. In a stovepipe-fastener, the combination of a thimble, a support fitting within the thimble and engaged rigidly therewith, the support consisting in two arms pivoted one to the other and one arm having a stop limiting the movement of the arms, a rod connected with the arms, a short pipe-section fitting within the thimble, a cross-piece secured to the short pipe-section and connected with the rod, a ring-shaped cover surrounding the short pipe-section and engaged by a bead thereon, and a main pipe-section fitted and secured within the short pipe-section.

602,883. MATCH BOX OR SAFE. BERNARD W. KARST, Harianburg, Ind., assignor of one-half to George R. Miller, same place. Filed Oct. 19, 1897. Serial No. 655,670. (No model.)

Claim.—1. A match box or safe comprising a casing having a delivery-slot in its front, and an openable back, a partition separating the interior of the casing into two compartments and provided with a groove and an opening at the upper end of the groove, a picker carried by a guide-block movable in the forward compartment, said picker comprising a pivoted arm having at one end picker-fingers and at the other end a cam projection movable in the groove and adapted to enter the opening to tilt the picker and project the fingers through the delivery-slot, means for elevating the picker, and a guide-plate leading from the rearward into the forward compartment, substantially as described.

2. A match box or safe comprising a casing having a delivery-slot in its front, and a back pivoted near its lower end, a partition dividing the interior of the casing into a rearward compartment for containing a package of matches and a forward compartment, said partition having a groove terminating at its upper end in an opening, an inclined guide-plate to guide the matches from the package into the forward compartment, a guide-block vertically movable in the forward compartment, a picker-arm pivotally secured to said block and carrying at one end picker-fingers and having at its other end a cam projection for cooperating with the groove and opening, a cord connected to the block and passed around a sheave in the upper portion of said compartment and passed through the side of the casing and provided with a hand-button, and a stop on the outer side of the casing adapted for engagement with the button to hold the picker in its elevated position, substantially as described.

602,884. ROTARY ENGINE. MARTIN C. KESSLER, Ofiead, Ind. Filed Dec. 3, 1897. Serial No. 660,662. (No model.)

Claim.—1. In a rotary engine, the combination with the casing the rotary piston-hub having radial and lengthwise slots, and pistons proper arranged slidably in such slots, of segmental packing-pieces arranged at the ends of such hub and having radial grooves to receive the ends of said pistons, substantially as shown and described.

2. In a rotary engine, the combination with the casing the piston hub having pistons proper and provided with notches or slots in its ends, of segmental packing-pieces arranged radially, and having internal tongues that fit and are adapted to slide in such notches or slots, substantially as shown and described.

3. In a rotary engine, the combination with the casing and the piston-hub having radial slots and rabbeted ends, of pistons, and segmental packing-pieces arranged in the slots and rabbets, and guided as they slide radially, springs for projecting said pistons and pieces, and disks applied to the ends of the hub to work in contact with and support the packing-pieces, substantially as shown and described.

4. In a rotary engine, the combination with the casing the piston-hub, and pistons proper, of segmental packing abutting the ends of said hub and pistons, and disks arranged exterior to the latter, substantially as described, for the purpose specified.

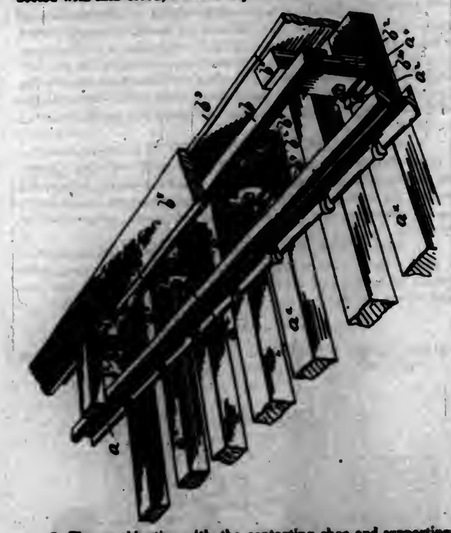
5. In a rotary engine, the combination with the casing the rotary slotted piston-hub, pistons arranged in the slots, and a series of segmental packing-pieces arranged at the ends of said hub and pistons, and having lapped end portions, as shown and described.

6. In a rotary engine, the combination with the casing rotary piston-hub, and pistons proper, of segmental packing-pieces arranged at the ends of said hub and pistons, of "bridges," or connecting-pieces, held in sockets formed in adjacent ends of the latter, substantially as shown and described.

7. In a rotary engine, the combination with the casing the rotary piston-hub and pistons, of the segmental packing-pieces arranged at and abutting the ends of said hub and piston, and having lapped ends provided with sockets and connecting-pieces or "bridges" arranged and held in such sockets, substantially as shown and described.

602,885. STOVE-LEG. AARON KNISELL and IRVING J. SPARR, Cygnet, Ohio. Filed Nov. 30, 1897. Serial No. 660,196. (No model.)

Claim.—1. In combination with a stove-leg having a cavity or recess therein with grooves communicating therewith, a caster or roller lowering and elevating device pivotally mounted in said leg, and a brace movably attached to the said caster lowering and elevating device at its lower end and having a cross-trunnion at its upper end movable in said grooves, substantially as described.



2. In combination with a stove-leg, of a caster lowering and elevating device, and a brace movably attached at its lower end to said caster lowering and elevating device and at its upper end having a cross-trunnion moving in the stove-leg, substantially as described.

3. The combination of a stove-leg having a cavity or recess therein with grooves on the opposite sides of the upper portion thereof terminating in lower shoulders and also provided with a transverse recess, a head pivoted in the lower portion of the said cavity or recess, and provided with a roller or caster and a handle, and a bifurcated brace having its lower end pivoted to the handle of the head and its upper end formed with a cross-trunion adapted to engage the said grooves and transverse recess, substantially as described.

602,886. CONDUCTOR AND CONTACT DEVICE FOR ELECTRIC RAILWAYS. ALVARO S. KROTZ, Springfield, Ohio, WILLIAM P. ALLEN, Chicago, Ill., and OLIVER S. KELLY, Springfield, Ohio. Filed May 26, 1897. Serial No. 638,647. (No model.)

Claim.—1. In a third-rail electric-railway system, the combination of insulating-standards erected alongside the track, a working conductor supported by said standards on the inner side thereof at an elevation above the track, but below the upper ends of the standards, the said conductor projecting horizontally from the standard, and a transversely inclined or sloping cover resting on the tops of the standards and on the extreme edge of the horizontal portion of the conductor, substantially as described.

2. A contacting device for third-rail electric-railway systems, the same comprising a suitably-formed body portion or frame having a shoe, a block pivoted thereto, and a resilient supporting-piece connected with said block, substantially as described.

3. The combination with the contacting shoe and supporting-frame, a pivoted block in said frame, and a flexible supporting-strip connected to said block, substantially as and for the purpose specified.

4. The combination with the contacting shoe, the supporting-frame, the adjustable block pivoted in said frame, the connecting-strip from said block to said shoe, and a supporting-strip extending from said block in contact with said connecting-strip, substantially as specified.

5. The combination with the angularly-shaped contacting shoe and the supporting-frame, angular in cross-section, a pivoted block in said frame, a connecting strip extending between said shoe and frame and connected to said block, and a supporting-strip connected to said block and in contact with said connecting-strip, substantially as specified.

6. The combination with the angle-shaped working conductor, the supporting-standards therefor, the inclined cover and vertical shield for protecting said standards and conductor, said standards being formed in parts and perforated by openings extending substantially parallel with said conductor, substantially as and for the purpose specified.

7. The combination with the standards, the angle-shaped conductor secured thereto, the vertical shield and inclined cover, said shield being projected slightly above said standards and gained into said cover, said cover being supported by said shield, substantially as specified.

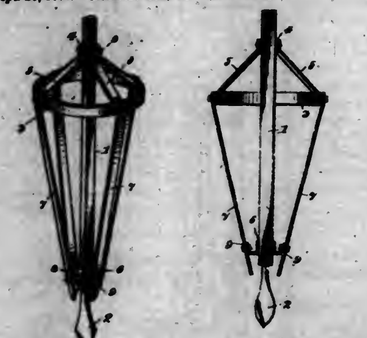
602,887. TAILPIECE FOR MUSICAL INSTRUMENTS. ROBERT R. LAMBERT, Perrysburg, Ark. Filed June 26, 1897. Serial No. 641,762. (No model.)

Claim.—1. A tailpiece having two members, and an eccentric connecting the two members with each other, whereby one of the members may be moved forward and rearward.

2. A tailpiece having two members each with a tabulated portion, and a shaft journaled in one tabulated portion and having an eccentric trunnion engaging the other tabulated portion, whereby upon the turning of the shaft one of the members may be moved forward and rearward.

3. A tailpiece consisting in two members, one with a tabulated portion having a slot therein, and the other with two tabulated extensions, a shaft revolubly journaled in the first-named member, a bar fixed to said shaft and movable through the slot of said first-named member, and eccentric trunnions for the shaft, the trunnions respectively engaging the tabulated extensions of the second-named member.

602,888. BOTTLE. LEWIS E. LARRIMER, Schooley's Mountain, N. J. Filed Dec. 23, 1897. Serial No. 663,631. (No model.)

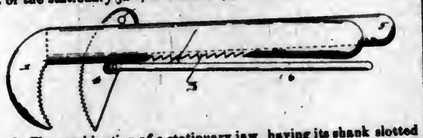


Claim.—1. The combination with a bottle or like receptacle, of a smaller receptacle, the lower portion of which has a solid connection with the neck of the bottle and two tubular connections forming passage-ways between the upper part of the neck of the bottle and the said smaller receptacle, substantially as described.

2. The combination with a bottle or like receptacle, of a smaller receptacle connected with the neck portion of the larger receptacle and communicating with the interior thereof, the said smaller receptacle having its mouth end extending upward beyond the top of the larger receptacle, and a valve-stopper for the larger receptacle capable of opening or closing the communication between the two receptacles, substantially as described.

3. The combination with a bottle or like receptacle, of a vial secured to the neck portion of the said bottle, two tubular connections forming passage-ways between the upper part of the neck portion of the bottle and vial, the mouth portion of the said vial projecting above the top of the bottle, a stopper for the vial and a valve-stopper for the bottle adapted to open and close the passage-ways between the neck of the bottle and the vial, substantially as described.

602,889. WELL-DRILL. EDGAR LAWTON, Oneonta, N. Y. Filed Sept. 20, 1897. Serial No. 652,304. (No model.)



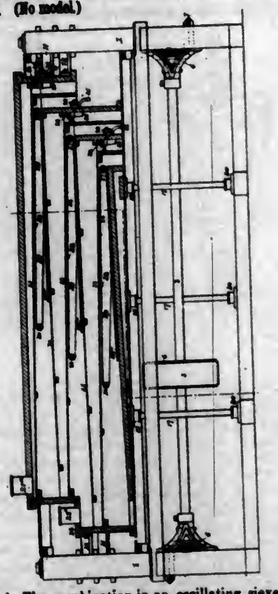
Claim.—1. The combination with a drill-shaft, of an attachment therefor consisting of a frame made up of a ring or band, collars at the upper and lower ends thereof of smaller dimensions than said ring, the lower of said collars having outwardly and upwardly extending flanges thereon, bracing-bars connecting the upper collar with said ring, and cutting-blades or knives secured at their upper ends to said ring, and at their lower ends to said flanges.

2. The combination with a drill-shaft, of an attachment therefor consisting of a frame, made up of a ring or band, collars at the upper and lower ends thereof, of smaller dimensions than said ring, the lower of said collars having outwardly and upwardly extending flanges thereon, bracing-bars connecting the upper collar with said ring, and removable cutting-blades or knives secured at their upper ends to said ring, and at their lower ends to said flanges.

602,840. PIPE-WRENCH. JOHN W. LUND, Boston, Mass., assignor of one-half to John J. Morris, same place. Filed May 21, 1897. Serial No. 637,570. (No model.)

Claim.—1. In a pipe-wrench, the combination of a stationary jaw having its shank slotted, a movable jaw positioned within the slotted shank of the stationary jaw, and capable of longitudinal and angular adjustment with relation thereto, the shank of the stationary jaw be-

ing provided with a series of teeth, a rod secured at one end to the movable jaw, a lug formed on said rod adapted to engage the teeth of the stationary jaw when its lower end is contracted, and means for preventing the movable jaw from becoming disengaged from the slot of the stationary jaw, substantially as set forth.



2. The combination of a stationary jaw, having its shank slotted longitudinally, a movable jaw adapted to move within said slot, a pin extending through the stationary jaw on the outer side of the shank of the stationary jaw, a rod secured to the movable jaw on the opposite side of the shank of the stationary jaw, whereby said jaw is prevented from becoming displaced from the slot in which it moves, a series of teeth formed on the shank of the stationary jaw, and a lug carried by the rod for engaging said teeth when the opposite end of the rod is contracted, substantially as set forth.

3. In a pipe-wrench, a plurality of members each comprising a pipe-gripping jaw, and a shank connected rigidly to and to manipulate said jaw, said shanks being extended in proximity to each other, and means, extended along said shanks, to fix said members in adjusted longitudinal position relative to each other, while permitting variation in their relative angular position, substantially as described.

4. In a wrench, a plurality of loosely-assembled members each comprising a jaw and a manipulating-shank; means to prevent displacement of said members; and an auxiliary controlling member extended in proximity to said manipulating-shanks, to fix said members in adjusted longitudinal position, while permitting variation in their angular relation, substantially as described.

602,841. OSCILLATING SIEVE OR BOLTING-MACHINE. CHARLES H. LOUTHENBERG, Philadelphia, Pa., assignor to Walter Griscom and Thomas McPeely, same place. Filed Mar. 18, 1897. Serial No. 628,190. (No model.)

Claim.—1. The combination in an oscillating sieve or bolting-machine, of a pair of sieve-boxes located side by side, upright shafts at the ends of the boxes, each having oppositely-set crank-pins, and brackets projecting from the opposite ends of the sieve-boxes and engaging said crank-pins, an upper crank of one shaft, and a lower correspondingly-set crank of the other shaft being connected to each box, substantially as specified.

2. The combination of a bolting-sieve with an adjustable cut off consisting of an apron located beneath the sieve and passing around a bearing adjacent to the discharge end of the same, the opposite ends of said apron being connected by cords to a winding-drum in advance of the apron, whereby on turning said drum the apron may be positively moved in either direction, substantially as specified.

3. The combination of a bolting-sieve with an adjustable cut-off consisting of an apron located beneath said sieve and passing around a bearing adjacent to the discharge end of the same, a winding-drum located in advance of the apron, cords wound upon said drum and connected to the opposite ends of the apron, and inclined guides for the end of the lower run of the apron, whereby said lower run is directed at an angle the reverse of that of the upper run, substantially as specified.

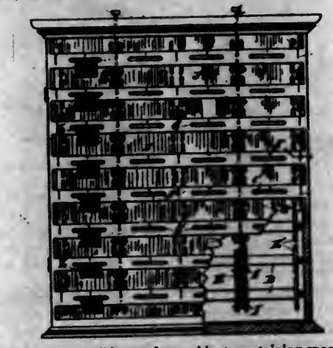
4. The combination of the sieve-frame of a bolting-machine, with an eccentric serving as a support for the lower end of said frame, an eccentric-spindle passing through the sieve-casing and having outside the same a sliding handle whereby it may be turned, and a nut mounted on said spindle beyond the handle, substantially as specified.

5. The combination in an oscillating sieve or bolting-machine, of a pair of upright crank-shafts, brackets having boxes receiving the cranks of said shafts, a longitudinal bar carried by said brackets and a sieve-box secured to said bar, substantially as specified.

602,842. CAR-COUPLING. ISAAC LOW, East Fairfield, Ohio. Filed Oct. 27, 1897. Serial No. 656,533. (No model.)

Claim.—A car-coupling comprising a draw-head having an open upper side, a longitudinal slot in the lower wall thereof, bearings at the rear end of the draw-head for the support of the coupling-pin when raised, a pivoted bar resting in said bearings and provided with parallel arms, and a coupling-pin pivoted between said arms and provided with an enlargement 5 intermediate its ends, and pivots thereon for engagement with the parallel arms, said enlargement being formed integral with the pin and adapted to rest on the link when in place, for the purpose and substantially as described.

602,848. VALVE-GEAR. WILLIAM LOWE, Sydney, New South Wales. Filed Aug. 7, 1897. Serial No. 647,449. (No model.)



Claim.—1. A valve-gear, comprising a link for connection with the valve-stem, a slidable block pivotally connected with the said link, an adjustable guideway carrying the said block, a second link pivotally connected with the said block, and a rod pivotally connected with the said second link and having a forward-and-backward and swinging motion, substantially as shown and described.

2. A valve gear, comprising a link for connection with the valve-stem, a slidable block pivotally connected with the said link, a guideway in which the said block moves, means for adjusting the said guideway for reversing purposes, a second link pivotally connected with the said block, and an eccentric-rod pivotally connected with the said second link and mounted to swing on a slidable block, substantially as shown and described.

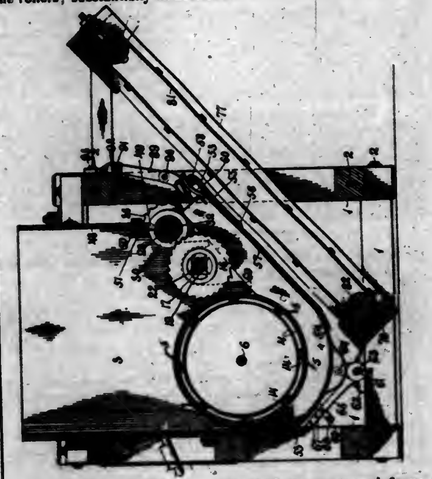
3. A valve-gear, comprising a link for connection with the valve-stem, a slidable block pivotally connected with the said link, a second link pivotally connected with the said block, an eccentric-rod pivotally connected with the said second link, and a second slidable block pivotally connected with the said eccentric-rod and moving parallel to the first-named slidable block, substantially as shown and described.

4. A valve-gear provided with an adjustable guideway, a block fitted to slide thereon and connected with the valve, a second block mounted to slide parallel with the first-named block, an eccentric-rod pivoted on the said second block, and a connection between the said eccentric-rod and the first-named block, substantially as shown and described.

602,844. LACE OR RIBBON CABINET. CHARLES H. MARTIN, Marshall, Ill. Filed Dec. 28, 1896. Renewed Oct. 20, 1897. Serial No. 656,242. (No model.)

Claim.—1. A ribbon or lace cabinet, containing spools arranged in vertical and horizontal columns, a rod passing between two adjacent columns of spools and provided with locking-arms normally in engagement with said spools and preventing the same from turning, a spring to hold said rod and arms in normal position, and a knob or handle upon said rod and by which it is depressed to simultaneously release the locking-arms from the spools, substantially as set forth.

2. A ribbon or lace cabinet, containing rows of spools for holding the goods, said spools having notches in the outer edge of one of their heads, a rod passing by the ends of the spools in the different tiers, pins carried by the rod and adapted to engage the notches in the spools to lock the same, a spring to hold the pins in engagement with the spools, and a knob or handle attached to said rod upon the outside of the case, substantially as described.



3. A ribbon or lace cabinet having a front composed of strips formed with slits, rows of spools for the goods and located in said cabinet in the rear of the slits through which the goods may be withdrawn, the heads of the spools having notches therein, a vertical rod located adjacent the notched heads and having locking-arms, a spring holding said arms normally in engagement with said notches, and a knob on said rod at the outside of said cabinet and by which said rod is depressed to disengage the arms from the notches, as and for the purpose set forth.

602,845. FEED-CUTTER. ANDREAS MATTIJETS, Los Angeles, Cal. Filed Aug. 11, 1897. Serial No. 647,875. (No model.)

Claim.—1. The combination of a supporting-frame, a hopper, a stepped frame, a feed-drum having rows of teeth at intervals around its periphery and a shaft journaled on the lowest step of the stepped frame, the circular saws having a shaft journaled on the intermediate step of the stepped frame, the disks having a shaft journaled on the highest step of the stepped frame, and means whereby the shafts are operated; substantially as described.

2. The combination of a supporting-frame, a hopper, a stepped frame, a feed-drum having rows of teeth and a shaft provided with a pulley and journaled on the lowest step of the stepped frame, the circular saws having a shaft provided with a pulley and journaled on the intermediate step of the stepped frame, the disks having a shaft provided with a pulley and journaled on the highest step of the stepped frame, the hanger secured to the supporting-frame, the lever having a head and pivoted to the hanger, the paired rollers mounted in the head of the lever, and the driving-belt working around the pulleys and over the rollers; substantially as described.

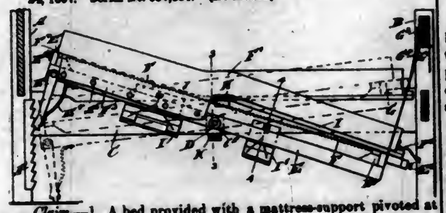
3. The combination of a supporting-frame, a hopper, a stepped frame, a feed-drum having rows of teeth and a shaft provided with a pulley and journaled on the lowest step of the stepped frame, the circular saws having a shaft provided with a pulley and journaled on the intermediate step of the stepped frame, the disks having a shaft provided with a pulley and journaled on the highest step of the stepped frame, the hanger secured to the supporting-frame, the lever having a head at one end and a catch engaging the rack-bar at the other end, and pivoted to the hanger, the paired rollers mounted in the head of the lever, and the driving-belt working around the pulleys and over the rollers; substantially as described.

4. The combination of a supporting-frame, a stepped frame, a feed-drum having rows of teeth at intervals around its periphery and a shaft journaled on the lowest step of the stepped frame, the circular saws having a shaft journaled on the intermediate step of the stepped frame, the disks having a shaft journaled on the highest step of the stepped frame, a hopper having a rear board provided with teeth fitting between the disks, and means whereby the shafts are operated; substantially as described.

5. The combination of a supporting-frame, a hopper, a stepped frame, a feed-drum having rows of teeth at intervals around its periphery and a shaft journaled on the lowest step of the stepped frame, the circular saws having a shaft journaled on the intermediate step of the stepped frame, the disks having a shaft journaled on the highest step of the stepped frame, a sieve-frame extending beneath the hopper and having its lower end in the form of a cradle, the sieve, means whereby the shafts are operated and means for vibrating the sieve-frame; substantially as described.

602,846. RUBBER-TIRED WHEEL. CHARLES A. MAYNARD, Springfield, Mass. Filed Jan. 10, 1898. Serial No. 666,196. (No model.)

Claim.—1. A felly, a rim arranged on the felly and provided with side flanges, a rubber tire seated in the rim, and a metal retaining-band combined with the tire by being embedded therein, and comprising two tubes lying within the rim-flanges on opposite sides of the vertical center of the tire and united by a web, means for coupling the ends of the retaining-band, and bolts passing through the web and clamping it to the rim and felly.



2. A felly, a rim arranged thereon and provided with side flanges, a rubber tire seated on the rim, a metal retaining-band combined with the tire and comprising two side tubes tied together by an intermediate web, said tubes inclosed by the tire on opposite sides of its vertical center, a coupling consisting of dowel-pins within the abutting tube ends and fast to both and forming a coupling maintaining a uniform and unbroken exterior to the retaining-band, and bolts for uniting tire, rim and felly.

3. A felly, a rim thereto provided with side flanges for seating the tire, a retaining-band for holding the tire to the rim, and comprising a metal band with its opposite edges turned over to form tubes and an intermediate portion left as a web between the tubes, and combined with the tire by having the tubes inclosed therein on opposite sides of its vertical center, means for coupling the ends of the retaining-band, and means for securing tire, rim and felly together.

4. The combination of a felly, flanged rim seated thereon, rubber tire seated in the rim, metal retaining-band comprising side tubes inclosed in the tire and intermediate web, bolt with its head bearing upon the web and stem passing through rim and felly, and elongated hole in the web beneath the bolt-head of greater diameter than the bolt-stem and of less diameter than its head, whereby the bolt may be slid under the rubber for adjustment as described.

5. The metal retaining-band comprising two side tubes and connecting-web, and adapted to be combined with a rubber tire to have the tubes inclosed therein on each side of its vertical center; and a joint for the band ends comprising pins received in both ends of the joined tubes and made fast to both, and a tongue from the web of one member adapted to rest against and be secured to the web of the other member.

602,847. BED. ELBERT R. MUSSER, Spencer, Iowa. Filed May 24, 1897. Serial No. 637,856. (No model.)

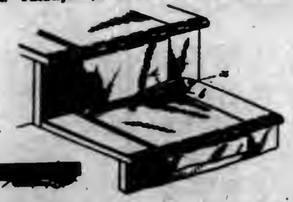
Claim.—1. A bed provided with a mattress-support pivoted at or near the middle, an adjustable seat under the mattress near the middle, two pivotally-attached limb-supports carried by the mattress-support and pivoted stops fixed in the top of the bedstead-rails, and serving to hold the seat.

2. A bed provided with a mattress-support pivoted at or near the middle, two hinged spring-actuated legs at its head end, notched plates fastened to the lower end of the bedstead-posts and engaged by the legs, and straps holding the foot end of the mattress-support.

3. A bed, provided with a mattress support mounted at or near the middle on a pivot resting on the inside of the bedstead-rails, a spring secured at its ends to the ends of the said mattress-support, a transversely-extending seat-board extending over the said spring and under the mattress at or near the middle of the mattress, and adapted to be sustained from the bedstead-rails, two limb-supports pivotally attached to the said transversely-extending seat-board, and adapted to support the divided parts of the mattress in any desired position, knobs fixed in the footboard of bedstead whereby to hold the limb-supports, legs pivotally attached to the head end of the mattress-support, springs actuating the legs notched plates on the lower ends of the head-posts of the bedstead with which plates the legs coact, and pivoted stops in gutters in the bedstead-rails, the stops serving to hold the seat-board.

4. A bed having a mattress-support legs attached to the head end of the mattress-support, springs actuating the legs and plates, having notches receiving the legs, substantially as described.

5. A bed having a mattress, a spring therefor, and a transversely-extending adjustable seat-board placed under the mattress and above the spring, at or near the middle of the mattress, and having its ends resting on the bedstead-rails, substantially as described.



6. In a bed, the combination of a bed-frame, a mattress-frame mounted to swing within the bed-frame, the mattress-frame having a pivot located intermediate the ends of the mattress-frame, a seat-board mounted on the bed-frame and extending over the mattress-frame, a spring-pressed leg pivotally mounted on one end of the mattress-frame and engaging a portion of the bed-frame to hold the mattress-frame in tilted position, and a strap attached to the opposite end of the mattress-frame and to the bed-frame, the strap coacting with the leg.

7. The combination of a bed-frame, a mattress-frame mounted to swing therein, a leg pivoted to one end of the mattress-frame and engaging the bed-frame, a strap attached to the opposite end of the mattress-frame and to the bed-frame, a mattress held on the mattress-frame and having a split portion, a seat-board held by the bed-frame and located beneath the mattress, two limb-supports hinged to the seat-board and respectively beneath the split portions of the mattress, and means for supporting the free ends of the limb-supports.

8. The combination of a bed-frame, a mattress-frame mounted to rock on the bed-frame, a leg hinged to one end of the mattress-frame and capable of engaging the bed-frame to hold the mattress-frame in tilted position, a seat adjustably held by the bed-frame, two limb-supports hinged to the seat-board, and means for supporting the free ends of the limb-supports.

9. The combination of a bed-frame, a mattress-frame mounted to swing therein, a seat-board carried by the bed-frame, a mattress-spring carried by the mattress-frame and located beneath the seat-board, and a mattress rested on the spring and located above the seat-board.

602,848. STAIR-CARPET FASTENER. GEORGE F. MURDOCK, Wellsville, Ohio. Filed Apr. 26, 1897. Serial No. 633,901. (No model.)

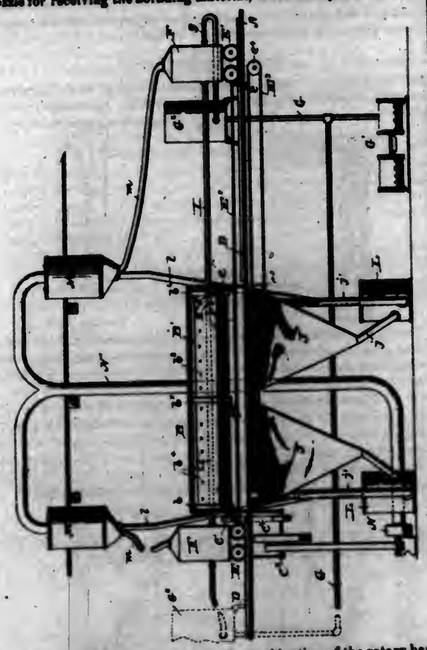
Claim.—1. A fastening device for carpets, consisting of a bar having an engaging prong upon the under side thereof, and a slot therein, said bar being provided with a diagonally-arranged face at a point adjacent to the outer end of said slot, against which the head of the securing-screw is adapted to bear when the latter is being seated, as and for the purpose set forth.

2. A fastening device for carpets, consisting of a bar having a prong upon the under side thereof and a keyhole-slot therein, said bar being provided with a diagonally-arranged face at a point adjacent to the contracted end of said slot, against which the head of the securing-screw is adapted to bear when the latter is being seated, as and for the purpose set forth.

3. A fastening device for carpets, consisting of a bar having an engaging prong upon the under side thereof, and a slot therein through which a securing-screw is adapted to be passed, said bar being provided with a diagonally-arranged face at a point adjacent to the outer end of said slot, which lies at right angles to the shank of said screw, and against which the head of said screw is adapted to bear, and a plate slidingly mounted in said bar and adapted to cover the head of said screw, as and for the purpose set forth.

4. In a device of the character set forth, the combination with a wear-plate secured to the step at the angle between the horizontal and vertical portions thereof, of a bar having a keyhole-slot therein, a prong at the inner end thereof adapted to engage the top surface of the carpet, and a diagonally-arranged face adjacent to the contracted portion of said slot, and a screw passing through said wear-plate, diagonally, whose head is adapted to bear against the diagonally-arranged face of said bar, as and for the purpose set forth.

602,849. ABRADING MECHANISM. WILLIAM A. McCOOL, Beaver Falls, Pa. Filed May 13, 1897. Serial No. 636,412. (No model.) Patented in England Nov. 14, 1896, No. 25,686; in France Sept. 14, 1897, No. 270,462, and in Belgium Sept. 24, 1897, No. 130,827.



Claim.—1. In an abrading mechanism, the combination of the rotating barrel or cylinder adapted to have the articles to be abraded supported therein, a delivery-nozzle within said cylinder, and means for supplying said nozzle with a blast of air charged with abrading material, substantially as set forth.

2. In an abrading mechanism, the combination of a rotary barrel or cylinder adapted to support a series of articles to be abraded, a non-rotary tube or duct extending longitudinally of the interior of said barrel, a nozzle carried by said duct within the barrel, and means for supplying said duct with a blast of air charged with abrading material, substantially as set forth.

3. In an abrading mechanism, the combination of a rotary barrel or cylinder adapted to receive and loosely support the articles to be abraded, a nozzle arranged to reciprocate within the barrel, and means for supplying said nozzle with a blast of air charged with abrading material, substantially as set forth.

4. In an abrading mechanism, the combination of a rotary support or holder for the articles to be abraded, two oppositely-extending non-rotary nozzles, supported by said holder at one side of the articles to be abraded, and means for supplying a blast of air charged with abrading material to said nozzles, substantially as set forth.

5. In an abrading mechanism, the combination of a duct or tube, a nozzle carried by said duct, a holder for articles to be abraded adapted to rotate about the axis of the tube or duct, means for supplying a blast of air charged with abrading material to the nozzle, means for reciprocating the duct and nozzle, and means below said nozzle for receiving the abrading material, substantially as set forth.

6. In an abrading mechanism, the combination of the rotary barrel or cylinder adapted to receive a number of articles, a movable truck, the duct or tube extending from the truck to the interior of the cylinder and provided with a nozzle which travels with the truck longitudinally of the cylinder, and means for supplying abrading material to the duct and nozzle, substantially as set forth.

7. In an abrading mechanism, the combination of a support for the articles to be abraded adapted to impart rotation to said articles, a delivery-nozzle traveling longitudinally of the support, and means for supplying said nozzle with a blast charged with abrading material, substantially as set forth.

8. In an abrading mechanism, the combination of a holder adapted to support articles to be abraded, a delivery-nozzle, means for supplying said nozzle with a blast of air, a receptacle for abrading material, a duct for conveying the abrading material to the said nozzle, and means for moving both the holder and nozzle relatively to each other, substantially as set forth.

9. In an abrading mechanism, the combination of a support or holder, for the articles to be abraded, a receptacle adapted to contain air under pressure, a tube or duct leading from said receptacle and provided with a nozzle, means for moving said nozzle relatively to the holder when in use, an elevated receptacle for abrading material, means for delivering abrading material from said receptacle to said delivery duct or tube, a hopper arranged below the said holder or support, and a conveyer for conveying abrading material received in said hopper to the aforesaid elevated receptacle therefor, substantially as set forth.

10. In an abrading mechanism, the combination of a support or holder for the article to be abraded, a tube or duct, a delivery-nozzle connected with said tube and adapted to travel from end to end of the said holder, means for rotating the holder about the axis of the delivery-tube, a receptacle for abrading material, a flexible tube for conveying such material to said delivery-tube, means for supplying a blast of air to said tube, a hopper arranged below the holder to receive the abrading material escaping from the nozzle, and a pneumatic conveyer for conveying said material received in said hopper to the aforesaid receptacle therefor, substantially as set forth.

11. In an abrading mechanism, the combination of a rotary support or holder for the articles to be abraded, two oppositely-extending tubes or ducts each provided at one end with a nozzle, means for moving said tubes and nozzles longitudinally of the holder, means for supplying each of said tubes with a blast of air, elevated tanks or receptacles, M, for abrading material, means for conducting material from said receptacles to the aforesaid tubes, hoppers arranged below the holder or support, boots, L, at the lower ends of the hoppers, ducts, *l*, connecting the boots, L, and elevated receptacles, M, a fan, N, and ducts connecting the casing of said fan with the said elevated receptacles, M, substantially as set forth.

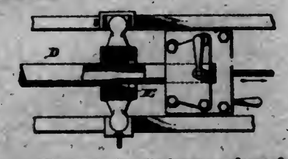
12. In an abrading mechanism, the combination of the rotary holder, the reciprocating truck, a receptacle on the truck for holding air under pressure, the duct leading from said receptacle, a nozzle carried by the duct, and means for supplying said duct with abrading material, substantially as set forth.

13. In an abrading mechanism, the combination of the rotary holder, the trucks arranged on opposite sides of the holder and traveling together, delivery-tubes extending from the trucks beyond the ends, respectively, of the rotary holder, and means for supplying said tubes with a blast of air charged with abrading material, substantially as set forth.

14. In an abrading mechanism, the combination of a rotary holder, the trucks arranged beyond the ends of the holder and traveling together in similar directions, delivery-tubes extending from the trucks beyond the adjacent ends, respectively, of the rotary holder, means connecting the adjacent ends of said ducts, and means for supplying a blast of air charged with abrading material to said ducts, substantially as set forth.

15. In a tube-cleaning machine, the combination with means for supporting and imparting rotation to one or more tubes, of a blast-nozzle, means for moving the said nozzle longitudinally of the said tube or tubes while rotating, and means for supplying said nozzle with a stream of abrading material, substantially as set forth.

16. In an abrading mechanism, the combination of a rotating barrel or cylinder adapted to receive a series of articles to be abraded, a delivery-nozzle within said cylinder, means for supplying said nozzle with a blast of air charged with abrading material, and means for supporting each of the articles within the barrel out of contact with the others therein; substantially as set forth.



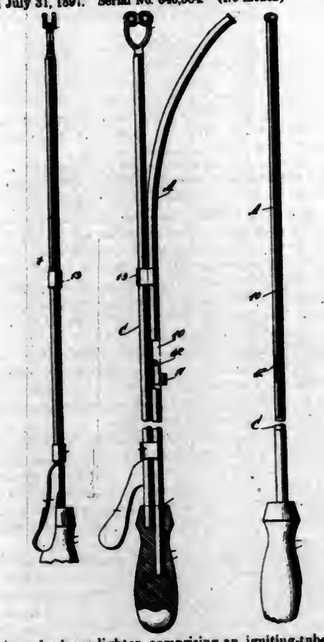
17. In an abrading mechanism, the combination of a rotatable support, a delivery-nozzle, means for supplying said nozzle with a blast of air charged with abrading material, and means for holding the article to be abraded out of contact with said support while moving therewith; substantially as set forth.

18. In an abrading mechanism, the combination of a rotatable cylindrical support, a delivery-nozzle arranged within and adapted to travel longitudinally of said support, means for supplying said nozzle with a blast of air charged with abrading material, and means adapted to engage the article to be abraded and hold the same out of contact with the wall of said rotatable support; substantially as set forth.

19. In an abrading mechanism, the combination of a holder for the article to be cleaned, blast devices, a nozzle for guiding and directing the blast against the article to be acted on, means for supplying abrading material to the blast in rear of the nozzle, and means for moving the nozzle longitudinally of the article to be cleaned to direct the blast against all points in the length thereof which it is desired to clean, substantially as set forth.

20. In a mechanism for removing scale from tubes, bars, or rods, the combination of a holder adapted to hold the article to be cleaned in a horizontal position, blast devices having a discharge-pipe extending parallel with the article to be cleaned, and having a nozzle for directing the blast against said article, means for supplying abrading material to said discharge-pipe, and means for moving said pipe longitudinally whereby the nozzle will direct the blast of abrading material against every point in the length of the exposed surface of the tube, bar, or rod which it is desired to clean, substantially as set forth.

602,850. METHOD OF MANUFACTURING COLD-DRAWN STEEL TUBING. WILLIAM A. McCOOL, Beaver Falls, Pa. Filed Dec. 3, 1897. Serial No. 660,671. (No specimens.) Patented in England Nov. 14, 1896, No. 25,686.



Claim.—1. The herein-described process of manufacturing seamless, drawn, steel tubing, which consists in first forming a plate of steel, heating said plate, bending it transversely, welding together its longitudinal edges, and then cold-drawing the tube thus produced through a die of a diameter slightly less than that of the tube and thereby mechanically dislodging the scale, silicates, &c., on the interior surface of the tube, subsequently cleansing the interior, and thereafter subjecting the tube to external and internal radial pres-

sure to reduce it in thickness and obliterate the seam, substantially as set forth.

2. The herein-described process of forming cold drawn steel tubing, which consists in subjecting a tubular blank having a weld extending along a longitudinal line, to the compressing action of a die slightly smaller in diameter than the tube, crushing or dislodging the scale and silicates from the interior surface by such die, and subsequently reducing the tube in thickness by external and internal compression, and obliterating the said weld, substantially as set forth.

602,351. GAS-LIGHTER. THOMAS N. McNISH, Kearny, N. J.
Filed July 31, 1897. Serial No. 646,584. (No model.)

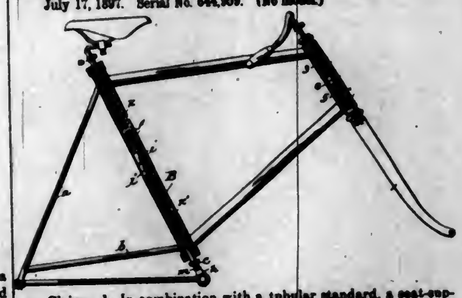
Claim.—1. A gas-lighter, comprising an igniting-tube having a handle at one end and provided with external bearings, and a rod mounted to turn in the bearings of the igniting-tube and provided with a key at its upper end and a thumb-piece at its lower end said thumb-piece extending downwardly adjacent to the handle of the igniting-tube, substantially as described.

2. In a gas-lighter, the combination, with a handle, and an igniting-tube secured to the said handle, of a rod held to turn in guides carried by the igniting-tube and also held to turn in the said handle, a key attached to the upper end of said rod, and a thumb-piece extending from the lower end of the key-rod adjacent to said handle, for the purpose specified.

602,352. MUSICAL INSTRUMENT. FRANK G. MCPHERSON, Beaver Falls, Pa., assignor of one-half to George W. Miller, Rochester, Pa.
Filed Apr. 27, 1897. Serial No. 634,075. (No model.)

Claim.—1. In a musical instrument of the harp or cithern class, a shield or cover-plate arranged to cover the end portions of the strings tuned for sharps and flats, the natural strings being above this cover-plate.

2. An instrument of the harp or cithern class having at the front thereof a bridge provided with depressed portions for the strings tuned to sharps and flats, and a shield arranged to cover the end portions of such strings adjacent to the bridge.



602,353. CANVAS-STRETCHER. JOHN W. HUBER, New York, N. Y.
Filed July 1, 1897. Serial No. 643,162. (No model.)

Claim.—1. A stretcher-key comprising a metallic plate provided with a right-angled, inturned flange, and with slots extending parallel with the flange, and ribs extending parallel with the slots, substantially as described.

2. The combination with a frame provided, at its corners, with grooves, of a key comprising a metallic plate provided with a right-angled, inturned flange, to bear against the inner walls of a corner of the frame, and with slots extending parallel with the flange, two ribs extending parallel with the slots for engaging the said grooves, and screws passed through the slots, substantially as described.

602,354. BICYCLE. GEORGE P. OHLHART, Baltimore, Md.
Filed July 17, 1897. Serial No. 644,969. (No model.)

Claim.—1. In combination with a tubular standard, a seat-supporting rod extending through the same, a spring sustaining the rod, reaches carrying the crank-box having pivotal connection with the rear axle and a freely-movable connection between the reaches and the lower end of the seat-supporting rod, substantially as described.

2. In a bicycle or the like a tubular standard, a spring-supported rod for the seat extending through the said standard, reaches carrying the crank-box pivotally connected with the rear axle and a double-jointed turning connection between the reaches and the lower end of the rod directly in line therewith, substantially as described.

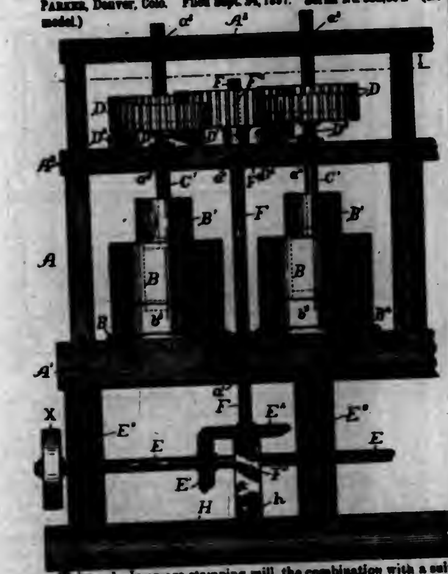
3. In combination in a bicycle, a spring-supported rod, reaches connected thereto having forked ends pivotally connected to the rear axle, said axle being adjustable longitudinally of the forked ends within the same, substantially as described.

4. In combination in a bicycle, the rear axle, the sleeves carried by said axle adapted to have free turning movement, the reaches connected to said rod having forked ends fitted on said sleeves, said sleeves being flattened to prevent them from turning within said forks, and means for clamping said forks rigidly to said sleeves, substantially as described.

602,355. PENCIL. WILLIAM PAINTER, Baltimore, Md.
Filed Jan. 19, 1894. Serial No. 497,494. (No model.)

Claim.—1. A marking-point carrier or magazine for use in pencil-cases, provided with sockets having a yielding wall adapted to frictionally engage with marking-points for securely holding the same, and adapted as a whole to be inserted in and removed from a pencil-case substantially as described.

2. The combination with a suitable pencil-case having a suitable marking-point tip, of a readily-detachable magazine within the case provided with grooves or sockets having a yielding wall adapted to frictionally hold and control a reserve marking-point, substantially as and for the purposes specified.



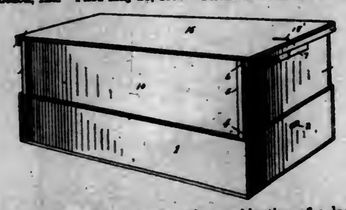
3. A marking point magazine or carrier for use in pencil cases, provided with longitudinal sockets or grooves having yielding or resilient sides, substantially as described, whereby marking-points may be held and maintained in said grooves under yielding pressure, as and for the purposes specified.

4. The combination substantially as hereinbefore described, of a suitable pencil-case, of a slidably-detachable interior stem provided with sockets serving as parts of a magazine for marking-points, each socket having a yielding wall adapted to frictionally hold and maintain control over a reserved marking-point, substantially as and for the purposes specified.

5. The combination with a pencil-case provided with a suitable tip, of an interior stem slidingly adjustable within the case and separable therefrom and provided with an end or piston which serves to keep a detachable marking-point socketed within the tip, substantially as described.

6. The combination substantially as hereinbefore described, of a suitable pencil-case provided with an internally-tapered tip, and an interior stem carrying one or more magazines embodying frictional sockets for the reception and control of tapered leads or other marking-points, and provided at its inner end with a piston which serves to keep the service marking point socketed within the tip, substantially as and for the purposes specified.

602,356. ORE STAMPING AND CRUSHING MILL. EDWARD F. PARKER, Denver, Colo.
Filed Sept. 24, 1897. Serial No. 652,894. (No model.)



Claim.—1. In an ore-stamping mill, the combination with a suitable frame; a horizontal shaft journaled in said frame, and a pulley fixed thereon; a bevel-gear fixed on said shaft; a vertical shaft journaled in said frame; a bevel-gear fixed on said vertical shaft and meshing with the bevel-gear on said horizontal shaft; and a wide-faced cog-wheel also fixed upon said vertical shaft; of a plurality of vertical shafts journaled in said frame around said vertical shaft, and capable of vertical movement; cog-wheels fixed upon said vertically-movable shafts, and each having a cam on its under side; rollers mounted upon said frame beneath said cog-wheels and adapted to be struck by said cams as the wheels rotate; a plurality of shells for holding the ore while being stamped mounted in said frame, and plunger-heads connected to said vertically-movable shafts mounted in said shells, substantially as described.

2. In an ore-stamping mill, the combination with a vertical shaft and means for rotating the same; a wide-faced cog-wheel fixed on said vertical shaft and having a rotation constantly in the same horizontal plane; of a plurality of shells grouped around said vertical shaft; plunger-heads mounted in said shells; vertical shafts having screw-threaded ends engaging in said plunger-heads and working through openings in said shells; cog-wheels mounted upon said vertical shafts and meshing with said wide-faced cog-wheel; rollers journaled in brackets mounted upon the frame of the mill beneath the cog-wheels on said plunger-shafts; and cams D' on the under side of said wheels adapted to slide over said rollers as said wheels rotate, and to impart to said plunger-shafts a vertical movement in addition to the rotary movement imparted by the said wide-faced cog-wheel, substantially as described.

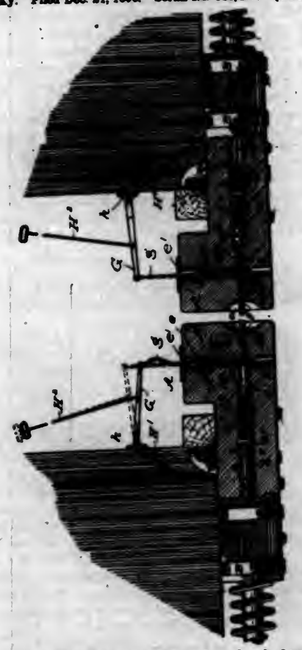
3. In an ore-stamping mill, the combination with a horizontal shaft, and means for rotating the same; a bevel-gear on said shaft; a vertical shaft, a bevel-gear fixed on said vertical shaft and gearing with the bevel-gear on said horizontal shaft; the wide-faced cog-wheel F^2 fixed on said vertical shaft and adapted to rotate constantly in the same horizontal plane; a plurality of shells grouped around said vertical shaft; plunger-heads mounted in said shells; vertical shafts having screw-threaded ends engaging in said plunger-heads and working through openings in said shells; cog-wheels mounted upon said vertical shafts and meshing with the cog-wheel F^2; rollers journaled in brackets mounted upon the frame of the mill beneath the cog-wheels upon said plunger-shafts; and cams D' on the under side of said wheels adapted to slide over said rollers as said wheels rotate, and to impart to said plunger-shafts a vertical movement in addition to the rotary movement imparted by the cog-wheel F^2, substantially as described.

4. In an ore-stamping mill, the combination with a suitable frame; a horizontal shaft journaled in said frame, and a pulley fixed thereon; a bevel-gear fixed in said horizontal shaft; a vertical shaft also journaled in said frame; a bevel-gear fixed on said vertical shaft and meshing with the bevel-gear on said horizontal shaft; and a wide-faced cog-wheel F^2 rigidly mounted upon said vertical shaft; a plurality of hollow shells B each having reduced cylindrical upper portions B' with central opening b^2 therein, mounted upon a solid metallic base B^2 seated upon said frame; a die seated in a recess in the upper face of said base B^2; a funnel-shaped wire-netting in each of said shells surrounding said die at its lower edge and adapted to receive the uncrushed ore at its top through an opening in the larger portion of said shell; a solid plunger-head provided with a hardened shoe at its lower end mounted in each of said shells; a vertical shaft having a screw-threaded end engaging in each of said plunger-heads; a cog-wheel fixed upon each of said shafts and meshing with said cog-wheel F^2; a roller journaled in a bracket mounted upon the frame beneath each of said cog-wheels; and a cam on the under side of each of said cog-wheels adapted to slide over said rollers, and impart to said shafts a vertical movement, substantially as described.

602,357. COLLAPSIBLE SHIPPING-CRATE. WILLIS O. PARKER, Leach, Ind.
Filed May 28, 1897. Serial No. 638,583. (No model.)

Claim.—In a shipping-crate, the combination of a lower body portion, detachable side and end pieces, the said end pieces having openings, staples and outer strips forming guides, and the sides provided with pins to engage the said openings, pairs of staples located on the inner portion of the said sides, a removable partition adapted to engage the said pairs of staples, and a removable lid or cover, substantially as and for the purposes specified.

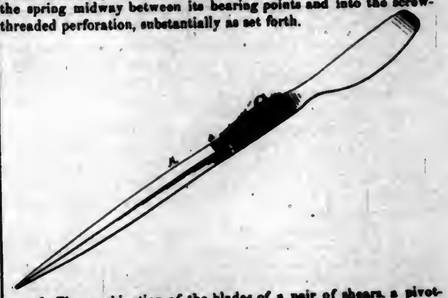
602,358. GAME-BOARD. WILLIAM H. PERRY, Hamilton, Canada.
Filed July 15, 1897. Serial No. 644,603. (No model.)



Claim.—1. A game-board having side and end rails, a series of holes located adjacent to an end rail, a triangular block at the center of said rail and projecting inwardly therefrom, and triangular blocks located in front of the holes and slightly separated, substantially as specified.

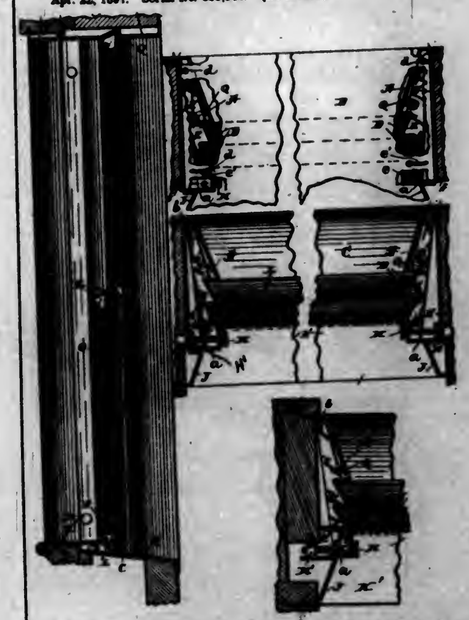
2. A game-board having side and end rails and a series of holes adjacent to one of the end rails, a triangular block extending inward from the end rail, triangular blocks located in front of the holes, and slightly separated, and rails or strips extending inwardly from the side rails and forming receptacles or pockets for the reception of balls designed to be employed in connection with the game-board, substantially as specified.

3. A game-board having side and end rails and a series of holes adjacent to one of the end rails, a transverse strip forming the bottom of the holes and having characters imprinted thereon, a triangular block extending inwardly from the end rail, triangular blocks located in front of the series of holes, and slightly separated, and rails extending inwardly from the side rails and forming receptacles or pockets for the balls, designed to be employed in connection with the game-board.



602,359. CAR-COUPLING. WILLIAM C. PERKINS, Rocky Hill Station, Ky. Filed Dec. 21, 1896. Serial No. 616,477. (No model.)

Claim.—A car-coupling comprising a draw-head of two sections divided horizontally and longitudinally, a groove in the meeting sides of each section, a plate secured to the upper section having a depending flange extending into the recess formed by the sections, a propeller-block located in the recess having a stem projecting through the depending flange, a spring encircling the stem and interposed between the flanges and the propeller-block, a vertical orifice in the draw-head, and a pin housed in the orifice, substantially as described.



602,360. SHEARS. ANTON PROHASKA, Philadelphia, Pa. Filed Dec. 31, 1896. Serial No. 617,696. (No model.)

Claim.—1. The combination of the shear-blades, a pivot therefor, one of said blades having two perforations back of the pivot, one perforation being plain and the other screw-threaded, a block resting in the plain perforation and bearing upon the other blade, a spring-plate resting upon the block and upon the perforated blade back of the screw-threaded perforation, and a regulating-screw passing through the spring midway between its bearing points and into the screw-threaded perforation, substantially as set forth.
